Quinia is employed not merely in the cure of disease, but for the preservation of the health, when the system is exposed to certain noxious influences. Its value as a means of guarding the system from the attack of intermittent fever is so generally recognized, that our admiralty regulations require that every man should take quinia when the ship is within a certain distance of the e. and w. coast of Africa, and that it should be regularly continued in eight-grain doses every morning to those engaged in boat-cruising along the coasts or on the rivers or creeks. The author of *A Visit to the Cities and Camps of the Confederate States*, in *Blackwood's Magazine* for Jan., 1865, observes, that formerly it was considered certain death to sleep out for one night on James's island, opposite Charleston, during the malaria season; when he wrote, thousands of men were quartered on it. In 1863, when the taking of quinia was optional, there was a great deal of fever; in 1864, all were compelled to take their dose regularly every morning, and they were very healthy. It would appear, however, that quinia is not equally efficacious in guarding the system against all forms of intermittent fever, for Mr. Meller, surgeon-naturalist in medical charge of Dr. Livingstone's Zambesi expedition, found a glass of rum given at sunrise to be "a far better prophylactic" than quinia in the fever of e. central Africa.

QUINISEXT (Lat. *quinque*, five, and *sex*, six), the name given to a council which, being regarded as a sort of supplement of the fifth and sixth generals, is called by a title which appears to combine both. In the same view, it is called by the Greeks *penthakte* (from *pente*, five, and *hekte*, sixth). The fifth general council, held in 553, on the subject of the three chapters (q. v.), enacted no canons of discipline. In like manner the sixth, held against the Monothelites in 680, was confined almost entirely to doctrinal decisions. In order to supply the want, a numerous body of bishops, 211 in number, assembled in 692, in a hall of the imperial palace at Constantinople, called the Trullus. It was a purely oriental council, and not only was not approved by the western church and the pope, but was almost immediately reprobated. Its decrees are purely disciplinary; and it is chiefly important as being the council in which was laid down the broad distinction between the legislation of the east and that of the west on the subject of clerical celibacy. The quinisext council, while prohibiting the marriage of any one who is in priest's orders, permits a married man to receive after marriage the order of subdeacon, deacon, or priest, but not of bishop. Against this the Roman pontiffs vigorously protested. Another peculiar canon of this synod (57th) prohibits fasting on Saturday, even though in Lent. On these and other points of difference in discipline no agreement has taken place between the churches down to the present time.

* Mr. Desvignes (in a *Memoir* communicated on Jan. 10, 1865, to the royal medical and chirurgial society) advocates the administration of solutions of quinia by subcutaneous injection. The solution he employed was a grain and a half in 15 drops of water, acidulated with a drop of dilute nitric acid. With this he successfully treated several hundred cases of intermittent fever in the district of Tuscany, known as the "Maremma," in many of which the use of quinia and arsenic, administered in the ordinary way, had failed to effect a cure.

QUINOA, *Chenopodium Quinoa*, an annual plant, a native of Chili and the high tableland of Mexico. It much resembles some of the British species of *chenopodium* (q. v.), has an erect stem, with ovate, angulate-toothed leaves, the younger ones pulverulent, and panicles much crowded and branched. In the countries in which it is indigenous, it is much cultivated for its seeds, which form the principal food of the inhabitants. The meal made from some varieties of the seed has a somewhat peculiar flavor, but it is very nutritious. Quinoa meal resembles that of oats in not becoming elastic and tenacious when mixed with water, and like oatmeal, can only be made into cakes, not into leavened bread. The plant is sometimes cultivated in our gardens for its leaves, which are a good substitute for spinach.

QUINOLINE. See **LEUCOL**, *ante*.

QUINQUAGESIMA SUNDAY (Lat. fiftieth), the Sunday immediately preceding Ash-Wednesday.

QUINQUEN NIAL PRESCRIPTION, a period of five years allowed by the law of Scotland within which payment of sums on all bargains concerning movables, arrears of rent in some leases, multures, ministers' stipends, arrestments, must be enforced.

QUINQUEREMES, vessels with five banks of oars, however arranged (see **TRIREME**), may be regarded as the first-rates of the ancient navies. The Greek states used them after the death of Alexander, and the Carthaginians a little later. A Carthaginian vessel of this class served during the first Punic war as a model to the Romans, who built 100 on the coast of Bruttii in the year 266 B. C., and thenceforward maintained fleets of such ships. According to Polybius, a quinquereme carried 300 seamen and 120 soldiers.

QUIN SY, or **COMMON INFLAMMATORY SORE THROAT**, known also as **CYNANCHE TONSILLARIS** and **TONSILLITIS**, is an inflammatory affection of the substance of the tonsils (q. v.). The inflammation is, however, seldom limited to these glands, but extends to the uvula, the soft palate, the pharynx, and not unfrequently the salivary glands. The disease usually manifests itself by difficulty in swallowing, and a sense of heat and discomfort in the throat, often amounting to considerable pain. On examination the throat at first exhibits unnatural redness, with enlargement of one or both tonsils. The uvula is enlarged and elongated; its end either dropping down into the pharynx, and by exciting the sensation of a foreign body, giving rise to much irritation, or else adhering to one of the tonsils. The tongue is usually furred, and the pulse rapid, and there are the ordinary symptoms of that form of constitutional disturbance known as inflammatory fever. The inflammation terminates either in resolution (if the attack is not severe, and yields readily to treatment) or in suppuration, which may be detected by the occurrence of slight rigors, and by the increased softness of the enlarged tonsil. The matter which is discharged has a very fetid smell, and the fetor is often the first indication of the rupture. The pain almost entirely ceases with the discharge of matter, and recovery is then rapid. The disease is usually at its height in about a week after the manifestation of the first symptoms, and it almost invariably terminates favorably. The ordinary exciting cause of this disease is exposure to cold, especially when the body is warm and perspiring; and certain persons (or even families) are so subject to it that slight exposure is almost sure to induce it.

The disease may sometimes be cut short if, at its very commencement, a sharp purgative (as, for example, compound infusion of senna with Epsom salts) be administered, followed up almost immediately by an emetic of a scruple of ipecacuanha with a grain of tartar emetic. The patient should remain in the house (or in cold weather, even in bed), and should be kept on low non-stimulating diet. A stimulating liniment, such as the compound camphor liniment, should be applied to the outside of the throat, and the neck should be surrounded with a piece of flannel. In mild cases the above described treatment is sufficient. In more severe cases the patient may gargle frequently with hot water, or milk and water, or, which is better, may inhale the vapor of boiling water. Blistering and leeching will sometimes give relief, but if suppuration is once established, they do harm rather than good. If the tonsils are very much enlarged they should be pricked with a lancet made expressly for the purpose.

Dr. Trench, in his *English Past and Present*, gives quinsky (or quinsey, as he spells it) as an example of the gradual recasting of a foreign word into a new English mold. The Greek word *cynanche* was the origin of the French *esquinancie*, which entered the English language as *quinancy*, became *quinzey* in the time of Jeremy Taylor, and has now softened down to *quinsky* or *quinsey*.

QUINT, ALONZO HALL, D. D., b. N. H., 1828; graduated at Dartmouth college in 1846, and Andover theological seminary in 1852; was pastor of a Congregational church at Roxbury, Mass., 1853-63; in the Massachusetts board of education, 1855-61; chaplain of the 2d Massachusetts volunteers, 1861-64. After the war he became pastor of the North Congregational church, New Bedford. He is a vigorous and interesting writer, and has published *Army Notes and History of the Second Massachusetts Regiment*; was editor of the *Congregational Quarterly*, and has written frequently for religious periodicals. He was one of the most prominent army chaplains in the war. As a statistician and genealogist he ranks high; the Congregational churches owe much to his skill and

industry in the former relation. He is now engaged in preaching and in literary work, near Boston.

QUINTAL, a French weight corresponding to the English "hundred-weight," was equal to 100 pounds (livres); on the introduction of the metrical system, the same name was employed to designate a weight of 100 kilograms (see METRIC SYSTEM). The metrical quintal is thus more than twice as heavy as the old one, and is equivalent to 220 lbs. avoirdupois.

QUINTANA, MANUEL JOSÉ, surnamed the "Spanish Tyrtaeus," was b. at Madrid, April 11, 1772, studied at Salamanca, and established himself as an advocate in his native city, where his house became a resort of the advanced liberals of the time. Among his earliest productions were his *Odes*, which gave him a place in the first rank of Spanish poets. On the outbreak of the war of independence, he made good use of his lyric gift to stimulate the patriotism of his countrymen, and otherwise distinguished himself as editor of the *Semanario Patriótico*, and author of the manifestoes of the insurrectionary juntos, and of most of the official statements of the first Cortes. Meanwhile, he did not abandon literature, properly so called. Besides his Spanish Plutarch (*Vidas de los Españoles Cebres*, Madr. 1808-34), a work which is reckoned one of the finest Spanish classics, he published one or two tragedies, and an excellent selection of Castilian poetry (*Poesias Selectas Castellanas*, 3 vols. Madr. 1808). On the restoration of Ferdinand VII. in 1814, Quintana's liberalism caused his imprisonment for six years. On his release in 1820 he was received in Madrid with acclamations, and appointed president of public instruction. But his enthusiasm in the cause of liberty was now considerably quenched, and in its place appeared a spirit of subservience to royalty which greatly detracted from his previously patriotic character. In 1835 he was reappointed director-general of public instruction, an office which he held till 1851. He was also made a peer and a senator, and acted as tutor to the young queen Isabella from 1840 to 1843. On Mar. 25, 1855, Quintana was honored with a public ovation in Madrid, had a speech made to him by the cortes, and a crown of golden laurel placed on his brows by the hand of Isabella herself. He died Mar. 11, 1857. Quintana's works are to be found collected in the *Biblioteca de Autores Españoles* of Rivadeneyra (Madr. 1852).—See Kennedy's *Modern Poets of Spain*, and Ticknor's *History of Spanish Literature*.

QUINTARD, CHARLES TODD, D.D., LL.D., b. Conn.; took medical degree at the university of New York in 1846; became physician of the New York dispensary in 1847; professor of physiology and anatomy in the Memphis medical college in 1851; ordained in the Protestant Episcopal church in 1855; became rector of the Church of the Advent in Nashville in 1858; consecrated bishop of Tennessee in 1865. He is the author of *A Plain Tract on Confirmation*; *A Preparation for Confirmation*. In early life he contributed to medical periodicals. He was a strong secessionist and a chaplain in the rebel army.

QUINTESSENCE (Lat. *quinta*, fifth, *essentia*, essence) signifies literally the fifth essence. The word is of ancient origin, and dates from the time when it was generally believed that the simple elements or constituents of bodies were *four* in number, viz., fire, air, earth, and water, and that earth was the lowest element, being grosser than water, water than air, and air than fire. Some Pythagorean philosophers, not satisfied that these four elements or essences sufficed for the composition of all substances in nature, added to them a fifth element or essence, *ether*, which was supposed to be more subtle and pure than fire (the highest of the four), and was therefore located in the uppermost regions of the sky. The word "quintessence" has thus come down to us in the signification of the most subtle ingredient or extract of any body, though in ordinary language it is employed in a figurative sense. See ALCHEMY.

QUINTET, a musical composition for five voices, or for five instruments, each of which is *obligato*. The most remarkable quintets for stringed instruments are those of Boccherini, Mozart, Beethoven, and Onslow; and for wind instruments (the flute, oboe, clarinet, horn, and bassoon), those of Reicha.

QUINTILIAN (QUINTILIANUS, M. FABIVS) was b. 40 A.D., at Calagurris (the modern Calahorra) in Spain, and attended in Rome the prelections of Domitius Afer, who died 59. After this date, however, he revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practice as an advocate, in which capacity his reputation became considerable. He was more distinguished, however, as a teacher than as a practitioner of the oratorical art, and his instructions came to be the most eagerly sought after among all his contemporaries, while among his pupils he numbered Pliny the younger and the two grand nephews of Domitian. As a mark of the emperor's favor he was invested with the insignia and title of consul; while he also holds the distinction of being the first public teacher who benefited by the endowment of Vespasian and received a fixed salary from the imperial exchequer. His professional career as a teacher of eloquence, commencing probably with 69, extended over a period of 20 years, after which he retired into private life, and died probably about 118. The reputation of Quintilian in modern times is based on his great work entitled *De Institutione Oratoria Libri XVII.*, a complete system of rhetoric, which he dedicates to his friend Marcellus Victorius, himself a court favorite and orator of distinction. It was written (as he tells us in his preface to his bookseller Trypho) after he had ceased to be a public teacher;

and was the fruit of two years' labor. During its composition, however, he was still acting, in the lifetime of Domitian, as tutor to the grand-nephews of that emperor. In the first book, he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator, and he gives us an elaborate outline of the mode in which children should be educated in the interval between the nursery and the final instructions of the grammarian. The second book treats of the first principles of rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while those of the eighth, ninth, tenth, and eleventh are composition (embracing the proper use of figures of speech) and delivery. The last, and, in the author's view, the most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to adopt, the age at which pleading should be begun, and at which it should be left off, and other allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, and the perfect familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences, has always been admired for its correctness and animation. The declamations, amounting to 164, which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs. There is better ground, however, for ascribing to him the anonymous *Dialogus de Oratoribus*, often included in editions of Tacitus. The best editions of Quintilian are those of Burmann (Leyden, 1720); and of Spalding and Zumpt (Leip. 1798-1829).

QUINTIN MATSYS, a celebrated painter of the early Flemish school. He was b. at Antwerp about 1460, and is generally known by the name of the blacksmith of Antwerp, from having followed that trade in early life. The romantic story so long connected with this artist's name, of his having adopted the profession of painting in order to obtain the hand of a painter's daughter, is founded on nothing more authentic than the verses of Lampsonius, affixed to his portrait by Jerome Coek (1510-70), and the inscription on his monument in the cathedral at Antwerp, "Connubialis Amor de Mulcibere fecit Apellem." The fact of his admission into the painters' fraternity of St. Luke in 1491-92, is proved by an entry in the register of that body. It appears from two authentic documents that he was alive on July 8, 1530, but had died previous to Oct. 12, 1531. In the works of this distinguished painter, art is exhibited as transitional between the style of Van Eyck and Rubens—his aim being, without neglecting the accessory details, to give more importance to the human figure, and more unity and effect to the general composition of his picture. Albert Dürer and Holbein thought highly of his works; among them, the best is an altar-piece with two folding-doors or wings, at one time in the cathedral, now in the picture-gallery at Antwerp, and one of the *chefs-d'œuvre* of that collection. It is specially referred to by sir Joshua Reynolds in his Notes on his Tour through Flanders and Holland. Quintin Matsys was on intimate terms with Erasmus, sir Thomas More, and Petrus Ægidius. Many elaborate specimens of ornamental iron-work are attributed to this artist; but from the facts connected with his career as a painter, it may be inferred that he merely furnished designs for the works in iron referred to.

QUINTIN, or **QUINTAINE**, was an instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post, surmounted by a cross-bar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that the rider was past before the bag of sand, as it whirled round, could hit him on the back.

QUINTUPLET, in music, a rhythmical group of five notes, formed of a note divided into five instead of its proper complement of four parts; the five notes having collectively the value usually expressed by four such notes. Thus, the five semiquavers of the group are equivalent in value to one crotchet, or four ordinary semiquavers.

QUINTUS CURTIUS RUFUS, the Roman historian, flourished probably in the time of Vespasian; while a less plausible conjecture represents him as having lived in the reign of Constantine. Nothing further is known or can even be fairly surmised regarding his life. His work entitled *De Rebus Gestis Alexandri Magni Regis Mæcedonum* consisted of ten books; but of these the first two are lost, and the other eight are occasionally imperfect. Its style is flowing and ornate, but it wants the pure Latinity of Cicero, and the simplicity of Cæsar. Along with the Greek history of Arrian, it forms our most valuable source of information respecting the military career of Alexander the great, although it is not entirely free from geographical, chronological, and strategical blunders. The best edition is that of Zumpt (Brunswick, 1849).

QUIRE (*Fr. cahier*) of paper, consists of twenty-four sheets, each doubled once, and one placed within the other.

QUIRINUS was, among the Sabines (and according to Mommsen, among the Latins also), a surname of Mars, and is probably derived from the Latin word *quiris*, a spear. It is therefore equivalent to the "spear-bearer." According to the ancient legend, the

name was first given to Romulus (q. v.), as the son of Mars, after his apotheosis, and the festival instituted in his honor was called the *Quirinalia*.—The QUIRINAL (Lat. *Collis Quirinalis*) is one of the seven hills on which ancient Rome stood, and, next to the Palatine and Capitoline, the oldest and most famous quarter of the city. It lies due n. of the Palatine, and its western slope looks down on the Campus Martius, which stretches from its base to the banks of the Tiber. According to the ancient legend, it was the seat of the Sabine portion of the mixed population of early Rome; but this idea is strongly combated by Mommsen, who rejects as a "baseless speculation" the "etymologico-historical hypothesis started by Varro, and, as usual, unanimously echoed by Latin writers, that the Latin *quiris* and *Quirinus* are akin to the Sabine town *Cures*, and that the Quirinal Hill accordingly had been peopled from *Cures*" (*History of Rome*, vol. i.). The most notable structures on the Quirinal were the temple of *Quirinus*, said to have been built by Numa in honor of Romulus, the temples of *Flora*, *Salus*, *Fortuna*, and *Sol*. Here, also, were the famous gardens of Sallust (*Horti Sallustiani*), the *circus Floræ*, the *circus Sallustii*, the baths of Diocletian, and the Praetorian camp.

QUIRITES (probably from *quiris*, the Sabine name for a spear), the collective name of the Romans in their civil relations, while in their military and political capacity they were known as *Romani*. The title dates back to the time of Romulus, when a large part of the Sabines having united themselves with the Romans, out of compliment to them the Roman *citizens* were given the Sabine name of Quirites. This is Livy's explanation, but the modern theory is more probable, that the Quirites was the original name of the Sabine tribe, and that the new nation was called indifferently by the name of either of its component parts. A distinction, however, gradually crept in as to the use of the term Quirites, and while always a title of honor as applied to the Roman citizens, and so used in all public speeches and addresses, in the army it became a term of reproach, implying that he to whom it was given was no true soldier, but fit only for a civilian.

QUIRK, a small angle or recess between moldings. It is much used in Greek and Gothic architecture, and sometimes in Roman.

QUIS CALUS, a genus of birds of the family *sturnidae*, having the tail longer than in the starlings (*sturnus*), and graduated—the middle feathers longest—its sides turned up. From this last character, some of the species are often called BOAT-TAIL. The great boat-tail, or great crow blackbird (*Q. major*), a bird about 16 or 17 in. long, is common in the southern parts of North America.—More common, and indeed abundant in all parts of the United States, is the PURPLE GRACKLE, or CROW BLACKBIRD (*Q. versicolor*), a bird about 12 in. in length, tail included; black, with reflections of blue, violet, etc. Vast flocks of this species are to be seen at the seasons of migration in some parts of North America. Its migrations extend to very northern regions in summer. It is to be found in Louisiana at all seasons. Its depredations in fields of maize and other kinds of grain, make it an object of especial dislike to North American farmers. Its flesh is dry and coarse, although often used for food; but its eggs are esteemed a delicacy.

QUITCH. See COUCH GRASS.

QUI TAM actions are actions so called in the law of England from the first words of the old form of declaration by which informers sue for penalties, the plaintiff describing himself as suing as well for the crown as for himself, the penalty being divided between himself and the crown.

QUITCLAIM, in law, a conveyance with both words of grant and release; a deed in the nature of a release. It indicates either an existing estate, or a previous conveyance, and though regarded as a conveyance at common law, is held in some of the states to be an original conveyance. The word is, however, employed constantly in American law, with the same meaning as a release in the law of England. It derives its effect from the words "remise, release, and forever quitclaim."

QUITMAN, a co. in w. Georgia, adjoining Alabama, drained by Chattahoochee river and Pataula creek; traversed by the Southwestern railroad; about 205 sq. m.; pop. '80, 4,392—4,386 of American birth. The surface is level, and heavily timbered. The soil is fertile. The principal productions are corn and cotton. Co. seat, Georgetown.

QUITMAN, JOHN ANTHONY, LL.D., 1799—1858; b. N. Y.; tutor at Hartwick academy, near Cooperstown, in 1815; professor of English literature at Mount Airy college, Germantown, Penn., in 1817; walked to Chillicothe, Ohio, in 1818, and entered a law office, supporting himself by teaching; afterward a clerk in the U. S. land office, Delaware, Ohio, and admitted to the bar. In 1821 he removed to Natchez, Miss.; was elected in 1827 member of the legislature, and became prominent in the politics of the state; chancellor of the superior court 1828—31 and 1832—34. In 1834 he was chosen president of the state senate. In 1836, withdrawing from political life, he went with a small party to assist the Texans in their struggle for independence. On the capture of Santa Anna he returned to Natchez, resumed his law practice, and filled several important public positions, besides superintending large sugar and cotton plantations. In 1829 he visited Europe, and on his return was appointed judge of the high court of errors and appeals. In July, 1846, he was appointed by president Polk brig. gen. of volunteers in

the U. S. army; distinguished himself at Monterey by a successful attack on fort Ten-erice; commanded at the siege of Vera Cruz, and after the battle of Cerro Gordo was part of the advance under gen. Worth that took the city of Pueblo. He was brevetted maj.gen. for gallantry at Monterey, and received a sword from congress. He distinguished himself at Chapultepec and the Belen gate, and was appointed by gen. Scott governor of the city of Mexico. In 1850 he was elected governor of Mississippi. He was charged with combining with gen. Lopez to organize an expedition to Cuba; but evidence for the prosecution was lacking. In 1855 he was chosen to congress, and in 1857 re-elected, being put at the head of the military committee. He was prominent in debate, and a decided adherent of Calhoun and his political doctrines.

QUITO, the capital of Ecuador. (q.v.), and of the province of Pichincha, stands between two parallel ranges of the Andes on the e. side of the volcano of Pichincha (q.v.), at an elevation of 9,492 ft. above the sea, and in lat. $0^{\circ} 15' s$, long. $78^{\circ} 45' w$. Its site, in the midst of mountains, is very uneven; its appearance, however, is picturesque, and its beautiful environment of mountains, together with its clear, healthy, and temperate climate, averaging 60° Fahr., and described as an eternal spring, make it one of the most charming cities of South America. From the hills in the vicinity, a beautiful panoramic view, embracing eight icy peaks of the Andes, may be obtained; and to the s. of the city extends the lovely valley of Chillo, laid out in gardens. The chief edifices are built of stone, the others of adobes, or sun-dried bricks, covered with tiles. Quito contains many churches, monasteries, convents, two hospitals, two colleges, and several plazas or squares. By the earthquake of Mar., 1858, most of the then existing churches, convents, and government buildings, as well as many private residences, were thrown down, property to the value \$3,000,000 was destroyed, and many lives lost. From this calamity, the city has in great part recovered. Quito is the seat of the only archbishop in the country, and of the government. Coarse cotton and woolen goods and jewelry are manufactured, and the trade in grain, indigo, metals, and liquors is extensive. Pop. 76,000.

The most important events in the history of Quito are mentioned in the articles Ecuador and Peru (q.v.).

QUIT RENT is the small rent which is payable by the tenants of old manors, by which they go quiet and free. In old records, it is called *white* rent, because it was paid in silver money, as distinguished from corn rents.

QUITTOR. See **QUILTOR**, *ante*.

QUOIN (Fr. *coigne*, from Lat. *cu-neus* = Gr. *gonia*) is generally a wedge or an angle. In artillery, the quoin is a wedge inserted beneath the breech of a gun, for raising or depressing the muzzle. The Armstrong gun is elevated by a screw instead of a quoin; but considering the rough service of actual warfare, it is doubtful whether the clumsy quoin is not more to be depended on. Quoins on shipboard are wedges used to prevent casks from damaging each other.

QUOIN, in architecture, is one of the stones forming the solid corner of a building. Where the work is of brick or small materials, the quoins are usually of ashlar. They sometimes project, and are molded, when they are called "rustic quoins." See **RUSTICATION**.

QUOITS, a game much practised by the working classes in the mining districts of Great Britain, seems to have been derived from the ancient game of "throwing the *discus*," which was such a favorite amusement of the Greeks and Romans. The *discus* was a circular plate of stone or metal, 10 to 12 in. in diameter, and was held by its further edge with the right hand, so as to lean upon the fore-arm, and was cast with a swing of the arm, aided by a twist of the whole body. It was generally thrown edge foremost, and upward at an angle of 45° , so as to give it as great a range as possible, and the player who threw it farthest was the winner. Similar to this game was the "throwing of the *solos*," a heavy spherical mass of stone or iron, perforated through the center, to admit a rope or thong, by the aid of which it was thrown. In this game also the farthest throw was the successful one. It is still practised by the mountaineers of the Appenzell in Switzerland. The game of quoits differs very considerably from both of these. A quoit is a flattish ring of iron, generally from $8\frac{1}{2}$ to $9\frac{1}{2}$ in. in external diameter, and between 1 and 2 in. in breadth. It is convex on the upper side, and slightly concave on the under, so that the outer edge curves downward, and is sharp enough to stick into the ground. The mode of playing is as follows: Two pins, called "hobs," are driven into the ground from 18 to 24 yards apart; and the players, who are divided into two parties, stand at one hob, and in regular succession throw their quoits (of which each player has two) as near to the other hob as they can. The points are counted as in bowls or in curling. To facilitate the sticking of the quoits at the point where they strike the ground, a "clay end"—that is, a flat circle of clay, about 1 or 2 in. in thickness, and $1\frac{1}{2}$ ft. in radius—is placed round each hob. This requires to be kept moist, and should have sawdust strewn over it. The quoit, when to be thrown, is grasped with the right hand by one side, and pitched with an upward and forward jerk of the hand and arm, which give it a whirling motion, and cause it to strike the ground with its edge. Professional players acquire such dexterity in this game, that they can very frequently "ring" their quoit—that is, land it so that the quoit surrounds the hob.

QUORRA. See NIGER.

QUORUM (Lat. *quorum*, of whom) is a legal term, denoting a certain specified number out of a larger number as entitled or bound to act for certain purposes. Thus, in statutes appointing commissioners or trustees of a public work, it was usual to name a certain number of the whole body as sufficient to discharge the business, when it may be inconvenient for all to attend. In Scotland, the word is commonly used in reference to trustees appointed under trust settlements, when one or two individuals, either in point of number, or for some personal reason, must concur in formal acts. In England, the word is now seldom used except in regard to justices of the peace. It was an ancient practice of the crown to select a few of the justices, generally the most skilled in the law, and designate them as "of the quorum," so as to secure their presence on certain occasions when peculiar business requiring skill was to be done. This selection, however, by degrees came to be considered invidious; and by statutes of George II. and George III., it was expressly enacted that things which formerly required to be done only by justices of the quorum, might be done by ordinary justices. And latterly, the crown has made all the justices of the quorum, so as to put them all on the same footing.

QUOTIDIAN FEVER. See AGUE.

QUO WARRANTO is a writ or information issued from the court of queen's bench in Westminster, calling upon a person or body of persons to show by what warrant they exercise a public office or privilege. It is the legal mode of remedying any usurpation of privilege or of office.

R

R, THE eighteenth letter in the English and other western alphabets, is one of the group of liquids. See LETTERS. Its name in Hebrew was *resh*, meaning forehead, and the rude outline of a head is thought to be yet recognizable in the Phœnician form of the letter. Of all the consonants, R approaches most nearly to the vowels. In Sanskrit, there is an R-vowel distinguished from the R-consonant by a different character. The Greek, also, had two varieties of R, one with the "spiritus asper" (ρ), or rough breathing, at the beginning of words, and when following another R; and another with the weaker breathing (ρ) in other positions. The Romans in spelling Greek words represented the former by *r̄*, and hence we still write *Rhodes*, *rheumatism*, *catarrh*. This *r̄* was probably of the guttural kind commonly called a "burr." This enunciation of *r* occurs as a peculiarity of individuals everywhere, but it is universal in Northumberland and Durham, and characterizes the pronunciation of the letter in certain positions throughout Germany and Scandinavia. The normal pronunciation of R in English and in the Romanic tongues (and it appears to have been the same in Latin) is a vibratory sound produced by applying the tip of the tongue near the roots of the upper fore-teeth. From the resemblance to the growl of an angry dog, R was called by the ancients the dog's letter. In modern English, there is an increasing tendency to smooth down the roughness of the vibration, until, in such words as *far*, *serf*, *world*, the *r* has dwindled to a kind of nondescript vowel, modifying the preceding vowel. This enunciating process—for such it undoubtedly is—is in so far only the operation of the universal law of phonetic decay, arising from the natural tendency to spend as little energy as possible; but it has been accelerated in this case by a fashion which is apt to mistake languor and indifference for refinement. This affectation goes so far as to turn words like *very*, *rare*, into *veery*, *vaave*. R is one of the most difficult articulations; children are long in learning it, and some individuals never can pronounce it. Whole nations (e.g., the Chinese and some Polynesian tribes) have no such consonant in their language, using *l* instead. The interchanges of *r* with *l* are noticed under L. A more remarkable substitution is that of *r* for *d*, which was very prevalent in early Latin, as we learn from Priscian and from inscriptions. Ex. *arceatos* for *adceatos*. The Latin of the literary period had returned from this corruption, except in *arbiter* (from an old verb, *adbitere*, to go to, to intervene), *arresso*, and *meridies* (for *medidies*, from *medius*). The substitution is easily accounted for, when we consider that in both sounds the tongue is applied to the same part of the palate; only in the one it is applied firmly; in the other, loosely, so as to vibrate.

A very common phenomenon, especially in Latin, is the sinking or degradation of an original *s* between two vowels into *r*. On inscriptions we find *Lases*, *asas*, *esum*, for what at a later period was written *Lares*, *aras*, *eram*. *Jus*, *mos*, became in the genitive *juris*, *mosis*, instead of *jusis*, *mosis*. Even final *s* was sometimes degraded to *r*, as in the double forms, *arbor* = *arbos*, *honor* = *honos*. Curiously, we know the date when the tendency to change *s* between two vowels into *r* set in; for Cicero remarks that L. Papius Crassus, who was consul 535 B.C., was the first that was called Papius, the ancestral name having been Papisius. The interchange in question occurs also to some extent in the Teutonic tongues. Compare Eng. *forlorn* with *lose* (Ger. *verlieren*), *was* with *were*; Ger. *wesen* (to be) with *war* (was); Goth. *hausjan* with Ger. *hören* (to hear); Eng. *hare* with Ger. *hase*. The unstable nature of this articulation is manifested in its frequently

changing its place with regard to an adjoining vowel; compare *board* with *broad*; *bird* with old *brid*; *grass* with A.-S. *gars*.

RA. See EGYPT.

RAAB, a co. in w. Hungary, drained by the Danube and Raab rivers; about 16 0 sq. m.; pop. about 100,000. The surface is level. The principal productions are corn, wine, and live stock. Capital, Raab.

RAAB (Hung. *Győr*), a t. of Hungary, stands on an extensive plain at the confluence of the Raab and the little Danube, a branch of the great river of that name, 67 m. w.n.w. of Buda. It consists of an inner and outer town, is regularly built, and for the most part well paved, but suffers from an insufficient supply of drinking-water. It contains numerous religious edifices, among which is a beautiful cathedral. The manufactures are chiefly tobacco and cutlery; and the trade of the town, favored by its position on the highway between Vienna and Buda, is important both by land and by steamers on the river. Pop. '69, 20,035.

RAALTE, a cantonal t. of the Netherlands, in the province of Overijssel, 11 m. n.e. of Deventer. Pop. '75, 5,512, of whom one-fourth belong to the reformed church, and the remainder, excepting 61 Jews, to the Roman Catholic. The trade is chiefly in agricultural produce, cattle, wool, wood, and bark for tanning. Raalte is one of the prettiest places in the province, having many beautiful houses, and in the neighborhood, seats of the nobility. Hans Willem, baron van Bentinck, the founder of the ducal house of Portland, was b. at Raalte in 1651.

RAASAY, one of the Western isles, belongs to the group of the inner Hebrides, and lies between the isle of Skye and the mainland; the sound of Raasay separating it from the former, and Applecross sound from the latter. It is 13 m. in length by $2\frac{1}{2}$ m. in greatest breadth. Pop., which is gradually decreasing, was, in '71, 389. The western side of the isle is bare and uninteresting. On the eastern and more sheltered side, there are numerous farms, some patches of plantation, and bold and striking scenery. Brochel castle, on the east shore—now a mere ruin—is the chief object of interest in the island. It is perched on the summit of a lofty cliff, which beetles over the sea, and is entirely inaccessible, save by a pathway winding around the cliff.

RABANUS MAGNENTIUS MAURUS, 776–856; b. of French parents in Mentz. Having completed his studies at Fulda in Hesse, he went to Tours and studied under Alcuin, who gave him the surname of Maurus in honor of St. Maurus. In 804 he returned to Fulda, founded the first public convent-school in Germany, and became its head, drawing around him many pupils by his successful teaching; was consecrated abbot in 822, and archbishop of Mentz in 847. He founded the monastery of Mont St. Pierre. He introduced a rule that the clergy should preach only in the native tongue. He required also the study of the Greek of the New Testament. Rabanus wrote commentaries on the whole Bible.

RABAT', or **RABATT**, a seaport and manufacturing t. in the kingdom of Fez, Morocco, stands at the mouth of the Bu-Regreb, 135 m. s.s.w. of the entrance to the strait of Gibraltar. It is surrounded by walls; protected by batteries, and by a citadel, called *El-Mansur*; and contains numerous mosques, minarets, bazaars, etc. Owing to the siting up of the mouth of the river, the commerce of Rabat has much declined. Manufactures, however, of carpets, bournus, woolen fabrics, waterproofs, mixed linen and silk goods, saddlery, etc., are actively carried on. Rabat was formerly the center of the European trade with Morocco, and it still exports olive oil, wool, grain, oranges, hides, flax, and dye-stuffs, wax, etc. There is a small import of cotton-stuffs, linen, cutlery, glass, sugar, and tea. Value of imports '74, £11,000; of exports, £5,400. Pop. 20,000, of whom 2,000 are Jews.

RABBA, a flourishing t. of Africa, in the kingdom of Gando, stands on the left bank of the Niger, 80 m. above Egga, in lat. 9° 16'. The district by which it is surrounded is beautiful and highly cultivated. Rabba carries on an extensive general trade, and is the most notorious slave-market in this part of Africa. Estimated pop., 40,000.

RABBI (Heb., *My master*), an honorary title of the Jewish masters of the law, which is first found applied after the time of Herod, subsequently to the disputes between the two schools of Shammai (q.v.) and Hillel (q.v.). It was in common use at the time of Christ, who is addressed as such by his disciples and the common people. Other forms of the same title are rab, rabban, rabbon ("rabbuni")—the first, like rabbi, being more a general term for a certain recognized authority, the latter applying more strictly to a head of an academy. The title rabban was first given to the grandson of Hillel, Gamaliel (q.v.), and was only borne by seven other exalted chiefs of schools. Properly speaking, the following dignities alone were of old considered "official": 1. *Sopher*, scribe, one who occupied himself with copying and commenting on the Scriptures, and who, when elected to the sanhedrim (q.v.), received the title of chacham (sage); 2. *Rabban*, nomodidaskalos, one who held popular orations, homiletically or otherwise treating of the law. Out of the number of the regular disciples (talmidim) were chosen the chaberim (colleagues), who, again, were elected to the dignity of a rabbi by the "semichah," or imposition of hands by three members of the sanhedrim. At present

nothing but the degree of "inoreni," our teacher, bestowed upon a candidate who proves his erudition in the written and oral law and all its bearings before a college of rabbis, is wanted to render him eligible for the post of a rabbi, which, however, carries no authority whatsoever with it, save on a very few ritual points. We need hardly allude to the popular fallacy of the rabbi of our day being a kind of "priest" in the sense of the Old Testament. He is simply the teacher of the young, delivers sermons, assists at marriages and divorces; and the like, and has to decide on some ritual questions. Up to the times of the removal of the "disabilities" in Europe, he had on some occasions also to give judgment in civil matters, in accordance with the "Choshen Mishpat," a legal text-book, derived from the talmudical and post-talmudical authoritative decisions.

RABBIT, *Lepus cuniculus*, an animal of the same genus with the hare, but of smaller size, and with shorter limbs, the hind-legs shorter in proportion. It is not adapted, like hares, to seek safety by rapid and continuous running, but by retreating to burrows, which it excavates with great dexterity. Except in some varieties, which result from domestication, the ears are only about as long as the head. The wild rabbit is of a grayish-brown color, paler or whitish on the under parts; the ears not tipped with black, like those of the common hare; the tail rather larger and more conspicuous—brown above, white beneath. The rabbit exhibits a remarkable difference from the hare in its gregarious habits; and another in the comparatively imperfect state of the young at their birth, which are blind for some days, and are almost destitute of hair. It delights in sandy heaths, dry grounds covered with scattered furze or juniper, and other such situations; to which, however, it is by no means restricted, and is often very troublesome by its depredations on crops in the finest fields, having its abode in some neighboring wood, but it never makes its burrow in a wet soil. Although now very abundant in most parts of Britain, and generally throughout Europe, the rabbit is said to have been introduced into Britain from Spain, and even to have been originally brought to Europe from the n. of Africa. In a wild state the rabbit is monogamous, and the attachment of a pair is said to continue during life; but in a state of domestication, it ceases to pair. The fertility of rabbits is proverbial; they begin to breed when six months old, and are capable of producing several litters in a year, of 4 to 12 or more in a litter; so that, in favorable circumstances, they multiply with prodigious rapidity; and although they have many natural enemies, would in many places become an intolerable pest to farmers, were not means adopted to reduce their numbers. Rabbits often inflict great injury on plantations by barking young trees, seeming to take pleasure in tearing off far more than they can eat. An infusion of tobacco repels them from trees. The flesh of rabbits is in high esteem, and the fur being used for various purposes, rabbit-warrens are found profitable in lands not suited for agriculture. See RABBIT-SKINS.

Instances have occurred of the rabbit and hare breeding together, but they are very rare, and the creatures seem rather to regard one another with antipathy.

Tame rabbits exhibit great variety of colors—gray, brown, reddish-black, more or less mixed with white, and often white with all the characters of albinism. Peculiarities of other kinds also appear in some of the varieties, among which excessively long and drooping ears are one of the most remarkable. *Fancy rabbits* are prized and tended like *fancy pigeons*. But when rabbits are kept for economical purposes, those which differ less widely from the original type are preferred. Rabbits eat almost any kind of vegetable food; the coarser blades of cabbages, turnip-leaves, celery-tops, carrot-tops, and other produce of the garden, not suitable for human use, are readily consumed by them, as well as chick-weed, sow-thistle, dandelion, and many other weeds. With very little trouble, and still less expense, a man can easily secure one or two rabbits a week for his family from the produce of his stock. When the rabbit-enclosure contains a plot of grass and clover, it affords them an important part of their food. Great care is requisite to keep their boxes dry, neglect of which, and a too exclusive feeding with green and succulent food, cause diseases, often fatal, particularly to the young. Dry food, such as corn, ought to be frequently given; and aromatic herbs—such as parsley, thyme, milfoil, etc.—not only tends to preserve the health of rabbits, but to improve the flavor of their flesh. It is usual to give no water to tame rabbits; but it is better to supply them regularly with it, and the females particularly need it after producing young.

The *Angora rabbit* is a remarkable variety, with very long silky hair, which is easily stripped off in summer, and is of considerable value. The rearing of this kind of rabbit is extensively practiced, in some parts of France, in order to the manufacture of gloves, etc.

An old English name for the rabbit is *cony*, and its name in many other languages is similar to this, as Lat. *cuniculus*, Ital. *coniglio*, Ger. *kunichen*, Welsh *cwningen*; but the rabbit is not the cony (q. v.) of Scripture.

The gray rabbit (*Lepus sylvaticus*) of North America is the most plentiful species of the genus *Lepus* in New Jersey, Pennsylvania, and the more southern states; but although it somewhat resembles the common rabbit in color, and is rather inferior to it in size, its habits are intermediate between those of the rabbit and of the hare. It does not burrow, although, when hard pressed by a pursuer, it retreats into any accessible hole, and sometimes digs, in order to escape from or enter an inclosure.

RABBITS, in point of law, give rise to many nice questions, which in practical life are of no small importance, for they form a branch of the game-laws (q.v.). In England and Ireland, whoever is owner of the soil is entitled to catch and kill all the rabbits he finds upon it, without any game license; but if he is not the owner or tenant of the lands, nor acting by their express direction or permission, then he must have a license. As between landlord and tenant, the rule is, that unless the lease expressly say that the rabbits shall belong to the landlord, they belong to the tenant, who can kill and catch them at discretion. A tenant, however, though having a right to kill rabbits on his farm, cannot give leave to strangers to come on his farm and enjoy a day's sport there, though nothing but rabbits are killed, the privilege of killing the rabbits being personal to the tenant. Nevertheless, the tenant may employ his servant or a rabbit-catcher to kill the rabbits if they exist in excessive quantities, for in that case he deals with them as vermin. Though rabbits are not game, still they are protected against poachers in precisely the same way; for if any one trespass on land to kill rabbits, he is liable to be fined £5; and he may be arrested, if caught in the act on the lands, and detained, provided he do not tell his name and address, and quit the lands. The rabbits which he has poached cannot, however, be taken from him by any person, except, only, when he is on the highway, and then only by a constable, who suspects he has poached them. In the latter case, viz., where the poacher is stopped on the highway by a constable (and he cannot be stopped by any other person there), he cannot be taken into custody, but merely is liable to be summoned before justices, and fined. Poachers who take rabbits in the night-time now commit an indictable offense, and not merely an offense which justices can punish summarily. There is no close-time as to rabbits, and any person may buy and sell them without any license. In Scotland, the law does not materially differ from that of England as to rabbits, and the tenant is entitled to kill them if there is no express reservation of them to the landlord. Poachers of rabbits are punished summarily in the same way, and constables on highways may stop poachers as in England. The only difference between the law of England and Ireland is, that in Ireland a game license is not required in any case for killing rabbits, whether the lands are the sportsman's own lands or not. See also GAME, POACHING. Paterson's *Game-laws of the United Kingdom*.

RABBIT-SKINS have a regular commercial value in consequence of the hair being well adapted for felting purposes; hence they are collected in large numbers by the chifferniers of this and other countries, and the hair itself is not unfrequently imported from Holland and Germany under the erroneous name of "cony-wool." Its chief use is in making the bodies of felt hats; and this is now done by machinery of very ingenious construction. It consists of a hollow cone of copper, of the size of the felt-cones required by the hatters. The cone is covered with perforations, and it fits on to a metal shaft of the diameter of its base by means of a collar, which can be turned round by a band, so as to carry the perforated cone with it. At the bottom of the metal shaft is a fan, moved by machinery, which produces a strong downward draft, so that if the hairs are thrown against the cone, they are held tightly by the current of air through the perforations, and as the cone regularly revolves, its outer surface becomes entirely coated with the rabbit-hair. When a sufficient thickness is obtained, the smooth copper cone is easily drawn out, leaving a cone of wool, which is felted by the usual processes of wetting, beating, etc. Another ingenious contrivance in this machine is to make the draught of air caused by the fan blow the rabbit-fur forward to the cone, so as to distribute it with an evenness which could not otherwise be attained.

The skins, after the hair has been removed from them, are sold to the glue-makers, and are used—mixed with shreds of other skins—in the manufacture of glue and size. Besides these uses, the skins of rabbits are dressed as furs, in various ways, to supply the demand for cheap articles; and so skillfully is this branch of trade carried on, that admirable imitations of the rarer and more costly furs are made. Thus, ermine and miniver are made from white rabbit-skins, the black ones furnishing the spots; and the common variety is dressed and dyed various ways, to represent the furs of dark colored animals. In the reign of Henry VIII. rabbit-fur was valued very highly, and was worn by the nobles of the realm; this is referred to in the charter of the Skinners' company.

There has been a very large market in the United States for the imitation furs prepared from rabbit-skins, to which country British manufacturers have largely exported.

RABELAIS, FRANÇOIS, the greatest of French humorists, was born, according to the general statement of biographers, in 1483, but more probably toward 1495, at Chinon, a small town in Touraine. His father, Thomas Rabelais, was proprietor of a farm in the neighborhood, celebrated for the quality of its wine, the sale of which he, perhaps, combined with the business of an apothecary. His prosperous circumstances enabled him to give to his son every advantage of education, and at an early age the boy was sent as a pupil to the neighboring abbey of Seully. His progress in his studies being found by no means satisfactory, he was thence removed to the university of Angers. Here—though as a scholar he still remained quite undistinguished—he was fortunate enough to make the acquaintance of Jean (afterward the celebrated cardinal) Du Bellay, to whose steady and helpful friendship he was subsequently much indebted. At the desire of his father he consented to embrace the monastic state, and, after passing

through the preliminary novitiate, became a brother of the order of St. Francis, in the convent of Fontenay le Comte, according to the annalist, Pierre de St. Romuald, in 1511, but the discovery of a document by M. B. Fillon (*Poitou et Vendée*, Fontenay, 1861), renders the date 1519 more probable. Rabelais now devoted himself with the utmost ardor and perseverance to the prosecution of his hitherto neglected studies. Aiming at the widest culture attainable, he ranged the whole circle of the sciences as then understood. To medicine, in particular, he seems to have been strongly attracted; and in the sphere of language, in addition to Latin and Greek, he is said to have attained a competent mastery of Italian, Spanish, German, English, Hebrew, and Arabic. Meantime, with his brother-monks, he was much the reverse of a favorite. They hated him for his devotion to the new learning, and suspected his Greek to be only a cover for heresy. About 1523 a search was made in his cell for suspicious books; the whole were confiscated, and to save himself from further and sharper persecution he fled. But though only a poor monk, the wit and learning of Rabelais had gained him several influential friends, through whose exertions he obtained from pope Clement VII. an indulgence to transfer himself from the order of St. Francis to that of St. Benedict, and became an inmate of the monastery of Maillezais. For the calumny afterward circulated, that his removal was necessitated by the odium attached to a life of profligate indulgence, there seems no reason to suppose that there ever was the smallest ground. We must infer that in his new abode he found himself not much more comfortable than before, as after a few years he quitted it abruptly, without the sanction of his ecclesiastical superiors, thereby incurring the severest censures of the church. But it was not persecution that induced this second flight from the monastic state. It was the incurable aversion of the grotesque humorist to the restraints of the "regular" clergy. And nobody seems to have really blamed him for his professional apostasy—his own bishop, among others, receiving him at his table in the most friendly manner! During 1524-30 he appears to have frequented the universities of Paris and Bourg, which may account for the intimate knowledge of university manners and opinions shown in his great work. In the year 1530 he settled himself at Montpellier, and, taking a medical degree at the university, was appointed to the post of lecturer. In 1532 he went as hospital physician to Lyons, where he published several works on medical science, besides other miscellaneous matter bearing on archæology, jurisprudence, etc. In the beginning of 1534, his old friend, Jean Du Bellay, then bishop of Paris, and shortly after to be cardinal, passed through Lyons on an embassy to Rome, whither, in the capacity of traveling physician, Rabelais was delighted to accompany him, in fulfillment of a desire long cherished. While at Rome he petitioned Paul III. for a remission of the penalties still attached to his misdemeanor before mentioned; and through the interest of Du Bellay and others, a bull was obtained, absolving him and permitting his return to the order of St. Benedict. But he continued the exercise of his profession of medicine at Montpellier and other towns till 1538, when he withdrew as canon into Du Bellay's own abbey of St. Maur des Fosses, near Paris, and resumed his monastic habit. The death of Francis I., in 1547, was followed by the fall of cardinal Du Bellay, the new monarch, Henry II., favoring the cardinal de Lorraine. Rabelais shared for a time in the disgrace of his old protector, whom he appears to have followed to Rome, but his tact and irresistible humor won him friends among the Lorraines, and in 1551 he obtained the curacy of Mendon, in the occupancy of which the remainder of his life was passed. So far as record remains of it, his life here was happy and blameless. He was exemplary in the fulfillment of duty, profuse of charity, sedulous in the relief of suffering, for which his medical knowledge afforded him unusual facilities, and always specially delighted to cultivate, as occasion served, the society of those any way noted as eminent in learning or science. He died at Paris, in 1553, in the Rue des Jardins, in the parish of St. Paul, in the cemetery of which he was buried.

The scientific treatises of Rabelais are—almost in the nature of the case—long since utterly forgotten; but his romance, in which are narrated the wonderful adventures of Gargantua and Pantagruel, continues to take rank as one of the world's masterpieces of humor and grotesque invention. In the form of a sportive and extravagant fiction, it is, in fact, a satirical criticism of the corrupt society of the period, the prevalent follies and vices of which are parodied with surprising effect and ingenuity. The difficulty of its allegorical form, however, and the quantity of recondite allusion it embodies, tend somewhat to impair the effect of the work for most modern readers. Also, it must be said, that in his attempt to

Cleanse the foul body of the infected world,

it is the whim of the writer to infect himself with not a little of its foulness; and such is the riotous license of the buffoonery, from behind which, as a stalking-horse, he shoots the arrows of wit, that few books are less fitted for general perusal in the present more decorous times. On the publication of his work, the charge of irreligion and atheism was freely preferred against Rabelais, and certain other scandals were circulated, for which there seems to have been in his life no foundation, except as the free tone assumed by the writer might suggest a precarious inference to defective morality in the man. The religious corruptions of the time, and the vices of the priestly class, had formed one favorite theme of his satire, and he simply paid the usual penalty in thus incurring

the easy retort calumnious. See Delécluze, *François Rabelais* (Par. 1841), and P. Lacroix, *Rabelais sa Vie et ses Ouvrages* (Par. 1859), in the latter of which works the incidents of his career are for the first time clearly and correctly narrated.

RABIES, the name given to a disease affecting the dog and other animals, was known to the ancients, and is spoken of by Aristotle, Pliny, and Horace; but it does not seem to have been then so virulent in its nature, or alarming in its consequences, and Aristotle, perhaps in ignorance, states that man was not subject to its attacks. It was very prevalent on the continent two or three centuries ago, but was comparatively rare in this country until the last century. This malady stands almost alone in this, that all animals seem liable to its attacks.

It is a matter of dispute among some of our best authorities whether rabies be occasionally *spontaneous* in the carnivora—the only animals in which it is undoubtedly inherent—or communicated solely by *inoculation*.

Looking simply at the *history* of the disease, the facts would seem to be against the spontaneity theory. Rabies is not known in some countries, such as the cape of Good Hope, s. Africa, Egypt, Syria, the South Sea islands, Lisbon, where dogs swarm; and in Constantinople, where they go at large, and support themselves on offals of all kinds and qualities, the disease is of very rare occurrence. John Hunter relates that it was not known in Jamaica for 40 years previous to 1783, when it was introduced by an affected dog from America; and Dr. Hamilton says that curs of the most wretched description abound in the island of Madeira—that they are affected with almost every disease, tormented by flies, by heat, thirst, and famine, yet no rabid dog was ever seen there. There is often, no doubt, great difficulty in tracing the cause of rabies from inoculation. The owner may feel convinced that his diseased dog had almost never been out of his sight, or exposed to an affected animal; but when we consider the predatory habits of the dog, and his love of association, and how easily he can steal away unobserved by night or by day for a longer or shorter time, we can readily account for the most vigilant eye being occasionally off its guard. It has been asked, as an objection to the exclusiveness of contagion or inoculation, How was rabies at first originated? But the same difficulty attends the case of small-pox and other diseases which now arise only from contagion.

There is another important peculiarity in this disease on which medical men are divided—viz., whether the virus of a rabid animal, other than of the *carnivorous* species, can communicate the disease. Experiments to test this were made by some foreign surgeons of eminence, by Drs. Vaughan and Babington of London, and at the Royal Veterinary college; and it is reported that in every instance they failed in producing the disease. It is certain, however, that others have not so failed in their object. MM. Majendie and Brechet in 1823 inoculated two dogs with the saliva of a hydrophobic man, and it resulted in one of the dogs becoming rabid, which in turn communicated the disease to other dogs and some sheep. Mr. Earl, the well-known London surgeon, in administering medicine to a hydrophobic woman, was bitten by her, and he immediately excised the bitten part. Being accused of unnecessary fear and cowardice, he determined to justify his fears, and having inoculated rabbits with the woman's saliva, some of them became rabid. Mr. King of Bath succeeded in producing the disease in a common hen by the virus of a cow. Several other cases could be related, but it may serve our purpose to quote the following remarks of Mr. Youatt: "I can imagine that the disease shall not be readily communicated by the saliva of a graminivorous animal; but I have once produced it in the dog with the saliva of an ox, and twice with that of the horse, but I have failed to do it in very many cases. While on this point, it may be remarked, that the writer once saw a rabid horse bite a young man's hand rather severely, while incautiously giving it a ball of medicine, and he accompanied him to sir Astley Cooper, who, according to his invariable practice, as he told us, applied nitrous acid to the injured part, and he assured us that no bad effects would accrue; and neither there did."

We shall briefly notice some of the leading *symptoms* of rabies in the dog and horse. These may be exhibited in the dog in a few days, or it may be, and often is, weeks, and even months after he has been bitten. At first he loses his appetite, becomes sullen, fidgety, has a vacant gaze, licks or gnaws the injured part, laps any liquid that comes in his way—for he has, unlike man, no dislike for water, although he has a difficulty in swallowing it—eats wood, straw, hair, and other indigestible substances; and in a day or two he becomes quarrelsome, bent on mischief, bites at anything that comes in his way, and his bark is more like a howl; his lower jaw often becomes pendulous, and general paralysis sometimes precedes death; and as a rule, on the fifth or sixth day he dies. The principal post-mortem appearances are these—enlargement and increased vascularity of the salivary glands, inflamed condition of the base of the tongue and fauces, epiglottitis, and stomach, which last organ almost invariably contains such indigestible substances as straw, hair, offal, etc. The symptoms in the horse, which become apparent in a few weeks, are those of extreme irritability. He trembles, heaves, and paws, staggers and falls; and after a severe struggle, he suddenly rises again, and appears settled and collected, when he will again exhibit the usual distressing symptoms. He is sometimes mischievous, bites, foams, and snorts; and generally in three days he dies paralyzed and exhausted.

The disease seems primarily to be one of *blood-poisoning*, and not, as some have represented it, an affection of the nervous system. We know that some instances of blood-poisoning terminate with coma, or convulsions, but are not, on that account, to be considered as proceeding from nervous disease. Whatever may be the precise nature of the disease, it is certain that no cure has been discovered for it. The writer has seen many dogs, some horses, and an ox in all the different stages of it, and many attempts at a cure tried, without producing even any palliative effects, and every one of the patients died in the ordinary course, whether anything or nothing was done. As the disease is so rare, and—contrary to popular belief—is not more prevalent at one period of the year than another, no anticipatory precautionary measures can be taken. Preventive measures, however, when it is known, or even suspected, that the disease has manifested itself, should not for an instant be neglected. All dogs known to have been bitten, or been in the company of the rabid animal, should be immediately destroyed, and every other dog in the town and district confined, or closely muzzled, for several weeks, or even months. As to the measures to be taken when a human being is bitten by a rabid animal, see *HYDROPHOBIA*.

RABINET, a small piece of ordnance formerly in use. It weighed but 300 lbs., and fired a small ball of 1½ in. diameter, with a very limited range.

RABUN, a co. in extreme n.e. Georgia, drained by the Chattooga and Little Tennessee rivers and Tallulah creek; 500 sq. m.; pop. '80, 4,634—4,629 of American birth, 195 colored. The surface is rugged and mountainous; in the s. part are the Tallulah falls, of great beauty, situated in a wild gorge. Corn and pork are the only products. The county is noted as the home of many illicit distillers. Co. seat, Clayton.

RACAHOUT, a farinaceous food imported from the Barbary coast, and sometimes recommended, but with questionable judiciousness, to invalids. It is believed to consist of the meal of the acorns of the Barbary oak (*quercus ballota*), flavored with some aromatic herb. It is sometimes sold under its French designation of *racahout des Arabes*. It must not be confounded with *tacahout* (q.v.).

RACALMU TO, or **RAGALMUTO**, a t. of Sicily, in the province of Girgenti, in an inland situation, on the crest of a hill 12 m. n.e. from Girgenti. It is said to be of Saracenic origin. It has a castle built by Frederick Chiaramonte in the 14th century. Pop. '71, 11,012.

RACCONI'GI, a t. in the w. of northern Italy, pleasantly situated on the Maira, 24 m. s. of Turin by railway. Its palace, surrounded by a small but handsomely laid-out park, is one of the country residences of the royal family. Silk fabrics and twist, and woolen cloths, are manufactured. Pop. 8,211.

RACCOON', or **RACCOON**, *Procyon*, a genus of quadrupeds of the bear family, *ursidar*, but differing widely from the typical members of that family, in being less perfectly plantigrade, the whole sole of the foot being indeed rested on the ground when the animal is still, but being partly raised when it walks, while when running it only touches the ground with the tips of its toes, and moves in a bounding manner. The dentition also differs from that of bears, there being, for one thing, only six instead of seven molars on each side in the lower jaw. The dentition indicates an aptitude both for animal and vegetable food. The general appearance may be described as intermediate between that of a fox and of a bear in miniature. The raccoons are exclusively American. The common raccoon (*P. lotor*) is a native of North America, from Canada to the s. of Mexico. It is about the size of a small fox, grayish-brown; the muzzle white. The hair is of two kinds, an under coat soft and woolly, of a uniform gray; and long and rather stiff hairs projecting through the wool, and alternately marked with black and grayish-white. The raccoon frequents the sea-shore, and the margin of swamps and rivers. It commits great ravages on fields of Indian corn, plantations of sugar-cane, etc., and is not less destructive to poultry. It feeds much on oysters, particularly in the alluvial coast-lands of Carolina and neighboring regions where the American oyster abounds on the banks of rivers and creeks, and exhibits great dexterity in opening oysters. It is also very fond of crabs and other crustaceans. It has a curious habit of dipping or washing its food in water, whence its specific name *lotor* (Lat. washer). When pursued, it often takes refuge in a tree, climbing with great agility, but its destruction is then considered sure, whence the American proverbial reference to a *tree'd 'coon*. The fur of the raccoon is used in the manufacture of hats, and is a considerable article of commerce.—Another species, the **CRAB-EATING RACCOON** (*P. cancrivorus*), the crab-dog of Guiana, is found in all parts of South America e. of the Andes. It is rather larger than the common raccoon, although very similar to it.—Both species of raccoon display the same love of glittering things which is so remarkable in magpies, jackdaws, and others of the crow family. Mr. Wood mentions in his *Natural History* that a common raccoon did its best to get a ring off his finger by hitching one of its crooked claws into the ring, and pulling with all its strength; and a gentleman once resident in Guiana informed the writer of this article that a crab-eating raccoon, which he caught young, and completely tamed, showed such a propensity to steal silver spoons that he was obliged to send it away into the woods.

RACE, a term employed in some cases, particularly in the English channel, to designate the powerful current formed by a rushing tide. Thus, between the island of Alderney and cape La Hogue, on the coast of France, is the *Race of Alderney*; and off the isle of Portland, on the coast of Dorsetshire, England, is the *Race of Portland*.

RACE. "A *race* is a class of individuals concerning which there are doubts as to whether they constitute a separate species, or a variety of a recognized one. Hence the term is *subjective*; i. e., it applies to the *opinion of the investigator* rather than to the *object of the investigation*; so that its power is that of the symbol for an unknown quantity in algebra. The present writer having as yet found no tribe or family for which a sufficient reason for raising it to a new species has been adduced, has either not used the word *race* at all, or used it inadvertently. Its proper place is in *investigation*, not in *exposition*."—Latham, *Natural History of the Varieties of Man*.

RACE, the portion of a loom from which the shuttle is projected through the shed, or separated threads of the warp.

RACE-HORSE, a breed of horses distinguished for extreme fleetness. It owes its origin in great measure to Arabian, Barbary, and Turkish horses introduced into England. The great interest taken in horse-racing (q. v.) since the time of James I., has led to the greatest care of the animals employed in it, and the utmost improvement of the breed. The race-horse is generally longer-bodied than the hunter, and the same power of leaping is not required. See HORSE-RACING.

RACEME' (Lat. *racemus*, a bunch of grapes), in botany, a form of inflorescence (q. v.) which is *centripetal* (see CENTRIFUGAL and CENTRIPETAL), and in which the flower-stalk throws off branchlets (*pedicels*) of nearly equal length, and each bearing a single flower. Familiar and very perfect examples of the raceme may be seen in the red or white currant and in the barberry. Notwithstanding the origin of the name, a bunch of grapes is not a true raceme, but a panicle (q. v.).

RACEMIC ACID. See TARTARIC ACID.

RACHEL, ELISA (properly ELISA RACHEL FELIX), a celebrated French *tragedienne*, was b. at Munf, in Switzerland, of poor Jewish parents, on Feb. 28, 1820. The family removed to Lyons, in France; and in order to aid in its support, the child Rachel and her sister Sarah were in the habit of singing for chance gratuities in the streets and cafés of the place. In 1831 the household was transferred to Paris, and for Rachel, lessons were procured in singing from an eminent teacher of the day. In music, she gave no promise of special excellence; and in 1833 she made her first appearance on the stage as an actress. Though her talent had previously been discerned by certain of the more judicious (among others, Jules Janin and the celebrated Mlle. Mars), it was only in 1838 that in the character of "Canille," in Corneille's tragedy of *Les Horaces*, she first strongly attracted the attention of the public. The admiration excited by her performance rapidly grew into enthusiasm; and from this time forward, in the great parts supplied by the classic masterpieces of Corneille, Racine, and Voltaire, she shone without a rival. In 1843 her fame may be said to have culminated in her appearance as "Phèdre" in the tragedy of that name by Racine. In *Adrienne Lecourreur*, a piece expressly written for her by MM. Legouvé and Scribe, she had also immense success, though in other more modern parts, her popularity was somewhat less. The *furor* excited in Paris in 1848 by her public recitation of the *Marseillaise Hymn*, in the interest of the revolutionary government, will continue to connect her name with the public history of the period. In 1849 she made the tour of the French provinces, and subsequently visited England and Russia, everywhere meeting with success and enthusiastic recognition. Her health, however, had begun to fail: in 1855, in the course of a professional visit to America, it altogether gave way, and she returned utterly prostrated. A residence at Cairo failed to restore her to strength; and on Jan. 3, 1858, she died at Cannet, near Toulon. As an artist, within the limits prescribed by her genius, she had probably never been quite equalled. Of the burning intensity which characterized her rendering of passion in its fiercer concentrations, no words can give an adequate image. "She does not act—she suffers," some one very well said of her. Her "Phèdre"—by common consent her masterpiece—was an apocalypse of human agony, not to be forgotten by any one who ever witnessed it. In character, Rachel was neither exemplary nor amiable. Of the details of her private life, it is as well that nothing should be said. In her professional relations, she was notoriously grasping and avaricious. Her immense popularity enabled her, during much of her career, pretty much to dictate her own terms to managers, and of this power, she is said to have availed herself without scruple or generosity. In this way she very rapidly amassed a large fortune. If little else of good is on record of her, she was constant in her home affections, and throughout she frankly made her whole family sharers of her prosperity.

RACHIS (Gr. the back-bone), in botany, the *primary floral axis*, an elongation of the stem or of a branch, from which arise the flower-stalks (peduncles), or to which the flowers are immediately affixed.

RACINE, a co. in s. e. Wisconsin, drained by Fox and Root rivers, and bounded by lake Michigan on the e.; traversed by the Chicago and Northwestern and the Western

Union railroads; 340 sq. m.; pop. '80, 30,921—20,313 of American birth. Surface level and fertile; wheat, oats, corn, hay, and cattle are the staples. Co. seat, Racine.

RACINE, a city of Wisconsin, situated on lake Michigan, at the mouth of Root river, which forms an excellent harbor, and on the line of the Chicago and Milwaukee railway, 23 m. s. of Milwaukee. It has ship-yards, factories, furnaces, etc. Pop. '60, 7,822; '70, 9,880; '75, 13,282.

RACINE (*ante*), pleasantly situated on land elevated about 40 ft. from the level of the lake, and projecting several m. beyond the shore line; pop. '80, 16,031. It is a station on the Milwaukee division of the Chicago and Northwestern, and on the Western Union railroads. The town, incorporated in 1848, is inferior in size to Milwaukee only. The city is pleasantly laid out and has many fine residences. On the chief street (Main st.) is Racine college, an Episcopal institution, established in 1852, in which are about 20 instructors and 200 students. The lake commerce of the city is considerable, but manufactures are the chief source of wealth. The number of factories is large; among the articles produced are boots and shoes, wagons, threshing-machines, and other agricultural implements, silverware, and trunks. There are 4 papers, 2 banks, a Roman Catholic academy, and public schools, an orphan asylum, hospital, and 24 churches.

RACINE, JEAN, the most admired of all the French dramatists, was b. at Ferté-Milon, Dec. 21, 1639, of a respectable family belonging to the *bourgeoisie*. At the age of four he lost both his parents, and then went to live with his maternal grandfather, by whom he was sent to the college of Beauvais. Here he remained till he was 16, at which time his grandfather died. He was then taken to Port Royal (q. v.), where his grandmother and his aunt Agnes were leading a recluse life, and placed at the school which had been opened in that celebrated retreat by the pious scholars assembled there. Racine astonished his teachers by the rapidity of his progress in all his studies, especially in Greek; but he won their regards still more by the affectionate seriousness of his character, which gave a delicacy to his ardent sensibilities and vivid imagination. They loved him, yet they trembled for him. When they saw him wander—Sophocles or Euripides in his hand—among the shadows of the abbey, anxiety took possession of their hearts; and when they learned that he secretly indulged in the sinful pastime of making verses, they even thought it necessary to punish their favorite. Their punishment was indeed an odd one, for they obliged him to turn the hymns of the Roman breviary into French verse! Novels were placed under the same ban as poetry. One day the sacristan Lancelot found him reading the Byzantine romance of bishop Heliodorus (q. v.), entitled *The Loves of Theagenes and Charicleia*, and threw the book in the fire; but Racine says that it was already fixed in his memory, and that he smiled at this futile attempt to rob him of it. We can easily see that Racine was not at all ascetically disposed as yet. After a residence of three years at Port Royal, during which time he had, among other things, read and annotated the best Greek and Latin classics, he went to the collège d'Harcourt to finish his curriculum with the study of logic. Then he went out to "see life," got into loose company, became irregular himself, and even grew so reckless as to burlesque, in his correspondence, the pious phraseology in vogue at Port Royal. Deep was the grief and incessant were the remonstrances of his old friends, but they were long without avail. He had made some little name as a poet by an ode on the marriage of the king, and had had the good fortune to get a pension for it, but still his income was small and precarious; and when a maternal uncle, who was a canon-regular of the church of St. Genevieve at Uzès, in Languedoc, held out to him the hope of a benefice, Racine went to live with him in 1661, and tried to study systematic theology. But the effort was a hopeless one. While he gazed vacantly into the *Summa* of St. Thomas, his thoughts were with Ariosto and Sophocles. In the summer of 1662 he returned to Paris in disgust, and commenced life as a dramatic writer, having meanwhile made the acquaintance of Molière and Boileau. His first piece was the *Frères Ennemis*, played in 1664; but it was not till 1667, when his *Andromaque* appeared, that the power and peculiar character of his genius excited marked attention. For the next ten years his career as a dramatist was unsurpassably brilliant, yet, strange to say, we know almost nothing of his private or social life during that time. We have to content ourselves with little more than a few meager facts relative to his literary performances, the chief of which are *Britannicus*, *Berenice*, *Bajazet*, *Mithridate*, *Iphigénie*, and *Phèdre*. Suddenly, at the early age of 38, in the full sunshine of his fame and vigor of his power, he resolved to abandon both the stage and the world, and become a Carthusian monk. The effect of his Port-Royal training was now seen. In the midst of all his literary ambitions and strifes, his little excesses, irregularities, and amours, Racine had carried with him a keen and faithful conscience; and partly from disappointment, partly from remorse, he longed to forget all in acts of devotion. With difficulty he was prevailed upon to modify the rigor of his purpose, and instead of seeking for religious felicity through the privations of solitude, and the severities of penance, to do so through marriage with some pious woman, and the cultivation of domestic virtues. A suitable lady—very devout, but not very intelligent—was found for the poet in the daughter of the city-treasurer of Amiens, and the marriage took place in 1677. Seven children, two sons and five daughters, were the fruit of this union. Shortly after it, Racine was appointed historiographer to the king. Henceforth his course of life was pursued with the utmost regularity—one-

third of the day being given to God, another to his family and friends, and the remainder to the king. His *Esther* (1690) and *Athalie* (1691) are the only dramas which he produced after his conversion, and they are profoundly imbued with religious feeling. *Athalie* is reckoned by some his finest effort, and certainly the only one which can at all be placed in comparison with it is the *Phèdre*. The poet died, after a brief illness, on April 21, 1699.

Racine's dramatic genius was essentially French, or pseudo-classical, and therefore it is not easy for Englishmen trained to appreciate the power, magnificence, and variety of the Shakespearian tragedy, to sympathize with it or to criticise it impartially. In the eyes of his countrymen, he is the most perfect, if not the most sublime, of all their dramatists. Corneille may at times exhibit a grander and more rugged energy, but in beauty, grace, and a certain tender majesty of style, Racine is held to be without a rival; and it must be remembered that *style*, and not portraiture of human character, is the thing in which French dramatists aim to shine. The declamations in which the heroes and heroines of Racine indulge are marvelously fine pieces of rhetoric; but, compared with the Elizabethan drama, they are deficient in deep insight into human nature and in genuine passion, while humor is altogether excluded. See *Mémoires* of Racine, edited by his son Louis. The editions of his works are innumerable, and some are of great splendor; that of Girodet (Paris, 3 vols. 1801-05) being reckoned one of the finest specimens of typography in the world.

RACK (Sax. *urocan*, Ger. *recken*, to stretch), an instrument of torture, used for extracting confessions from criminals and suspected persons. It consisted of a large oblong frame of wood, with four beams a little raised from the ground, on which the sufferer was stretched and bound. Cords were attached to his extremities, and gradually strained by means of a lever and pulleys, till the operation, if persisted in, caused dislocation of the limbs. The rack was known in the 1st and 2d centuries in the s. of Europe, and applied to the early Christians. It was in use in England in the 15th and 16th centuries. According to Coke, it was first introduced into the tower by the duke of Exeter, constable of the tower, in 1447, whence it came to be called the "duke of Exeter's daughter." It is mentioned by Holinshed in 1467; but its use first became common in the time of Henry VIII. as an implement of torture for prisoners confined in the Tower. The infliction of the punishment of the rack took place during the reign of the Tudor sovereigns by warrant of council, or under the sign-manual. In 1628, however, on the murder by Felton of the duke of Buckingham, it being proposed in the privy-council to put the assassin to the rack, in order that he might discover his accomplices, the judges resisted the proceeding, as contrary to the law of England. In various countries of Europe the rack has been much used both by the civil authorities in cases of traitors and conspirators, and by members of the inquisition to extort a recantation of heresy. It is no longer in use in any part of Europe.

RACK, or **RACK-WORK**, is a straight bar, with cogs or teeth placed along it, so as to correspond with similar cogs or teeth placed on a wheel, thus: If the bar is not movable, the wheel is attached to a traversing frame, and as it revolves, is moved along by the resistance of its teeth to those on the bar. It was in this way that the formation of a railway was first projected, the rail and the driving-wheel of the engine to be both furnished with corresponding teeth. In mechanics, rack-work has innumerable applications.

RACKETTS (Fr. *raquette*), a game frequently played in England; it is merely a modern variety of the old game of tennis (q. v.).

RACK-RENT is the full yearly value of lands let upon lease, or to an occupier, or held by a tenant for life, as distinguished from the value fixed by the lease or agreement between the parties, and which is often less or greater than the real value.

RACONDA, or **NUTRIA**, the fur of the coypu (q. v.).

RACZ, or **O BECZE**, a t. of Hungary, in the Servian Wojwodschafft, on the right bank of the Theiss, 26 m. n. e. of Peterwardein. It carries on an extensive trade in corn. Pop. 11,000.

RADACK AND **RALICK**, two parallel chains of islands in the group called Marshall's islands. See **POLYNESIA**.

RADCLIFFE, ANN, the most popular English novelist at the close of the last century, was b. in London, July 9, 1764. She was of respectable parents named Ward. In her 23d year she married Mr. William Radcliffe, a student of law, but who became proprietor and editor of a weekly newspaper, the *English Chronicle*. Mrs. Radcliffe lived much in retirement, known only to a few friends, by whom she was warmly esteemed. Her works are—*The Castles of Athlin and Dunbayne* (1789); *A Sicilian Romance* (1790); *The Romance of the Forest* (1791); *The Mysteries of Udolpho* (1794); *A Journey through Holland*, etc. (1794); and *The Italian* (1797). Mrs. Radcliffe's popularity was constantly increasing down to the date of her latest work, when, in her 33d year, "like an actress in full possession of her applauded powers," as Scott has remarked, "she chose to retreat from the stage in the full blaze of her fame." She lived 26 years afterward, dying in 1823. For the copyright of her *Mysteries of Udolpho*, her best work, she received £500; and for that

of *The Italian*, £800. These sums were at the time considered excessive, and were perhaps the largest ever given in this country for works of fiction until the great era of the Waverley novels. A sixth romance, entitled *Gaston de Blonderville*, and a collection of *Poems* by Mrs. Radcliffe, were published after her death.

As a novelist, Mrs. Radcliffe is pre-eminent for vivid poetical imagination, and for great power of romantic narrative and description. Her paintings of external nature, and of scenes of feudal pomp, gloom, terror, or mystery, are quite unrivaled in modern romance. In the art of awakening curiosity and enchaining attention, she is no less skillful. She keeps her readers in a state of breathless awe and suspense; but in the end, when she resolves all the seemingly supernatural agencies and horrors of her tales into simple natural causes, she unquestionably fails, for her explanations are inadequate to account for the effects produced. She has also little variety of character or striking individual portraits, and no wit or humor. Hence her works, with all their gorgeous pictures and potent spells, seldom interest beyond the period of youth.

RADCLIFFE, Dr. JOHN, a celebrated physician, and the founder of the Radcliffe library at Oxford, was born at Wakefield in Yorkshire, in the year 1650. He was instructed in Greek and Latin at the grammar-school of his native town; and at the early age of 15 he was sent to University college, Oxford. In 1672 he took his degree of M.A., applied himself to the study of medicine, and having taken his degree of M.B. in 1675, began to practice as a licentiate at Oxford. He immediately made himself conspicuous by the originality of some of his ideas, treating the cases in which he was engaged with a total disregard of the usually received rules of the profession, and even holding up these to censure and ridicule. At the very commencement of his practice he made some remarkable cures; and in less than two years was on the high road to celebrity. In 1682 he took the degree of M.D., and remained still two years longer at Oxford in the practice of a lucrative profession.

In 1684 Dr. Radcliffe removed to London. He established himself in Bow street, Covent garden, where, in less than a year, he became the most popular physician of his time. It is said that his conversational powers, ready wit, and pleasantry contributed to this result, quite as much as his professional skill. In 1686 the princess Anne of Denmark, made him her physician. After the revolution, he was sent for by king William, who frequently had recourse to his advice, and the example of the sovereign was followed by most of the nobility and influential persons about the court. Dr. Radcliffe, however, was himself no courtier; he had no occasion to become one. Dr. Mead, who knew him well, pronounced of him, that he was "deservedly at the head of his profession, on account of his great medical penetration and experience." Blunt and independent in his manners—some indeed say even *brutal*, people nevertheless recognized under his rough exterior that quick perception and keen observation of symptoms which are so important in a master of the healing art; and thus his advice was asked by persons of all ranks, in return for which he received fees of an unprecedented amount.

In 1694 he was called upon to attend queen Mary, when attacked by the small-pox. It proved to be her last illness, as Dr. Radcliffe predicted, even before seeing her—merely upon reading the prescriptions of the other physicians in attendance before he was sent for. He did what he could, however, to save her, but in vain; and some attributed her death either to his want of skill or negligence. About this time he offended the princess Anne, who, having sent for him on some occasion to St. James's, had the mortification to hear that he swore all her royal highness's ailments were nothing else than "the vapors." This, combined with her knowledge of Dr. Radcliffe's too great fondness for the bottle, made her appoint Dr. Gibbons as her physician in his place. Still, the king continued to employ him. On one occasion, he sent for him to the Netherlands to attend upon his favorite, the earl of Albemarle, for which he received £1200 from the king, and £400 from the patient himself, besides a diamond ring. To the king himself he frequently spoke with much honesty and plainness concerning his ailments; once, however, he took too great a liberty, for upon his majesty showing him his swollen ankles, and asking him what he thought of them, Dr. Radcliffe replied, "Why, truly, I would not have your majesty's two legs for your three kingdoms." This was toward the end of 1699. He was not again consulted by that sovereign, who soon afterward died; nor was he ever again completely reinstated in the good graces of queen Anne, although she occasionally consulted him, and rewarded him handsomely for his services.

In 1713 he was elected M.P. for Buckingham. He had a country-house at Carshalton, to which he used occasionally to retire; and here he was living in 1714, when queen Anne was attacked with what proved to be her last illness. Dr. Radcliffe was summoned to attend her, but he either would not or could not come. He had taken physic, he said, and it was impossible for him to attend. The queen died in August; and the populace were so enraged against Dr. Radcliffe that he dared not again show his face in London. This much chagrined him, as it kept him a prisoner in a country village. His own end, however, was fast approaching. He must have been really ill when sent for to the queen, as he himself survived her for only two or three months. Dr. Radcliffe died of gout at Carshalton on Nov. 1, 1714, and was buried at Oxford in St. Mary's church with much ceremony. He died possessed of considerable property, the

whole of which he bequeathed to public uses. Thus, to University college he left his estate in Yorkshire, in trust, for the endowment of two traveling fellowships, and the purchase of perpetual advowsons, together with £5,000 for the enlargement of the college buildings. He left £40,000 for the erection of a public library in Oxford, since known as the Radcliffe library (q. v.), which he endowed with £150 per annum for a librarian, and £100 per annum for the purchase of books. To St. Bartholomew's hospital, London, he bequeathed the yearly sum of £500 toward mending the diet, and £100 per annum for the purchase of linen. The rest of his property he gave to his executors in trust for such charitable purposes as they might best approve. The Radcliffe infirmary and Radcliffe observatory, at Oxford, were both erected out of this fund; and from the same source, in 1823, the Radcliffe trustees contributed the sum of £2,000 toward the erection of the college of physicians in Pall Mall.

RADCLIFFE LIBRARY, Oxford. This institution, founded by Dr. John Radcliffe (q. v.), stands in the central area of Radcliffe square. The building is in the form of a rotunda, standing upon arcades, from the center of which rises a spacious and well-proportioned dome. This dome is 84 ft. in height from the pavement, and is beautifully wrought in stucco. The architect was James Gibbs, who commenced the building in 1737, and completed it in 1747. The library is approached by a handsome stone staircase, and over the entrance-door hangs the portrait of the founder by sir G. Kneller. The books composing the library are for the most part works on natural history, physical science, and medicine. Besides these, Gibbs, the architect, bequeathed to it a collection of works, chiefly architectural: Wise, the first librarian, a collection of coins; Kennicott, a theological collection; Frewen, a miscellaneous library; Viuer, some law-books; while from the Frazer and Sale collections the trustees purchased 355 oriental MSS. in the years 1758 and 1760. In 1856 the number of volumes comprising the scientific and medical collection was estimated by Dr. Acland, the librarian, as not less than 14,000, and not more than 15,000. From the year 1834 to the year 1840, the trustees expended £500 annually on the purchase of books. The grant, however, was reduced to £200 in 1841, and continued at that low figure until 1863, when it was again raised to the sum of £500. In 1861, by an agreement between the Radcliffe trustees and the university, the scientific books of the Radcliffe library were removed to the university museum, then recently erected, for public use under prescribed regulations, and the spacious room in the Radcliffe library was opened as a reading-room in connection with the Bodleian library. This reading-room is now open daily until 10 o'clock at night, to the great comfort and convenience of numerous readers.

RADEGUNDA, SAINT, daughter of Berthar, a prince of Thuringia, in the earlier part of the 6th century. Having been carried as a prisoner to France in the twelfth year of her age by Clotaire, at that time king of the district whose capital is now called Soissons, she was educated in the Christian religion, and when she reached a mature age, was induced, very reluctantly, to become the wife of Clotaire. Her own wish having been to become a nun, her married life was in great measure given up to works of charity and religion, and Clotaire complained that he "had married a nun rather than a queen." Eventually, about the year 553, she obtained his leave to retire to a monastery at Noyon, where she was consecrated a deaconess by the bishop Medard. Soon afterward she founded a monastery at Poitiers, in which she lived as a simple sister, but which she endowed richly, not only with money and lands, but also with relics and other sacred objects obtained from the Holy Land and all the more eminent churches of the e. and west. It was on the occasion of the translation to her church at Poitiers of a relic of the holy cross that the Christian poet Vexantius Fortunatus composed the celebrated and truly magnificent hymn *Vexilla Regis Prodeunt*. Radegunda outlived her husband by more than a quarter of a century, during which she was regarded as a model of Christian virtue; and her life has formed the subject of many beautiful legends, still popular in Germany and France. Her monastery, before her death, which took place in 587, numbered no fewer than 200 nuns. Her feast is held on Aug. 13, the anniversary of her death.

RADETSKY, JOHANN JOSEPH WENZEL, Count of Radetz, and an Austrian field-marshal, was born at Tzrebnitz, in Bohemia, in Nov., 1766; and in 1784 entered the Austrian military service as a cadet in a Hungarian cavalry regiment, making his first campaign against the Turks in 1788-89. He took part in the Austrian wars with Napoleon, brilliantly distinguished himself, and rose to the rank of lieutenant-field-marshal. After the conclusion of peace, he was stationed mostly in Hungary; but the threatening aspect of affairs in Italy caused him to be sent to take the command of the Austrian army in Lombardy: hostilities were, however, deferred, and Radetsky seized this opportunity of putting Verona in a complete state of defense. The emperor Ferdinand, on his accession in 1836, acknowledged Radetsky's numerous and valuable services by raising him to the rank of field-marshal. The rebellion at last broke out suddenly in 1848, and Radetsky was forced to retire from Milan and continue his retreat to Verona (April 2). His departure was the signal for a general insurrection, only the renowned Quadrilateral (q. v.) and the citadel of Ferrara remaining in the hands of the Austrians; and the revolt of Venice cut off all Radetsky's communications except that to the Tyrol. The Piedmontese army had now effected the passage of the Mincio (May 7), and closely invested

Peschiera, thus rendering Radetsky's position an extremely critical one. He had only 50,000 men to oppose to the Piedmontese army of 41,000 men around Peschiera, a corps of observation 6,000 strong near Mantua, a body of 4,000 guarding the passage of the Mincio, the Roman army of 14,000 men holding the s. bank of the Po, and an army of Venetian insurgents, numbering 15,000, in his rear. Being thus unable to take the offensive, he waited anxiously for the re-enforcements which he expected by the Illyrian frontier, and which, after defeating the Venetian and Roman armies which attempted to stop their progress, joined him at Verona, on May 22. The Austrians now assumed the offensive, and marched on Mantua, defeating the Italians in two bloody conflicts at Montanara and Curtatone, but were in turn signally vanquished at Goito by Charles Albert, who gained by this victory the immediate surrender of Peschiera (May 29), and rendered Radetsky's position more critical than ever. But the gallant Sardinian was no match for Radetsky in generalship, for he wasted his time before Mantua till Radetsky had raised an army of 82,000 men, with which he drove the king (July 22 and 23) back, defeated him at Custoza (July 25), pursued him closely, converted his retreat into a disorderly flight, and again defeated him under the walls of Milan (Aug. 4). (The king was now besieged in Milan, but (Aug. 6) a six months' armistice was agreed to, and war was not resumed by the Piedmontese till Mar., 1849. Radetsky was this time better prepared, and at once invaded Piedmont; after a successful brush with the enemy at Vigevano (Mar. 21), he totally routed them at Novara (Mar. 23), after an obstinate conflict of six hours' duration. Peace was now concluded with Piedmont, and Radetsky next besieged Venice, which surrendered after a long siege (Aug. 23). He was then appointed governor-general of Lombardy and Venice, and ruled with absolute authority till his retirement on Feb. 28, 1857, suppressing all insurrections and disturbances with the utmost rigor. He died at Milan, Jan. 5, 1858, at the age of 91 years. He bore the character of a brave soldier and consummate tactician, and, strange to say, acquired all his European reputation after he had passed his 80th year.

RADFORD, WILLIAM, b. Va., 1808: entered the navy in 1825, rose through successive grades to the rank of rear-admiral, 1866. He distinguished himself at Mazatlan in 1847, and commanded the *Cumberland* in 1861; was on court-martial duty at Old Point Comfort when the *Cumberland* was sunk in her encounter with the *Merrimac*. He was in both battles at fort Fisher 1864-65, in command of the *New Ironsides* under admiral Porter, and in 1869-70 commanded the European squadron.

RADIATA, the lowest of Cuvier's four great divisions of the animal kingdom, derive their name from the organs of sense and motion being disposed as rays round a center; the other three, in ascending order, being the *articulata*, the *mollusca*, and the *vertebrata*. Before Cuvier's time all invertebrate animals were divided into *worms* and *insects*. In 1795 he presented a memoir to the natural history society of Paris, in which, to use his own words, he "marked the characters and limits of the mollusks, crustaceans, insects, worms, echinoderms, and zoophytes;" and in a memoir read before the institute in July, 1812, he "distributed these various classes under three grand divisions, each of which is comparable to that of the vertebrate animals." The necessity for the dismemberment and rearrangement of this heterogeneous assemblage which Cuvier grouped together in his **RADIATA** has long been felt; and at the present day "the radiate mob" (as prof. Huxley terms it) may be regarded as effectually demoiished. To show how these animals have been rearranged, it is necessary first to mention that Cuvier himself divided them into five classes—namely (1) the *echinodermata*, (2) the *entozoa* (or intestinal worms), (3) the *acalephæ* (or sea-nettles), (4) the *polypi*, and (5) the *infusoria*. The *echinodermata* are now included by Huxley (*Elements of Comparative Anatomy*, 1864) in the *annuloida* (one of the eight primary groups into which he divides the whole animal kingdom); while J. Victor Carus (*Handbuch der Zoologie*, 1863), makes them an independent group. The entozoa are placed by Huxley under the *annuloida*, and by Carus under the *vermes*. The acalephæ are by unanimous consent placed in the *coelenterata*, a primary group established by Frey and Leuckart. Of the polypi, those with ciliated arms (the bryozoa or polyzoa, of which the sea-mat or flustra is a well-known example) are now placed among the lower mollusks, which, under the term *molluscoida*, are considered by Huxley as one of the eight primary groups; while the remainder are placed amongst the *coelenterata*. The infusoria are now regarded by most zoologists as a class of the *protozoa* (q.v.), a primary group established by Siebold. See **SUBKINGDOMS, ANIMAL**.

RADIATION, a term applied to the transmission of certain qualities of vibratory motion which take place in the luminiferous ether, producing heat, light, and actinism, or chemical action. All these forms of radiation are produced, according to received theory, by similar undulations in the ether, the only difference being in their length; the longer undulations producing, when impinging upon matter, the greatest amount of heat; the medium-length undulations the greatest amount of light, while the shorter vibrations or wave lengths, included in the more refrangible rays, have the greatest power to sever chemical combinations. See *Radiation* in art. **HEAT, ante**; also **SPECTRUM** and **DIATHERMANCY**. The subject of radiation has received much attention from scientists within a few years, and many interesting discoveries have been made, which go to indicate that the rays of light as well as of heat possess mechanical force which may be converted into continuous motion, the experiments of Mr. Crookes, of London, being

among the most remarkable in this field. See **RADIOMETER**. The results of these experiments have raised a doubt in the minds of some in regard to the undulatory theory of light. Some of the phenomena suggest the action of the direct motion of particles of matter; but such a hypothesis was found long ago insufficient to account for many of the phenomena of radiation, and it is more probable that the theory of undulations will, as it has in all cases so far, afford sufficient explanation for the phenomena now under investigation. See the article **SPECTROPHONE** and **PHOTOPHONE**.

RADIATION OF HEAT. See **HEAT**.

RADICAL (Lat. *radicalis*, fundamental, from *radix*, root), originally *radical reformer*, a name applied to one of the political party which advocates extreme changes of a democratic character in the state.

RADICALS, in chemistry. A radical is a term introduced by one of the fathers in chemistry, Guyton de Morveau, in 1787, but its signification was then more restricted than now, because chemistry was then a more restricted science. Its general meaning, however, allowed it to be gradually extended as the science advanced. It was used to signify a substance which, uniting with oxygen, would form an acid; in other words, it might be called an acidifiable base, either simple or compound. As the science of chemistry advanced and the number of compounds which were studied and produced multiplied, the word radical became to be applied to any simple or compound body possessing the power of uniting with an electro-negative body, or element, to form an acid, neutral, or basic body. But the term is principally applied to compound bodies which are held together in such a way that they do not always break up when the compound of which they form a part is decomposed, or, if they do break up, hold an elemental relation to it. The idea of a compound radical may be expressed thus: Suppose one or more of the component atoms of a fully saturated compound molecule to be removed; it is clear that the remaining molecule or group of atoms will no longer be saturated, but will have a combining power corresponding with the number of units of equivalency removed. Such a remaining molecule or group of atoms is a radical. Methane is a fully saturated compound, CH_4 , but, if one of its hydrogen atoms is removed, there will be left the radical methyl, CH_3 , one molecule of which has the power to unite with one molecule of a univalent element, or two molecules with one molecule of a bivalent element, etc. Ammonia, NH_3 , in which the nitrogen is trivalent, yields, on the removal of a molecule of hydrogen the univalent radical amidogen, NH_2 , which, with one molecule of potassium, forms potassamine, NH_2K , and when combined with one molecule of the univalent radical methyl, CH_3 , forms methylamine, NH_2CH_3 . The loss of two molecules of hydrogen from ammonia leaves the bivalent radical imidogen, NH , which, with two molecules of methyl, forms dimethylamine, NH_2CH_3 , while the removal of all three of the hydrogen molecules from ammonia leaves nitrogen alone, which often acts the part of a trivalent radical, as for example, when uniting with three molecules of potassium to form tri-potassamine, NK_3 , or with three molecules of methyl to form tri-methylamine, NCH_3 . Again, a molecule of water, H_2O , when losing a molecule of hydrogen, becomes the radical *hydroxyle*, HO , a body analogous in its affinities to chlorine, bromine, and iodine. Water, HO, H (H_2O), may therefore be compared to hydrochloric acid, ClH , in which the hydroxyle replaces chlorine, or the contrary, while potassium hydroxide, KHO , may be compared to potassium chloride, KCl . See **CHEMISTRY**.

RADIOLITES, a genus of lamellibranchiate mollusca, found only in cretaceous rocks, and remarkable for the great diversity of its valves. The upper valve is flat or conical, with a central umbo; and the lower is an elongated cone, and has on its inner surface two large dental sockets, and lateral muscular impressions. The upper valve is not perforated with canals, as in the nearly related genus hippurites. More than forty species have been described.

RADIOMETER, an instrument invented by prof. William Crookes of London to measure the comparative intensity of radiation in different colored or heated rays. It consists of a number of delicate arms (usually four), supported at their center of horizontal motion, and above the center of gravity, upon a needle-point, so that they may revolve with the least resistance. Each arm carries at its extremity a very light disk of pith or of mica, blackened upon one side, the blackened surfaces all facing in the same relative direction. The invention was the result of researches on the atomic weight of the metal thallium, in which it was sought to eliminate the error caused by the decrease of weight of a body heated in air. He placed a balance in an exhausted vessel, but this not succeeding he made the following experiment. In an exhausted vessel he suspended a pith bar, while another pith bar was suspended in a vessel containing a natural quantity of air, and found that the bar in the exhausted vessel was repelled by a hot body, while that in the unexhausted vessel was attracted by it. An apparatus, the initial step in the construction of the radiometer, was devised to attain quantitative results. A \perp shaped tube of glass had suspended in it, by a delicate glass fiber, a small horizontal rod carrying upon each end a blackened disk of pith. The suspending fiber was attached above near the upper end of the vertical arm, and also to the middle of the horizontal bar, balancing it. Thus, then, was formed a sort of Coulomb's torsion balance, though not for

electrical measurement. To observe and to measure the motions of the horizontal rod, it had placed at its middle a mirror for reflecting a beam of light on a distant graduated horizontal scale, like that employed in sir William Thomson's marine galvanometer. The slightest revolving motion of the horizontal bar would then cause the reflected ray of light to traverse a considerable portion of the graduated scale. A pure spectrum, obtained by a system of lenses, etc., acting on a beam of light reflected by a heliostat, was employed in its different parts successively to act upon the blackened disks of the balance. The repulsion produced by the different portions of the spectrum, for equal areas, was for each as follows, comparatively: ultra red, 100; extreme red, 85; red, 73; orange, 66; yellow, 57; green, 41; blue, 22; indigo, 8.5; violet, 6; ultra violet, 5. The repelling power diminished inversely as the square of the distance between the disk and the source of radiation, a result naturally to be expected. He found also that a blackened disk was repelled more than five times as much as a plain one. Upon this hint he constructed his radiometer. The cause of the motions has been differently explained, some attributing it to the increased freedom of kinetic vibrations of the residual molecules in the exhausted vessel, and which are more active near the blackened surface; but the question is not settled. Mr. Crookes's investigations will probably lead to other important discoveries in regard to radiation and radiant matter.

RADISH, *Raphanus*, a genus of plants of the natural order *crucifera*, having a spongy siliqua (q. v.), which does not split open when ripe, ends in a conical or awl-shaped beak, and is more or less divided into transverse cells, in some species adhering together even in decay, and in some falling asunder. The flowers are yellow, red, or purple. The common radish (*R. sativus*) has thick, round, tapering, and pointed pods, little longer than their stalks, very slightly contracted, and not falling to pieces. It is an annual, with branching stem from two to four ft. high, rough lyre-shaped leaves, and pale violet-colored flowers with dark veins. It is a native of Asia, from the coasts of the Mediterranean to Japan, and has been cultivated in China, India, and Europe from the most ancient times, for the sake of its fleshy roots, which have a sharp biting taste, and are much used when young as a salad, and also to some extent as a boiled vegetable. In this latter way, the young and tender leaves were also formerly used. The varieties of radish in cultivation are extremely numerous; but they are generally classed under the two heads of *tong-rooted* and *turnip-rooted* radishes, the roots of the former resembling the carrot in shape, and the latter the turnip. The varieties differ very much, not only in form of root, but in color and size, a red color generally prevailing. Some of the dark-colored turnip-rooted radishes attain the size of a man's head. Radishes are sown at different seasons, and are generally used when young and small; but some kinds are occasionally stored for winter. The root of the radish possesses demulcent, stimulant, and diuretic properties, and is sometimes used in cases of atony, or of excessive secretion of mucus by the organs of digestion or the urinary organs. Radish juice, mixed with sugar candy, is a popular and useful German remedy for hoarseness and cough.—Distinct from both the varieties above-named is the oil radish, which has a slender, scarcely fleshy, root, a short much-branched stem, and many-seeded pods. It is cultivated in China for the oil of its seeds.—Another species of radish (*R. caudatus*), a native of Japan, is there cultivated as an esculent. To this genus belongs the jointed charlock of our corn-fields (*R. raphanistrum*), which has found its way from Europe to North America, and is a troublesome weed there also. The seeds, however, may be advantageously crushed for oil.—The sea-radish (*R. maritimus*) is a more rare British species, the roots of which are of fine quality and great pungency.

RA DIUS, in geometry, is a straight line drawn from the center to the circumference of a circle. See **CIRCLE** and **QUADRATURE**. In trigonometry, the radius is taken as unity, and the sines, cosines, etc., are expressed in terms of it. In astronomy the same term is employed in a slightly different sense; and to prevent confusion it is changed into *radius-vektor*. The radius-vector is a straight line drawn from the center of force to the position of a body which describes its orbit round that center; if the orbit is a circle, the radius-vector is invariable in its length, but constantly changes if the orbit be any of the other conic sections. From astronomy the term has been transferred to what are called *polar equations* in the higher mathematics. To express a curve by this method a point is taken for the *pole*; through this point a line, the *axis*, is drawn, indefinite in length and arbitrary in direction: then as one end of the radius-vector is at the pole, its inclination to the axis, and its length at this inclination, will give a point in the curve. Equations to curves, when thus expressed in terms of the radius-vector, and its inclination to the axis, are called *polar co-ordinates*, and are generally much simpler in form than when expressed by rectangular *co-ordinates* (q. v.).

RAD'NOR, NEW, a municipal and parliamentary borough in Radnorshire, of which it was formerly the capital, stands in the midst of exceedingly wild and hilly scenery, on the south border of Radnor forest, and 8 m. w.s.w. of Presteigne. In the immediate vicinity is the cascade of *Water-break-its-neck*, which descends from a height of 70 ft., and is one of the most celebrated in Wales. New Radnor, once comparatively important, has dwindled into a small country town, remarkable only for the beauty of the surrounding scenery. In 1864 a statue in memory of sir George Cornwall Lewis was erected

at New Radnor. Pop. (of parliamentary borough) in '71, 2,190. The business of the county is transacted at Presteigne, the county town, which contains, '71, 1,910 inhabitants.

RADNORSHIRE, an inland co. of south Wales, bounded on the n. by Montgomeryshire and Shropshire, and on the s. and s.e. by Brecknockshire and Herefordshire. Area, 276,552 acres; pop. '71, 25,430. Groups of mountains, seldom forming themselves into continuous chains, cover the greater part of the surface of the county. Radnor forest, which attains the height of 2,163 ft., runs e. and w., and is the loftiest and most connected of the rangs. The south-eastern district is flat, with a gradual slope toward the east. Of the rivers, the chief of which flow southward, the principal is the Wye (which forms the greater part of the southern boundary of the county), and its tributaries the Ithon, the Elan, and the Lugg. The county formerly comprised large tracts of bog and moor land, which are in course of being gradually reclaimed and cultivated. Its valleys, especially that watered by the Lugg, are famed for the richness of their pastures, which feed splendid herds of "Herefords." In the e. and s.e. districts of Radnorshire excellent wheat, barley, oats, and potatoes are grown. Though rather more than half the county is cultivated, yet of this less than a third is under the plow, fully two-thirds being in permanent pasture, chiefly for rearing sheep. The county returns one member to the house of commons.

RA DOM, a government of the kingdom of Poland (q.v.), is situated to the s. of the government of Warsaw. Area, 4,755 sq.m.; pop. '70, 532,466. The surface, partly traversed by the Sandomir mountains, which rise in the Katherinenberge to the height of upward of 2,000 ft., is the most elevated of the kingdom. The principal rivers are the Pilica and the Vistula, both of which flow north. The soil is diversified.

RADOM, capital of the government of the same name, stands on the Radomka, 69 m. s. of Warsaw. It has considerably improved in size within late years, and is the seat of an active trade and commerce. Pop. '67, 10,944.

RADOWITZ, JOSEPH VON, Prussian general and statesman, b. Feb. 6. 1797, at Blankenburg, was the son of a nobleman of Hungarian descent, received his professional education at Paris, and in the military school of the kingdom of Westphalia, which he left in 1813, in order to enter the Westphalian army as an officer. After the peace in 1815 he received an appointment as master of mathematical and military sciences in the military school of Cassel; but in 1823 he entered the Prussian service, and in 1830 became chief of the general staff of artillery. By his marriage with the countess Maria v. Voss (1828), he became connected with the Prussian aristocracy, and soon became the leader of the anti-revolutionary party. In 1836 Radowitz was sent as Prussian military commissioner plenipotentiary to the German diet at Frankfort. In 1842 he was named ambassador extraordinary and minister plenipotentiary at the courts of Carlsruhe, Darmstadt, and Nassau; and in 1845 he was raised to the rank of maj.gen. Meanwhile his influence on public affairs in Germany became more and more conspicuous; above all, he was the confidant and adviser of king Frederick William IV. in his endeavors to bring about a reform of the German diet, as his pamphlet, *Germany and Frederick William IV. (Deutschland und Friedrich Wilhelm IV., Hamb. 1848)*, proves. His *Conversations about State and Church*, suggested by the present state of affairs (*Gespräche aus der Gegenwart über Staat und Kirche*, Stuttg. 1846), may be taken as a manifestation of the intentions which tried to find a practical issue in the constitution of Feb. 3, 1847. When the revolution of 1848 broke out, a new field opened itself for Radowitz. The endeavors of Prussia to give a constitution to Germany, by means of the alliance of the three kings, was principally his work. He now obtained the leadership of the affairs of the union in the Prussian chambers as well as in the parliament, which assembled (March, 1850) at Erfurt, but was unable to prevent the failure of the union scheme. On Sept. 27, 1850, he became formally secretary for foreign affairs, but in 1851 retired to Erfurt, where he wrote his *Neue Gespräche aus der Gegenwart* (2 vols. Erf. and Leip. 1851). He died Dec. 25, 1853.—Consult Frensdorff, *Joseph v. R. A.* (Leip. 1850).

RAEBURN, SIR HENRY, R.A., a distinguished portrait-painter, was b. on Mar. 4, 1756, at Stockbridge, then a village near Edinburgh, where his father was a manufacturer. His parents died when he was little more than six years old, and he was educated in that well-known institution, George Heriot's hospital. He was apprenticed to a goldsmith and jeweler when about 15 years of age; but having a very decided taste for art, he practiced miniature-painting during his leisure hours with such success that he was soon enabled to buy up his indenture and devote himself first to miniature, and not long after to portrait-painting in oil. He married when he was 22, and acquired some fortune by his wife. Proceeding to London, with introductions to sir Joshua Reynolds, he was kindly received by him, and practiced in his studio for about two months. Sir Joshua very soon perceived the high talent evinced by the young artist; advised him to visit Rome, and offered him funds for the purpose. Acting on this advice—he had funds sufficient—Raeburn set out, furnished with letters from Reynolds to Pompeo, Battone, and other artists of note in Rome at the time. After remaining two years in Italy, he returned, and settled in Edinburgh in 1787, where he soon received full employment as a portrait-painter. In 1812 Raeburn was elected president of the society of artists in Edinburgh; in 1814, associate of the Royal academy of London, and in the following

year, academician. He was knighted in 1822, when George IV. visited Scotland, and shortly after was appointed king's limner for Scotland. He died at Edinburgh on July 8, 1823. Raeburn's style was modeled in a great degree on that of Reynolds—he aimed, like him, in his pictures to produce breadth—which is the effect obtained by massing together and keeping as far as possible the lights distinct from the shadows, and making them respectively effective, in place of dividing and mixing them up all over the picture; but he carried out this principle in a manner and with a feeling peculiarly his own. He never attempted, by thick impasto and semi-transparent painting, to produce texture and luminous effect, but adopted the opposite mode of painting in a low tone with a sharp touch, working his colors with little admixture of any unctuous medium. In his portraits of men, in particular, he gives the characteristic expression in a simple but decided and effective manner. His style has been thought by connoisseurs to resemble in many respects that of Velasquez. Raeburn's reputation was very high in his lifetime, and it is still rising, his pictures being now much sought after. Among the notable personages who sat to Raeburn for their portraits were sir David Baird, sir Walter Scott, Henry Mackenzie, Neil Gow, Harry Erskine, Dugald Stewart, prof. Playfair, Francis Jeffrey, Henry Cockburn, and many Scottish nobles. An exhibition of his works was held at Edinburgh in 1876.

RAFFAELLE. See **RAPHIAEL**, *ante*.

RAFFLES, THOMAS, D.D., LL.D., 1788–1863; b. London; studied theology at Homer-ton college; in 1809 settled as pastor of the Independent church at Hammersmith, and in 1812 as successor of the gifted Thomas Spencer at Great George street chapel, Liverpool. He resigned his charge in 1860. He was eminent among the Independents as a theologian and preacher. He published *The Life and Ministry of the Late Thomas Spencer*, which passed through many editions; *Letters during a Tour through some parts of France, Savoy, Switzerland, Germany, and the Netherlands*; *Lectures on Christian Faith and Practice*; and many hymns.

RAFFLES, Sir THOMAS STAMFORD, a distinguished traveler and naturalist, was the son of a captain in the West India trade, and was b. at sea, off port Morant in Jamaica, on July 5, 1781. His first appointment was to a clerkship in the East India house. Having attracted the notice of his superiors by his talents and industry, he received a permanent appointment in the office. In 1805 the court of directors determined on sending out an establishment to Penang or Prince of Wales' island, and young Raffles was appointed assistant-secretary. He arrived at Penang in September of the same year; and having studied the Malay language with great diligence during the voyage, he was enabled to enter upon his duties with efficiency on his arrival. He continued his study of the Malay and other eastern languages, in which he made considerable progress. Eventually Raffles was made principal secretary. In 1808 he made a voyage to Malacca, where he had the opportunity of mixing with Javanese, Amboynians, Borneans, Papuans, Cochin-Chinese, and Chinese proper. With respect to Malacca itself, he collected much interesting information. In 1811, when it was resolved by the English government to take possession of Java, then belonging to the Dutch, it was arranged that Mr. Raffles should accompany the expedition as secretary to the governor-general, lord Minto, who was himself to take the chief command. After some hard fighting the troops took possession of the island. Mr. Raffles received the appointment of lieutenant-governor of Java and its dependencies; and, upon the departure of lord Minto, took upon himself the entire administration of the newly-acquired territory. Much had still to be done in the way of conciliating the native princes and chiefs to the British rule. He had to appoint British residents at several of the native courts, and to frame rules and regulations for their conduct. He ordered a general survey to be made of the whole island, the reading of which, as well as of all the reports connected with that and other things, occupied a considerable part of his time. By frequent personal interviews with the natives also he sought to become acquainted with their manners and character, and to make such regulations as would be for their best interests, both morally and materially. While engaged in this career of usefulness his health gave way; and in 1816 he returned to England, stopping by the way at St. Helena, where he had an interview with Napoleon. On his arrival in England he wrote his well-known *History of Java*, published in two volumes 4to in 1817, in which year he received the honor of knighthood. Java having by this time been restored to the Dutch, sir Stamford Raffles was appointed lieutenant-governor of Bencoolen, a settlement upon the coast of Sumatra, where he landed in March, 1818. In the latter part of that year he was called to Calcutta, on a visit of business, and instead of returning directly to Bencoolen, was sent to form a new settlement at Singapore. Here he remained for some months, and then again returned to Bencoolen, where he continued to discharge the duties of lieutenant-governor until Feb., 1824, when he was compelled by ill health to return to England. The vessel in which he set sail took fire, the crew and passengers escaping with difficulty in the boats. By this accident sir Stamford Raffles lost the greatest part of his effects, including a fine collection of natural history, and other things, valued at about £20,000. After his arrival in England he lived to carry out what had been one of his favorite projects—namely, the formation of the zoological society of London, of which he was named president, and

to the interests of which he devoted himself to the time of his death. This took place on July 5, 1826.

RAFFLESIA, a remarkable genus of plants belonging to the small natural order *rafflesiaceae*, an order composed entirely of parasitic plants, which consist merely of a flower, and form part of the *rhizogens* (q.v.) of Lindley. The *rafflesiaceae* are natives partly of the Indian islands and partly of South America. The plants of the genus *rafflesia* have neither stalk nor leaves, but are mere flowers seated upon the roots of species of *cissus*, making their appearance at first as a hemispherical swelling of the bark of the root, and, after the bark has broken, rising up in the form of a head of cabbage, whilst the perianth is covered with imbricated bracteae, which are more or less recurved after it has opened. The perianth is thick, fleshy, and 5-partite. The germen is inferior, and contains many ovules; and the anthers, which are numerous, are seated under the revolute margin of the top of the style column. After the flower has expanded, it diffuses a carrion-like smell, that even attracts flies, and induces them to deposit their eggs. The largest and first-discovered species, *R. Arnoldi*, was discovered in 1818 in Sumatra by Dr. Arnold, and was sent to the eminent botanist, Robert Brown, by Sir Thomas Stamford Raffles, the British governor in Sumatra. Its flower measures fully 3 ft. in diameter, is capable of containing almost two gallons of fluid, sometimes weighs 10 lbs., and is the largest of all known flowers. A smaller species, *R. patma*, whose flowers are 16 in. to 2 ft. in diameter, is highly prized by the Javanese as a medicine, for its strong styptic powers. *R. Horsfieldii*, another Javanese species, is still smaller, its flowers being only 3 in. broad.

RAFN, KARL CHRISTIAN, a celebrated Danish critic and archaeologist, was b. at Brahesborg, in the island of Fünen, Jan. 16, 1796, and educated at the university of Copenhagen, of which he was appointed sub-librarian in 1821. Even while a boy at the gymnasium of Odense, he was distinguished by his fondness for the old Norse literature and language, and when he became officially connected with the university, he undertook a general revision of all the Icelandic and old Norse MSS. preserved there. It is to Rafn's unwearied exertions that Denmark owes the foundation (1825) of the "Society for Northern Antiquities," whose principal object is the publication and criticism of all documents that can throw light on the subject of old Norse literature. To this single end Rafn devoted his whole life. As secretary of this society he edited and published a great many ancient Scandinavian MSS., occupying about 70 volumes. Among his numerous important works, we may mention a Danish translation of Norse Mythic and Romantic Sagas (3 vols., 2d ed. 1829-30); an edition (from a manuscript), with philologico-critical remarks, of Ragnar Lodbrog's death-song, under the title of *Krákumál, seu Epicædium Ragnaris Lodbroci, Regis Danicæ* (Copenh. 1826); a complete collection of the Norse sagas (many of these MSS. being hitherto unedited) entitled *Fornaldar-Sögur Nordlanda* (Copenh. 3 vols., 1829-30); and the *Páreyinga-Saga* (1832) in Icelandic, with translations in Danish and Faroese, and a critical apparatus. But his most widely-known and perhaps his most interesting work is his *Antiquitates Americanae, seu Scriptores Septentrionales Rerum Ante-Columbianarum in America* (Copenh. 1837), in which, from a critical examination of numerous geographical, nautical, and astronomical data in certain Old Norse MSS., he comes to the conclusion that America was discovered by Norsemen in the 10th c., 400 years before Columbus was born; and that from the 11th to the 14th century a large tract of the North American coast had been visited and even partially colonized as far s. as Rhode Island and Massachusetts—a conclusion, it may be added, the probability of which has been confirmed in several important points by recent topographico-antiquarian researches in these states. The subject was followed up by him and Finn Magnussen in their *Historical Monuments of Greenland* (3 vols., Copenh. 1838-45). Another very important work to which Rafn furnished a great part of the text, carefully worked up from MSS., and a Danish translation of the first three and the 11th books in parallel columns, is the great collection of historical sagas representing events that took place out of Iceland, and entitled *Forumanna Sögur* (12 vols., Copenh. 1828, et seq.). He has also had a great share in drawing up and editing the Icelandic MSS. relating to the history of Russia and other eastern countries, and of which two volumes appeared at Copenhagen in 1850-52, under the title of *Antiquités Russes*. Rafn died at Copenhagen, Oct. 20, 1864.

RAFTERS, the sloping timbers of a roof (q.v.) which meet in an angle at the ridge, and on which rest the laths or boarding which carry the tiles or slates.

RAGGED SCHOOLS. The ragged school, as distinct from the certified industrial school, is a voluntary agency providing education for destitute children, and so preventing them from falling into vagrancy and crime. Vagrant children, and those guilty of slight offenses, are provided for in the certified industrial school; but the two institutions are frequently combined. See article INDUSTRIAL SCHOOLS. The movement which established ragged schools was almost simultaneous with that which instituted reformatories. John Pounds, a poor shoemaker at Portsmouth, has the honor of originating the idea. For 20 years, up to the time of his death in 1839, he gathered the ragged children of the district round him as he sat at work. They came freely, and were taught gratuitously. The success attending his humble efforts soon led many more influential friends of the "outcasts" to engage in the same work. In 1838 London had a ragged

Sunday-school, which eventually became a free day-school. Field Lane followed in 1843. But the first ragged feeding-school was opened in 1841 by sheriff Watson, in Aberdeen. In 1845 Dr. Robertson, not then aware of the existence of sheriff Watson's, opened a similar school in the Vennel, Edinburgh. Soon afterward Dr. Guthrie's famous *Plea for Ragged Schools* appeared, a work which gave an irresistible impetus to the movement, and caused the author to be generally regarded as the father of ragged schools. After this ragged schools spread over all the land, until there was scarcely a town of any importance that had not one or more. The recent education acts, however—that for England, 1870, and that for Scotland, 1872—introduced the principle of compulsory attendance at school; under this provision, a large number—especially in England—of such as were merely free day-schools have become public schools. But as the education acts make no provision for feeding the children, the managers of feeding-schools find themselves compelled to continue their efforts. In places where the system has been efficiently conducted juvenile crime has sensibly diminished. The governor of the Edinburgh prison has stated frequently in his reports, that since the establishment of ragged schools, the number of young persons committed to prison has gradually decreased. It may be mentioned that in one large ragged feeding-school, where in the course of 10 years 4,000 children have been enrolled, only 7 deaths have occurred during the period of school attendance. The ragged schools do not receive government aid. The capitation grant of £2 10s., allowed by a privy council minute in 1856, was withdrawn in 1859.

RAGGEE, *Eleusine corocana*, an Indian grain (see ELEUSINE), very prolific, but perhaps the least nutritious of the cereals, although it is the chief food of the poorer classes in Mysore and on the Neilgherries. It is made into dark-brown cakes and porridge, which are described as very poor fare.

RAGHU is, in the legendary history of ancient India, the name of a celebrated king of Ayodhyā. See OUDE. He belonged to the royal dynasty which derived its origin from the sun; and among his descendants is Rāma (q. v.). See also the next article.

RAGHUVANSA (from *Raghu* (q. v.) and *vans'a*, race or family, hence "the family of Raghu") is the title of one of the most celebrated poems of Sanskrit literature, attributed to the authorship of Kālidāsa (q. v.). It consists of 19 sargas—i. e., sections or cantos—and its subject-matter is the legendary history of the kings of the solar race, beginning with that of Dilīpa, the father of Raghu, and ending with that of Agnivarn'a. The text of the poem, with an excellent Latin translation of it, was published by prof. A. F. Stenzler (London, 1832); the text, with a prose interpretation in Sanskrit, by Pandits of the Sanskrit college of Calcutta (1831); and the text with the complete and important commentary of Mallinātha, by Girīśachandra Vidyārātna, one of the professors of the government Sanskrit college (Calcutta, 1852). Single cantos with the same commentary have also been published at Bombay and Madras.

RAGLAN, Lord, FITZROY JAMES HENRY SOMERSET. Field-marshal, G. C. B., eighth son of the fifth duke of Beaufort, was b. Sept. 30, 1788. He entered the army in his 16th year, and in 1807 served on the staff of the duke of Wellington in the expedition to Copenhagen. He went to the Peninsula as aid-de-camp to the duke, and in 1812 became his military secretary. As lord Fitzroy Somerset, his name became a household word. He was present at all the great actions of the Peninsular campaign which illustrate the career of the great commander. He was among the first to mount the breach at the storming of Badajoz, and it was to him that the governor gave up his sword. On the return of Napoleon from Elba, he served under the duke in Flanders, and lost his sword-arm in the crowning victory of Waterloo. The very next day he was seen practicing writing with his left hand! For his brilliant military services he was made K. C. B., and received orders from several foreign potentates. He was minister-plenipotentiary at Paris in 1815, and secretary to the French embassy from 1816 to 1819. The duke was appointed in 1819 master of the ordnance, and Raglan again became his secretary. In 1822 he went to the congress of Verona in attendance on the duke, who was the English plenipotentiary. In 1827 the duke was appointed commander-in-chief of the British army, and called Raglan to the horse-guards as his military secretary. This office he held until the death of his chief in Sept., 1852. He was then made master-gen. of the ordnance, and in October was called to the house of peers as baron Raglan of Raglan, in the co. of Monmouth. He had previously sat in the lower house during the parliaments of 1818 and 1826 for the borough of Truro. While master-gen. of the ordnance, he was appointed, with the rank of gen. while so employed, commander of the English forces which were dispatched to Turkey in Feb., 1854. The allied armies of Britain and France, under Raglan and marshal St. Arnaud respectively, made good their landing in the Crimea. The victory of the Alma, the flank-march to Balaklava (q. v.), the cavalry charge which has made that place immortal, the sanguinary and desperate infantry-battle of Inkermann (q. v.) (which obtained for Raglan the baton of field-marshal), and the siege of Sebastopol, are too well known to need description. Unfavorable comments began to be made, as the campaign proceeded, upon Raglan's conduct of the war. During the winter, 1854-55, his soldiers suffered unspeakable privations, and hundreds perished in camp and on board transports for want of the food, clothing, and medicines which were in store, but could not be found in the confusion and mismanagement that

prevailed. Supplies arrived; but the siege continued without much apparent success until June 18, when a general assault was ordered, and when Raglan's troops, as well as the French, received a terrible repulse. Raglan had been suffering from a slight attack of cholera, and the disaster of June 18 weighing upon his mind, he suddenly became worse, and died of exhaustion, June 28, 1855. His remains were brought to England, and buried in the family cemetery at Badminton. Raglan was an indefatigable and experienced administrator. He proved himself to be a skillful tactician, although it may be doubted whether he had the qualities of a great general. He was undeniably gifted with many qualities that shone with great luster in the field as well as in council. His demeanor in action was so calm that it excited the admiration of the French, and marshal St. Arnaud declared that his bravery rivaled that of antiquity. His courteous and noble bearing, his gentleness of temper and firmness of mind, and his constant worship of "duty," invest his character with something of the chivalrous. See Kinglake's *Invasion of the Crimea*.

RAGMAN ROLL (*ragman*, a word of uncertain origin, used in ancient diplomatic language for an indenture or legal deed), the name given to the collection of instruments which record the acts of the fealty and homage performed by the Scottish nobility and gentry to Edward I. of England during his military progress through Scotland in 1296, and afterward at the parliament held at Berwick. The original instruments of homage under the seals of the parties were deposited in the royal treasury of England, and have almost entirely perished; but the roll in existence in the Tower preserves a record of them. Its contents were given in an abridged form in *Prynne's Records*, and afterward printed *in extenso* by the Bannatyne club in 1834. An especial value attaches to the Ragman Roll as containing the largest and most authentic enumeration extant of the nobility, barons, landholders, and burgesses, as well as of the clergy of Scotland, prior to the 14th c., and the only genuine statistical notices of Scotland of the period.

RAGOÛT (Fr. *ragoûter*, to revive the appetite; appears to be from Lat. *re-ad-gustare*), a name much less in use now than formerly, for a dish of stewed meat and vegetables, usually flavored with herbs and other condiments. It differs but little from the olla of the Spaniards, and the pilau of the Turks.

RAGS. Fragments of nearly all textile materials have now a commercial value; those of cotton, linen, and hempen cloths are used in the manufacture of paper (q.v.); and woolen and worsted rags are made available for respinning either alone or mixed with fresh wool, while the refuse is ground into powder, dyed various colors, and forms the material called flock, used by the paper-stainers to produce their ornamental flock-papers. The trade in rags is enormous. Linen and cotton rags to the extent of from 15,000 to 16,000 tons per annum, of the value of nearly £200,000, are now imported by British paper-makers, and perhaps quite as large a quantity is collected at home. The greatly increased use of esparto makes the import of rags of less cardinal importance than it used to be to the paper-makers of this country. See SHODDY; and RAG-TRADE.

RAG TRADE. This trade, even within the limits of a generation, has undergone extraordinary changes. Woolen rags, which some 30 years ago were all allowed to rot on the dunghill, save the very small quantity required for flock papers and stuffing saddlery, are now consumed, under the name of "shoddy," to a vast extent in the manufacture of the cheaper woolen cloths, more than 30,000 tons having been imported in 1873; and in the same year, probably a like quantity was obtained in Great Britain itself.

Linen and cotton rags are, as is well known, nearly all consumed in the manufacture of paper; but of late years the demand for paper has increased at so great a rate, especially for the American and colonial markets, that rags can no longer be looked upon as the principal raw material from which it is made. It was stated by Mr. Rutledge, to whom the country is mainly indebted for the successful introduction of esparto fiber, at a meeting of the London society of arts, in Dec., 1871, that rags were now used alone only for the paper of bank-notes, ledgers, and such-like special purposes, esparto fiber being even preferred as a material for printing-paper. Wood pulp is also largely used on the continent, as well as in America, to mix with rags for all kinds of papers, often forming as much as 70 per cent of their weight. For some time past the amount of cotton and linen rags annually imported into Great Britain has been below 20,000 tons; while the imports of esparto and other vegetable fiber reached, in 1876, the amount of 130,911 tons. Moreover, no less a quantity than 22,925 tons of rags and other paper-material, but chiefly rags, were exported from British ports, nearly the whole of which went to the United States.

Unfortunately, there seems but too much reason to fear that the regular supply of esparto, as the staple material for paper, cannot be depended upon; and even though it could, rags will always be of great value for the better kinds. Mr. William Arnot, in a lecture delivered before the society of arts, London, in Dec., 1877, estimated the quantity of paper annually consumed in different countries as follows: In Russia, 1 lb. per head of the population; Spain, 1½ lb.; Mexico and Central America, 2 lbs.; Italy and Austria, 5 lbs.; France, 7 lbs.; Germany, 8 lbs.; United States, 10½ lbs.; and Britain, 11½ lbs. Britain had 385 mills, producing annually 360,000 tons of paper, valued at £20,000,000. When the continent had more rags than it required, England and America had to import rags to keep their mills going. The state of matters is still the same as regards

the continent; but, in the mean time, the increased use of esparto appears to admit of England sending away as many rags as she imports. Most of the imported linen rags come from Germany and France. Cotton, flax, and jute waste from spinning-mills are all used for paper-making.

It is believed that the home supply of linen and cotton rags might be largely increased by greater care in housekeeping economy. Mr. Herring, partner in a firm of paper-merchants, and author of several articles on this branch of industry, published in 1860 a "letter," addressed to clergymen and others, suggesting an organized plan for the attainment of this object. "There are," he remarks, "more rags wasted, burned, or left to rot than would make our paper-manufacturers independent of all assistance from abroad." Whatever may have been the case in 1860, it is plain that, however carefully collected, all the rags produced in Great Britain would now be far short of meeting the demands of our paper-mills if no other material were used.

The managers of the ragged schools in London organized a *rag-collecting brigade* in 1862 for the systematic collection of the rags of the metropolis.

RAGULY, in heraldry, a term applied to an ordinary whose bounding lines are furnished with serrated projections.

RAGUSA (Slav. *Dubrovnik*, Turk. *Paprovnik*), formerly an independent republic, now a decayed episcopal town and sea-port of Austria, in the crown land of Dalmatia, lies at the base and on the steep slopes of mount Sergio, 40 m. w.n.w. of Cattaro. Its higher streets communicate with its lower by means of flights of steps. It is surrounded on the land side by double walls, surmounted by old towers. Immediately s. of the town is a harbor, which admits only small vessels; but 2 m. w. is Gravosa, the proper harbor of Ragusa, and which offers secure and spacious accommodation to the largest vessels. The trade of Ragusa, which was once extensive and profitable, has sunk, and its inhabitants, 6,000 in number (about a sixth of the former population), support themselves by the manufacture and export of oil (very excellent), soap, liquors, malmsey wine, silk, leather, and tobacco. Ragusa also carries on a considerable transit trade with Turkey by means of the Turkish caravans, about 200 of which—in all about 7,000 horses—visit the town annually.

Ragusa is supposed to have been founded in 656 by refugees from Old Ragusa (the ancient *Epidaurus*, situated 10 m. s.e.), which was at that time destroyed by a tribe of Slavonians. It formed itself, after the model of Venice, into an aristocratic republic, governed by a rector. In 1358 it placed itself under the protection of Hungary, and later it became tributary to the porte. Napoleon in 1808 abolished the republican government of Ragusa, and incorporated the town with the province of Dalmatia. After 1814 the town, together with the province, came into the possession of Austria.

RAGUSA, an old t. in the s. of Sicily, in the province of Syracuse, and 30 m. w.s.w. of the city of that name, stands on a narrow and steep ridge between two ravines, on the right bank of the Ragusa, and about 15 m. from the sea. In the cliffs below the walls and around the town ancient tombs of various shapes have been hollowed out. Ragusa is supposed to occupy the site of the ancient *Hybla Minor*. Pop. '72, 21,546, who manufacture cotton, woolen, and silk goods.

RAGWORT, the common English name of those species of *Senecio* (q.v.) in which the heads of flowers have a spreading ray, the involucre has small scales at the base, and the leaves are pinnatifid. The British species are large coarse weeds, with erect stem, and yellow flowers; one species, the COMMON RAGWORT (*S. Jacobaea*), a perennial, is too plentiful in many pastures. It is refused or disliked by horses, oxen, and sheep. It generally disappears from thoroughly drained land, at least after a little labor has been expended in grubbing up its roots. The fresh herbage has been used to dye wool green, but the color is not permanent.

RAG-STONE, an impure limestone, consisting chiefly of lime and silica, much used in Kent. It breaks up into pieces about the size of a brick, and is hard and flat-bedded. The name is also applied to the hard irregular rock which frequently overlies better building materials. Besides being used for building purposes, hones or sharpening stones for scythes and other large blades are made of it.

RAHDUNPUR, a large fortified t. of Hindustan, in a protected state of the same name, in the n.w. of Guzerat, about 150 m. n.w. of Baroda. The majority of the inhabitants, who are chiefly Rajputs and coolies, are engaged in agriculture; trade and manufactures, however, are carried on to some extent. Coarse cotton cloths—the staple manufacture—and grain, leather, and hides are exported. Pop. 15,000. The state of Rahdunpur, which is under British protection, has an area of 850 sq.m., and a pop. of 91,500. The climate, very hot during October and November, is delightful from December to April.

RAHU is, in Indian mythology, the demon who is imagined to be the cause of the eclipses of sun and moon. When, in consequence of the churning of the milk-sea, the gods had obtained the *amr'ita*, or beverage of immortality, they endeavored to appropriate it to their exclusive use; and in this attempt they had also succeeded, after a long struggle with their rivals, the Daityas, or demons, when Rahu, one of the latter, insinuating himself among the gods, obtained a portion of the *amr'ita*. Being detected by the sun and moon, his head was cut off by Vishnu; but the *amr'ita* having reached his

throat, his head had already become immortal; and out of revenge against sun and moon, it now pursues them with implacable hatred, seizing them at intervals, and thus causing their eclipses. Such is the substance of the legend as told in the *Mahābhārata* (q.v.). In the *Purān'as* (q.v.) it is amplified by allowing both head and tail of the demon to ascend heaven, and produce the eclipses of sun and moon, when the head of the demon is called *Rāhu*, and his tail *ketu*, both, moreover, being represented in some *Purān'as* as the sons of the demon *Viprachitti* and his wife *Sinhikā*. In the *Vishn'u-Purān'a*, *Rāhu* is also spoken of as the king of the meteors.—In Hindu astronomy *Rāhu* is personified as the moon's ascending, and *ketu* as the moon's descending, node.

RAHWAY a city of New Jersey, on the Rahway river, 5 m. from its mouth, and the New Jersey railway, 19 m. w. of New York. It contains numerous manufacturing establishments, a large proportion of which are for carriages. Pop. '60, 7,130; '70, 6,258.

RAIKES, ROBERT. See SUNDAY-SCHOOLS.

RAIL, *Rallus*, a genus of birds of the order *grallæ*, and family *rallidæ*, having a slender bill, longer than the head, the body of a very compressed form, wings of very moderate length, a very short tail, long and strong legs, and long toes. The only European species is the COMMON RAIL or WATER RAIL (*R. aquaticus*), sometimes called *bilcock*, a bird which occurs in almost all parts of Britain, and is not unfrequent in marshy situations and the reedy margins of lakes and rivers, although it often eludes observation, threading its way among reeds—for which its compressed form seems specially adapted—and diving when compelled to betake itself to open water. It does not rise, except in extreme necessity; and when flushed, flies heavily. It is more plentiful in most parts of the continent than in Britain; and is there generally a bird of passage, breeding in the north, and migrating southward on the approach of winter. It makes its nest of coarse grass and sedges among thick aquatic plants. The whole length of the bird is about eleven inches and a half. The sexes are very similar in plumage, olive-brown, marked with black above; bluish-ash color beneath, with white transverse markings on the belly. The water-rail feeds on worms, mollusks, and soft vegetable substances. It is in the highest esteem for the table.—America produces a number of species of rail, as the VIRGINIAN RAIL (*R. Virginianus*), a species rather smaller than the water-rail of Europe, and much resembling it in its habits; a bird of passage, and in many parts of North America very abundant; the GREAT RED-BREADED RAIL, or FRESH-WATER MARSH HEN (*R. elegans*), a much larger bird, fully 20 in. in length, inhabiting the extensive marshes of the southern states of North America; the CLAPPER RAIL, or SALT-WATER MARSH HEN (*R. crepitans*), extremely abundant in the salt-marshes of the same regions, its whole length about 15 in.; all of which are much esteemed for the table, the eggs of the clapper-rail being also collected in great numbers as a delicacy. The name clapper-rail is from the cackling cry which the bird seems to delight in emitting.—The MANGROVE HEN (*R. longirostris*) abounds on the muddy shores of the West Indies, and its flesh is held in the highest esteem.—In general form, and in the character of their plumage, all these and other species are very similar.

RAILS, in architecture, are the horizontal bars in paneled stone or wood work, such as doors, shutters, etc., which inclose the panels, the upright pieces being termed styles.—The word is also applied to the level piece over balusters or between posts.

RAILWAYS. The origin of these now vast undertakings is traced to a contrivance for simplifying the transit of coal from the mines in Northumberland and Durham to the places of shipment on the Tyne and Wear. The invention consisted of a double parallel line of wooden beams or trams fixed to the ground, and furnished with flanges to prevent the wheels of vehicles from slipping aside. Along these flanged beams wagons were drawn by horses with such comparative ease that instead of a load of 17 cwt. by a common road, a load of 42 cwt. could now be drawn by a single horse. These new thoroughfares, called tramways, were made across fields, the proprietors of which received a certain rent for the way-leave or use made of them—which term, way-leave, is still employed in arrangements of this kind. To the coal districts of the n. of England, therefore, is indisputably due the simple yet meritorious contrivance which, from less to more, led to the modern railway, with all its wonderful machinery; nor is it useless to note that the invention, in its early stages, owed nothing to men of education or high scientific attainments, but was mainly the work of obscure mechanics and illiterate enthusiasts.

The date of the invention of tramways is uncertain, but by good authorities it is referred to the period between 1602 and 1649. From the northern coal districts it gradually came into use in other mining districts in England, as also in the s. of Scotland. The 17th c. was not favorable to mechanical improvement. Not till about 1700 was there any marked advance on the original tramway. The first step was the clothing of the wooden beams with long slips of iron, to prevent excessive tear and wear. This also being found defective, a second and more complete improvement, about 1740, was the substitution of cast-iron rails fixed in parallel lines on cross wooden sleepers. This species of railway became pretty general in mining districts between 1745 and 1775. In the former of these years, one was in operation in Scotland—namely, a short coal-line from Trant to Cockenzie, which gen. Cope selected as a position at the battle of Prestonpans. Though now considerably improved, railways did not attract attention as being suitable for general traffic. The success of canals not only turned the public

mind in that direction, but raised up a powerful canal interest, which viewed the progress of railways with extreme jealousy and ill-will.

The use of cast-iron rails led to an improved method of traction. Instead of employing a single large wagon, the plan of linking together a series of smaller wagons was adopted—the germ of the modern train. The next improvement consisted in putting flanges on the wheels instead of the rails, by which great facility of transit was afforded. The draught still continued to be executed by horses; but as the railway system seemed to possess immense capabilities of expansion, many minds labored in devising schemes to substitute steam-apparatus. The invention of the locomotive, like that of railways, was the work of successive geniuses. Watt had shown the practicability of fixed steam-engines; what was now wanted was an engine that would travel by its own internal impulse. The merit of inventing a self-acting steam-carriage is allowed to be due to Richard Trevethick, a clever but eccentric engineer. In 1802 he took out a patent for a steam-carriage, and this novel machine he exhibited to large crowds of admiring spectators on a piece of ground near London. Immediately afterward he adapted his carriage for the drawing of wagons on railways, a duty which it successfully executed on the Merthyr-Tydvil railway in 1804. This was the first locomotive; but it was far from perfect. It drew only 10 tons of bar-iron at the rate of 5 m. an hour. Trevethick did not remain in England to improve on his invention, nor did the moderate achievements of his machine immediately induce others to make any distinct advance on his ingenious contrivance. For this lethargy there were various causes; but the principal consisted in a universal belief among engineers, that the locomotive could not be expected to gain great speed, to ascend a moderate incline, or to draw a heavy load, unless the wheels were provided with a cogged rim to work on a corresponding rack along the rails. Numerous schemes were made the subject of patents to overcome this imaginary difficulty—a circumstance which gives one a poor opinion of the state of engineering knowledge at the beginning of the 19th century. That locomotives running with smooth wheels on smooth rails, by mere weight and friction, as exemplified by Trevethick, could draw heavy loads up a moderate incline, was at length, in 1811, established as a fact by Mr. Blackett, a coal-proprietor, on the Wylam railway. The means for imparting speed alone remained to be given.

Locomotive power was employed by George Stephenson (q.v.) on the Killingworth railway in 1814, and with such success, that it was afterward applied on the Stockton and Darlington railway, for which the first act of parliament was passed in 1821. In this last undertaking, Stephenson was encouraged by the generous and enlightened aid of Edward Pease, a member of the society of Friends, whose name will always be associated with the history of railway enterprise. The Stockton and Darlington was the first railway in which carriages traveled with passengers; yet, even with the measure of success so secured, the locomotive was still an imperfect machine, for its rate of progress continued to be little faster than the walk of a horse. Acceleration was now the grand desideratum, and it was attained by using a very simple contrivance—that of sending the waste steam up the chimney, so as to cause a powerful draught in the fire; a rapid generation of steam was the consequence, and by this appliance, along with the multitubular boiler, the machine shot forward with an energy hitherto unknown (see STEAM-ENGINE).

It certainly seems very strange that, notwithstanding the proved feasibility of railways, the public at large could not be stimulated to give any heed to the subject. It was shown in this, as in the analogous case of steam-boats, that the world may remain skeptical of an invention long after it has been practically established beyond cavil. The idea of extending railways over the kingdom for general traffic was perhaps first conceived by Thomas Gray of Nottingham, who, full of enthusiasm, besieged the public, and memorialized the government on this his favorite project, between 1820 and 1824. A work embodying his views, *Observations on a General Iron Railway, etc.*, was published in 1820. Gray's ardent notions met with little favor. Unfortunately, he was no mechanic, and, seemingly unacquainted with the advances which had been made, labored under the old exploded belief, that locomotives must have cogged wheels. After Gray, there appeared another projector, William James of London, who, in 1822, endeavored, without success, to establish a railway between Liverpool and Manchester. Opposition caused his plans to be laid aside. The next and more fortunate projector was Joseph Sanders of Liverpool. He issued the prospectus of a railway from Liverpool to Manchester, Oct. 29, 1824; and this line, surveyed by Stephenson, was, after much unworthy opposition, and some changes of route, sanctioned by the legislature. It was formally opened for traffic, Sept. 15, 1825. Provided with some of George Stephenson's improved locomotives, the success of the line was immediate and complete—in fact, the great railway system was inaugurated.

Now, properly speaking, began that course of commercial enterprise, unregulated, and often wasteful, which has since assumed such importance. Refraining from all control over railway operations, the government left speculators to carry lines anywhere or anyhow, that parliament could be persuaded to sanction. The result, as is well known, has been in many places a complication of competing lines on no principle of economy or enlightened foresight. Abandoned, as it were, to the audacity of promoters, and the mere brute force of capital, schemes, good, bad, and indifferent, had to fight their way at a cost almost exceeding belief; while at the same time there has been much waste

of money in allowing circuitous lines to places which are afterward, in a great measure, superseded by others more direct.

LEGISLATION AND MANAGEMENT.—In the United Kingdom railways are the property of independent companies, who construct and work them under the provisions of acts of parliament. The first step consists in organizing a company. Generally a solicitor and a few active projectors draw up a prospectus, call meetings, suggest the names of directors, and appoint an engineer to make a survey. In no case does government or any public body take any part in the initiatory proceedings, or find any part of the capital. By the engineer and solicitor there is much to be done at the outset. Having procured a copy of the survey, the solicitor has to discover the name of every proprietor whose land is interfered with, as well as every tenant or occupant; all which names, with the extent and nature of the land to be taken, are entered in a roll, called the *Book of Reference*; and, with every person so concerned, a schedule must be lodged, stating all particulars. The recipients of the schedules are requested to state in reply, whether they design to assent, to oppose, or to remain neuter; by which means the mind of every one territorially interested becomes known to the promoters. Land to be taken for, or damaged by, railways is valued under different categories: 1. The quantity and quality at so much per acre; 2. The injury caused by cutting off one part of a field from another, called intersectional or severance damages; and 3. The damage done to the amenity or beauty of the place. Besides claiming compensation on these different grounds, the proprietor demands, for the sake of convenient communication, that bridges or level crossings shall be made across the line, or that passages be left beneath it; also that all ordinary means of drainage be maintained by culverts. Sometimes he stipulates for a siding or station. Should the lands be let to a farmer, as is very generally the case, he is treated with separately for the loss he is likely to sustain during his lease, including any loss by unexhausted manure in the lands appropriated. Being thus compensated for his claims, the farmer continues to pay his rent as usual without deduction, according to the obligations of his lease, and any question is saved between landlord and tenant. Such is an outline of the usual method of settling "land-claims," though much depends on the feeling on both sides. At one time enormous sums were asked and paid for alleged damage to land; now, the claims are more moderate, and in few instances is damage to amenity an element of consideration.

Until a statutory enactment is procured, the shares of a company are in that embryo state called *scrip*. Allotted to applicants by the provisional directors, the shares are "taken up" by paying a small instalment of from 5s. to 20s. per share. These preliminary sums are paid into a specified bank, the receipt of which is the scrip or certificate that so frequently becomes the subject of eager transfer among jobbers. The bank deposits of the allottees constitute the fund from which are paid—1. Expense of survey; 2. Expense of advertisements, prospectuses, etc.; 3. Parliamentary expenses; and 4. The amount to be lodged with an officer of government as a guarantee that parliament shall not be troubled with a merely pretended scheme. Should the bill not pass, the sum last mentioned is returned, and is, along with any residue, divided *pro rata* among the holders of scrip. Should the bill become law, scrip-holders are required to present their names with the amount of their respective shares for register at the office of the secretary of the company. "Calls" are next made on the shareholders. If the shares be £10, a call of £2 10s. per share, at intervals of three months till the whole is paid, is customary. Any failure to pay calls by a prescribed day incurs the risk of forfeiture. In authorizing a company, parliament gives power to raise so much money by shares, and so much by borrowing. The amount that may be borrowed is equal to a third of the stock, but it cannot be legally borrowed until all the shares have been issued, and at least one-half of all the shares has been paid up. The lender has a mortgage over the whole property of the company, called a debenture (q.v.). The entire amount paid for shares and borrowed on mortgage forms the "capital account" of the company. See CAPITAL ACCOUNT, in which an explanation is offered of the manner of disbursing from capital and also from revenue; it being from revenue alone that dividends can be legally paid.

The act which authorizes the undertaking constitutes the company a corporation, the members of which are responsible only to the extent of their respective shares. In the act, the names of the first directors are given; it is also stated who are first to retire, and how elections are to be conducted. A director must possess a prescribed amount of stock. The directors are empowered to appoint from their number a chairman and deputy-chairman. They likewise have the appointment of secretary, traffic-managers, and other paid officials. The directors themselves profess to give their services without any species of remuneration; but the shareholders usually vote a small sum to be put at their disposal, adequate to meet absolutely necessary expenses. Where the duties are very onerous, a special allowance per annum is voted to the chairman. It is likewise customary for the directors to have free passes over the line, which privilege is also enjoyed by the secretary and some other officials. In some instances, a free pass for a day is given to the shareholders to enable them to attend the stated half-yearly or special meetings. The principal business at the half-yearly meetings is the reading and approval of the "report" of the directors. As the report is always printed and circulated previously, all are prepared to discuss its merits.

The organization of the present railway system has not depended on the private acts authorizing the several undertakings. There is now a body of general railway law,

springing from a number of public acts, which have from time to time received the grave consideration of the legislature. These statutes date from 1838 onwards; some of the more important were passed in 1845; among these were several comprehensive statutes, including "The Companies Clauses Consolidation Act," and "The Companies Clauses Consolidation (Scotland) Act;" also "Railway and Lands Clauses Consolidation Act;" to which supplementary acts were added in 1863 (see Bigg's *General Railway Acts*). Among the diversity of matters treated of are as follows—obligations as to carrying mails, and conveyance of troops and police; regulations as to gates at level crossings, signals, and junctions; penalties for obstructing engines or railway officers, and trespassing on lines; limitations of gradients and curves; gauge; time within which railway must be made; notices to be given to board of trade before line can be opened, and not to be opened without authority, after due examination of works; returns to board of trade as to accidents; maintaining of fences; making of sidings for farming and other purposes; one cheap train to be run each way daily; rules for registering and transferring shares; voting according to ratio of shares held; payment of poor-rates and public assessments; leasing of lines; agreements to work lines; surrender of shares; authority to buy, hire, and use steam-vessels; etc.

Besides these public acts, there is a code of regulations as regards the mode of commencing and carrying railway bills through the houses of parliament. This code, embodied in a work issued annually, is styled *Standing Orders of the Lords and Commons relative to Private Bills* (1 vol. 12mo, issued by Waterlow and Sons, Westminster). With this, all parties engaged in procuring railway acts require to be well acquainted, for neglect of any of the prescribed forms is almost certain to be fatal. We give the following as specimens of "standing orders": Notices of applications for acts to be advertised in October or November; plans, sections, and books of reference to be lodged with the clerk of the peace or sheriff-clerk of county for public inspection, on or before Nov. 30 [often an immense struggle up till last moment to get this done]; petitions for act stating particulars to be lodged at the private bill office of the house of commons on or before Dec. 23; on or before same date, copy of proposed bill to be lodged with board of trade; on or before Dec. 31, declarations, lists of owners, lessees, and occupiers, also estimate of expense, to be deposited in private bill office; a sum not less than eight per cent of the estimated expense to be deposited with the court of chancery, England, an officer of the court of exchequer, Scotland, or court of chancery, Ireland, previous to Jan. 15; examination of petitions to commence on Jan. 18; if promoters do not appear after a notice of seven clear days, examiners may throw out petition; certification by examiners whether standing orders have been complied with; bill submitted to select committee; proceedings in opposed bills; report of board of trade on bill; report of board of admiralty on bill, should any tidal or navigable river be proposed to be interfered with; preamble of bill proved or otherwise; bill to give power for future revision by parliament, etc. There are equally explicit standing orders as regards the house of lords, whose chairman of committees subjects all private bills to a sifting examination. Whatever, therefore, may have been the negligence of the government at the outset, railway legislation has latterly received a painful degree of attention. As marking a desire for simplifying procedure and lessening expenses, parliament passed an act, 1864, giving the board of trade power to authorize bills for a smaller class of railways, provided they were unopposed—a concession which may promote a minor but useful kind of branch-lines.

In issuing the prospectus of a railway, an estimate is given of the probable amount of traffic of all kinds; but in every case, sometimes to a surprising degree, the traffic exceeds expectation. Railways have not improperly been compared to navigable rivers. To inland and not easily-reached towns they impart the character of a seaport placed in ready communication with all the world. The exciting of a desire to travel and the developing of local trade and resources, accordingly attend on railway undertakings, and the consequence is a universal activity and prosperity, and the creation of wealthy industrial centers.

Railways were at first detached undertakings between one large town and another, but now many of the companies have for mutual advantage amalgamated in groups; and in a number of cases, for economy in working, lesser lines have been leased to companies of larger means. In this, as in most other commercial concerns in Great Britain, the tendency is to concentrate business in the hands of monopolists possessing large capital, or at least those having a great capacity and disposition to borrow. One of the advantageous results of a union of railway interests is, that passengers are able to procure "through-tickets" to carry them forward for hundreds of miles without delay or change of carriage; but it is not less conspicuous that the "railway interest" has become a formidable power in the state, and is able to carry lines almost anywhere, in disregard of land-proprietors or town-authorities, as if the destruction of rural amenity and the wholesale ruin of dwellings were matters of perfect indifference. Making every allowance, therefore, for the high social value of the railway system, it has certainly reached a point of despotic overbearance that requires some species of control more effectual than that which is embraced in the irregular action of parliamentary committees or of the board of trade.

This question has lately been attracting much attention. The government has tried

In various ways to ameliorate the evils arising from its early apathy, and to control the excesses of railway enterprise. The latest of these efforts was the appointment of a joint committee of lords and commons, and a bill based on the report of that committee was in 1874 before parliament. One of the conclusions arrived at by this committee is worth noting: "That no means have yet been devised by which competition can be maintained. Nor is there any reason to suppose that the progress of combination will cease until Great Britain is divided between a small number of great companies."

Two great propositions for amalgamation made recently have been negated by parliament. It remains to be seen whether the act will prove more successful than antecedent legislation. Its principal feature is the appointment of a mixed tribunal—composed of three eminent men—for the regulation and control of the working of railways.

The only alternative proposed to the present system is the government purchase of railways. An act of parliament was passed in 1844 for the purpose of enabling government to purchase all lines after they had respectively been 21 years in existence, dating from the passing of the act. This statute came into operation in 1865, but the joint committee of 1872 report that they do not think the terms of the 1844 act suited to the present condition of railway property, or ever likely to be adopted by parliament.

There is much to be said on both sides of this question: most of the arguments advanced *pro* and *con* may be found in articles respectively in the *Quarterly Review* and *British Quarterly Review*, April, 1873.

CONSTRUCTION.—Railways in the United Kingdom are of two kinds—double and single. The double consists of two lines of rails—an *up*-line, conducting toward, and a *down*-line, leading from the metropolis or principal center of traffic. By far the larger number of lines are of this double variety. Single lines, with places where trains may pass each other, are mostly of recent construction, and have received their chief development in Scotland. On some of the main lines to London it has been found necessary to add a third, and in some cases a fourth line to accommodate the enormously increased traffic. Whether double or single, all the lines are inclosed. At the chief terminus there is a group of buildings for offices, workshops, sheds for locomotives, etc. Within late years the terminal stations at the larger towns have assumed vast proportions, and in them comfortable waiting and refreshment rooms are provided. In many cases, also, hotels on a very large scale have been erected as part of the buildings at the termini.

The construction of a railway is the business of contractors, who execute the works by estimate, according to the plans and specifications of the engineers. A railway contractor is a capitalist with a practical knowledge of earth-digging, blasting rocks, pumping, embanking, boring and building tunnels, erecting bridges, and other rough operations. He possesses a stock of the various necessary apparatus, light rails, tools, etc., including horses, wagons, and locomotives for dragging materials. He has subordinates called time-keepers, foremen, gangers, and under-gangers, placed over detachments of operatives. These operatives are a remarkable class of men. Originally from Lincolnshire and Lancashire, they are popularly known as *navvies* (contracted from "navigators"), from having been engaged in excavating navigable canals. Navvies sometimes labor in bands called *butty-gangs*, by piece-work, and are known to draw large sums, but more generally they are employed at days' wages.

Signals.—The signaling arrangements form an important part of railway construction. The most common form of signal is the semaphore, and at night, colored lights. A red light signifies danger; a green, caution; and a plain light, that the line is clear. Much care is given to the arrangement and construction of crossings, junctions, etc., with their numerous *switches*, or movable rails, used for changing the direction of a train from one line to another. The *switches* are generally worked directly from the signal-stations, and are so arranged that their points shall *not* face toward the advancing traffic. Numerous accidents have been caused by "facing points." Many improvements have been lately introduced in signaling, crossings, etc., all with a view to increased safety. The "block" system has been adopted by the principal railway companies, particularly in the neighborhood of busy centers of traffic. Under this system each signal-station is in direct telegraphic communication with the nearest signal-stations, both up and down the line, and a train is not allowed to pass any signal-station until the train immediately preceding it has started from the next station in advance. Thus the driver may push on without hesitation from point to point; and thereby the traffic is expedited, and at the same time safety increased. The system of *interlocking* has also been extensively introduced. Under this system the pointsman can *only lower one* signal—namely, that which corresponds to the line which, from the position of the switches, is *clear*; and before he can alter the position of the switches he is compelled to return this signal to "danger."

Curves and Gradients.—Engineers endeavor to render their lines as level and straight as possible, but circumstances often necessitate the use of considerable curves and gradients. As a general rule there are few curves of less than three-eighths of a mile, or 30 chains' radius; when they are employed, the exterior rail is super-elevated, to counteract the centrifugal force, otherwise a quickly moving train might leave the rails. Gradients being expensive to work according to their degree of inclination, few are more steep than 1 in 60, though 1 in 30 is not unknown. On steep gradients, stationary engines were sometimes employed, but in nearly every case these have been abandoned for locomotive power. On local and private lines, much steeper gradients and sharper curves are

common. One of the earliest, if not the first trial of a locomotive on an incline of 1 in 12, was made in Scotland in 1862, by Mr. George Gray, on his private line near Bathgate.

Gauge and Earth-works.—In the early stage of railway operations, the gauge or width between the rails excited considerable discussion. When way-leaves, or tramways, were introduced in the coal districts, their gauge was adapted to the common road-wagons that were to be put upon them, and it happened that the gauge between the wheels of these wagons was 4 ft. 8½ inches. Accustomed to this width, George Stephenson believed that it "was most economical in construction, not only as regarded the engines and carriages, but more particularly of the railway itself." This gauge was accordingly adopted on most of the earlier-made railways, and, notwithstanding the keen contests of engineers, who were generally favorable to a 5 ft. or 5 ft. 3 in. gauge—Brunel contending for 7 ft.—this original 4 ft. 8½ in. gauge—measured from the inside of one rail to the inside of the other—was irrevocably fixed by a public act, 1846, as applicable to all the railways in England and Scotland, the Great Western and certain branches excepted, on which the gauge was regulated at 7 feet. Owing to inconvenience in communicating with other lines, and from other causes, the Great Western has found it advisable to conform to its neighbors, and has now relaid its lines on the standard gauge. By the same act, the gauge in Ireland was fixed at 5 ft. 3 inches. The government of India fixed the gauge of all the railways in that country at 5 ft. 6 inches. But a movement in an opposite direction has set in within the last few years, and the battle of the gauges is renewed. A horse tramway at Festiniog in Wales, constructed in 1832 for the conveyance of slates from a quarry, and laid with a 1 ft. 11¼ in. gauge, was, in 1863, transformed into a locomotive railway for passengers and goods, and was found to work with perfect safety, and with remarkable economy. The success of this experiment has awakened the attention of many engineers to what they believe to be the needless extravagance of the standard gauge; and railways with gauges varying from 2 ft. 6 in. to 3 ft. 6 in. are now in operation in the Isle of Man, Norway, Sweden, Russia, Queensland, Peru, Chili, Brazil, Canada, and the United States, where a vast mileage is built or in course of construction. The great argument for the narrower gauge is the obvious economy both in first cost and in working. It is calculated that, on an average, companies have to haul over their lines seven tons of dead-weight in order to carry one ton of goods; and in the case of passenger carriages the excess is even greater. With the whole apparatus on a smaller scale, this waste is greatly reduced. Another advantage of the narrow gauge is, that much sharper curves may be adopted than are possible on the broader one, and thus the route may be chosen to much greater advantage. While it may be an open question whether the narrow gauge is adequate for a thickly peopled district, where "express" trains may be indispensable, and where traffic may at times be exceptionally heavy, it is, without doubt, especially suitable for sparsely peopled districts and half-developed territories. Indeed, it affords the means of supplying the benefits of railway communication where otherwise they would be hopeless. After careful investigation, the Indian government of the late Lord Mayo decided to adopt the meter gauge, about 3 ft. 3 in., for the greater part of an extensive series—1500 m.—of state railways, and considerable progress has already been made in their construction. In Canada there are already 5,230 m. of narrow-gauge railway.

Ballast.—This is the name given to the mass of broken stones or dry gravel on which the sleepers are placed, and which serves to keep them steady. Material for ballast is generally got in the cuttings or near the line, but is often brought a considerable distance. The term *ballast* originated in the practice of using the gravel-ballast emptied from the ships in the Tyne, for the tram and railways in the neighborhood of Newcastle.

Rails.—Rails are generally of wrought iron, but steel rails have been extensively adopted where there is a continuous heavy traffic, and are found to reduce greatly the cost of maintenance, and promise to supersede wrought iron. Rails differ in shape and weight. The most common form is the "double-headed" rail, which is reversible. Another form, which was once used on the Great Western for the broad-gauge line, is known as the "bridge-rail;" and a form frequently used on the continent, and generally on narrow-gauge lines, has a flat base formed by a flange on each side of the vertical web. The last two descriptions do not require *chairs*, but are fastened directly to the sleepers by spikes. Rails are generally 21 or 24 ft. long, and for light railways vary in weight from 20 to 45 lbs., and for heavy lines from 60 to 80 lbs. per lineal yard. Cross-sleepers are laid at 2 ft. 6 in. apart, usually about 3 ft., and on these sleepers the *chairs* of cast-iron are fixed and held firmly down by iron spikes driven into the sleepers. The ends of the rails are now almost always joined together by a plate of malleable iron placed on each side, called a fish-plate; two of these are used at each joint, and are bolted together by strong bolts passing through the rails. In the joining of the rails end to end, to make a smooth surface, great care is bestowed; perfect steadiness in the required line of direction is secured by means of wooden wedges acting on the rails and the chairs.

Hitherto, the sleepers have been of seasoned native larch, as the most durable; but latterly, from the growing scarcity and cost of this article, sleepers have been made of imported timber from ports in the Baltic. They are sometimes *crossed* to render them durable, but generally they are found to require renewal on account of splitting before they rot. Many patents have been taken out for methods of dispensing with wood

sleepers, and substituting some more lasting material. Some of them are extensively used abroad, but they are scarcely to be found in this country.

Tunnels and Viaducts.—Tunnels are avoided as far as possible on account of their costliness. They are made only when the excavations would be more than 60 ft. in depth, or when land-proprietors force their adoption, in order to spare the amenity of grounds near a mansion. For this latter reason, some short tunnels are known to have cost railway companies as much as £50,000. Latterly, the execution of underground railways in the metropolis has offered examples of tunneling more extensive than were previously known in England, and at the same time popularized a method of subterranean transit almost as marvelous as anything in the way of viaducts. The Woodhead tunnel is probably the longest in Britain, being 3 m. 60 feet. All our tunnels have, however, been cast into the shade by that through the Alps near Mont Cenis. The highest summit of the section immediately over this tunnel is 9,527 ft., and the summit-level of the tunnel, 4,246 ft.—about the height of Ben Nevis—above the level of the sea. It was completed in 13 years, cost about £200 per linear yard, the total length being 7.6 m., and was opened Dec. 26, 1870. The time occupied in passing through the tunnel by train is 25 minutes. A still greater undertaking, the St. Gothard tunnel, was begun in 1872. Its length is 9.2 English m.; the cost by estimate is £2,000,000; and 8 years was the time specified for completing the work.

Viaducts are frequently of stone, and of handsome architecture, but now commonly of malleable iron girders, of various forms, set in stone or iron piers. In the construction of viaducts, there is a growing boldness of conception. Remarkable works of this kind are the great suspension East river bridge connecting New York and Brooklyn, more than a mile long, the central opening having a span of nearly 1600 ft.; and the St. Louis bridge, crossing the Mississippi by 3 arches, the center span being 520 feet. But the longest bridge in the world at present is that across the Firth of Tay, Dundee, opened May 31, 1878. It was designed by sir T. Bouch, and cost £350,000. Length, 16,612 ft., in 85 spans, 11 of them being 245 ft. each. A magnificent suspension railway viaduct crossing the Forth at Queensferry is now in progress. The contracts for its erection amount to £1,116,000.

Cost of Permanent Way.—Owing to the obstruction offered by land-owners, and their excessive claims for amenity damages, also the opposition of rival companies, the cost of railways was at one time very much greater than it is at present. The expenditure incurred in securing legislative authority to construct railways was likewise enormous. The parliamentary costs of the Brighton railway average £4,806 per m.; of the Manchester and Birmingham, £5,190 per m.; and of the Blackwall, £14,414 per mile! The cost of carrying the Liverpool and Manchester line was £27,000. It has been shown that the solicitor's bill for the South-eastern railway contained 10,000 folios, and amounted to £240,000. These few facts, however, afford but a feeble idea of the reckless wastefulness of capital on railway undertakings; it is universally allowed that, under a better policy, not only a much better railway-system might have been provided, but a saving effected of at least fifty millions. At the end of 1871, the total average cost of all the railways in the kingdom was £35,943 per m. open, or about double that of any other country.

The cost of construction varies so much, that it is impossible to say definitely what would be the average cost nowadays; but in England a double line, including station-houses, signals, and all other fixed plant, would probably cost, under ordinary circumstances, from £15,000 to £20,000 per mile. Single lines are made at perhaps a fourth less, but nowhere in the United Kingdom have they been executed so economically as in Scotland. There, some single lines have cost for land and everything not more than about £5,000 per m.—such economy, however, being greatly due to the fact, that the undertakings were promoted and watched over by bodies of land proprietors deeply interested in restraining expenditure. Of these cheap Scotch lines a good example is offered by the Peebles railway (practically a branch of the North British), extending to 18½ m., the entire cost of which, and land station-houses included, was about £95,000. The cost of rolling stock was additional.

Maintenance of Way.—Every railway, great or small, is at a considerable expense in keeping the line in proper working order, for which purpose a staff of officials is required. Besides a general superintendent there is an effective staff of "plate-layers," whose duty it is to watch over and repair the permanent way.

ROLLING-STOCK.—Under this head are comprehended locomotives, carriages, and trucks for goods and minerals, the whole forming an important part of railway undertakings.

Locomotives.—Locomotives are of several kinds, varied in construction to suit the traffic for which they are designed. They may be classed as express, ordinary, passenger, goods, and tank engines. In the latter class the tender for fuel and water forms an extension of the locomotive; but for the most part the tender is detached, and only connected by couplings. Locomotives for ordinary traffic have generally six wheels. In the first two classes, where speed is the principal object, only two, or at most four of the six wheels are *driven*, and these are made of large diameter. There has been a continual tendency to increase the speed, and this has led to an increase in the size of the driving-wheels, which are in some cases 8 ft. in diameter. All the wheels of locomotives for

heavy traffic are coupled together, so as to utilize the entire weight for adhesion. The smaller class of locomotives have only four wheels. The present price of first-class locomotives—of the largest size in general use—including the tender, varies from £3,000 to £4,000. Locomotives of this class weigh in trim from 30 to 40 tons; but there are, of course, much lighter locomotives; while sometimes they are as much as 55 or 56 tons.

Carriages.—There are three distinct kinds of carriages to suit the several classes of passengers. Each first-class carriage consists of three or four distinct compartments; but in the other classes the backs of the seats are in many cases not carried to the roof, leaving the upper part of the carriage open fore and aft. At night the carriages are lighted with lamps; on the metropolitan lines gas is sometimes used. Special saloon-carriages are reserved for royalty. The first-class compartments are handsomely fitted up, and in winter are heated by hot-water tins. Recently, one of the leading companies abolished its second-class carriages; and some companies now run third-class carriages with all trains. Passenger carriages made of iron have been used in America. Sleeping-carriages and the American Pullman cars have also been introduced into this country. Many efforts have been made to devise some simple and efficient contrivance by which passengers might, in cases of emergency, summon the guard, but no plan has as yet been adopted to any extent. The "continuous brake" is an improvement and novelty which has already been successfully tried, and is likely to be soon generally applied. By its use trains can be stopped in a much shorter time and distance than under the present system, and thus the risk of accident is reduced; brakes are fitted to each carriage, and all are simultaneously applied. The guard's van contains space for luggage, and is provided with a look-out box, from which the guard can see along the roofs of all the carriages in the train.

Wagons and Luggage Vans.—To accommodate its traffic, every railway must be provided with a large stock of trucks or wagons for carrying goods, minerals, cattle, timber, and other articles. Except for the heaviest traffic, wagons are now very generally fitted with elastic buffers.

TRAFFIC.—The traffic on railways is of two distinct kinds—passengers and goods; with the goods we include minerals, also timber and other bulky articles. The passenger and goods traffics are placed under separate managements. Usually, there are passenger-trains and goods-trains, but mixed trains are very common on branch lines.

In almost every railway in the United Kingdom, passengers are of three classes—first, second, and third. Though from the fares charged, first-class carriages possess an air of exclusiveness, no more objection is popularly taken to them than to the use of boxes in theaters; and, indeed, they are universally recognized as an advantage, for the reason that by the comparatively high fares exacted for them, the companies are enabled to lower the charges for second and third-class passengers. On some lines, compartments are set apart for ladies if they choose to use them. Special compartments of each class are now also allotted to smokers, a custom one may contrast with the special *non-smoking* carriages common on the continent. The first-class passengers have distinct waiting-rooms at the termini and stations, with generally a waiting-room in addition for ladies; for the second and third class, there is a waiting-room in common. The several waiting-rooms are neatly fitted up, and provided with suitable conveniences, including basins and water for washing the hands—accommodations which contrast favorably with what were furnished to travelers in the old coaching establishments. The waiting-rooms are open all day to the public, and there is seldom any restriction as to going on the platforms. Tickets are sold at a wicket not earlier than a quarter of an hour before the starting of the train. The tickets, marked in consecutive numbers, are stamped with the date on delivery, and, excepting "return-tickets," will not answer for any other day. Return-tickets at a fare and a half are issued on most lines for the date of issue, or from Friday till Monday. On most lines first and second-class untransferable season tickets are issued for various periods at a considerable reduction on ordinary fares. To encourage the building of villas at a distance of 10 to 20 m. from termini, by which means a traffic may be developed, some companies give a personal ticket free for a number of years corresponding to the valued rental of the villa. The second-class has been abolished by the Midland railway.

The number of trains run daily depends on the pleasure of the directors. There are ordinary, mail, and express trains; of this last kind, two usually go each way daily, the fares on which are sometimes higher than by the others. Ordinary fares are about 2½d. per mile first class, 1½d. second class, and 1d. to 1½d. third class; but on some lines the fares are considerably lower. According to one of the provisions of a general act, all companies must run one train daily each way, stopping at all stations, and at a rate of speed not less than 12 m. per hour, at a fare of a penny a mile. Some of the express trains are run at very high speeds, and with wonderful punctuality. On June 1, 1872, London was brought, for the first time, within 9½ hours of Edinburgh, by a train running on the East coast route, which, deducting stoppages, travels at an average speed of nearly 47 m. an hour. By an act, 5 and 6 Vict. cap. 79, there is payable to government "a duty at and after the rate of £5 per £100 upon all sums received or charged for the hire, fare, or conveyance of all passengers." By 7 and 8 Vict. cap. 85, it is enacted that no tax shall be levied on the receipts for passengers conveyed at fares not exceeding one

penny per mile; but by the 26 and 27 Vict. cap. 33, it is enacted that this exemption shall only extend to trains running six days in the week, or on market-days for the conveyance of passengers at one penny per mile. From this passenger-tax Ireland is exempted.

All trains are accompanied by a "guard," who is responsible for their management while running. For the most part, guards are intelligent and obliging, and do all in their power to render service to the passengers. Nor must we omit to say that the porters on duty are remarkable for the trouble they take to carry luggage, find cabs at the termini, and to answer civilly such inquiries as may be put to them by strangers. It may be said with perfect justice, that in no department of affairs in Great Britain is there seen such readiness to oblige as in that connected with railways. Considering the vast number of servants on some lines—the total on all lines is probably about 300,000—the general good conduct that is shown, and the few accidents that occur, constitute a gratifying social phenomenon.

According to English routine, passengers are allowed to find their way promiscuously to the proper carriages, the only check being a call by the guard to "show tickets" previous to starting. All passengers are expected to see their luggage labeled for the place of destination, and to point out what belongs to them on arrival. This is a loose practice, often remonstrated against, but it suits the temperament and self-relying habits of the people. Amidst the crush of traffic, and with little time to spare, the formalities of the continental system would be unendurable. Should labeled packages, resigned to the porters and guard, be lost, recourse lies against the company. Another peculiarity of railway traveling in Great Britain consists in the privacy secured to passengers while on their journey. Instead of being intruded on, as in the American and continental railways, by the constant perambulation of the guard through the train, they are left unmolested to read, talk, or sleep, according as fancy may direct. This very seclusion, however, is thought to be attended with a disadvantage—namely, that passengers are unable to call for the assistance of the guard in cases of threatened outrage by one of their number. To all the numerous devices for summoning the guard, and, if need be, stopping the train, there is unfortunately the grave objection, that if passengers were enabled to call the guard at pleasure, they would frequently do so for no sufficient reason, as whim or imaginary fear prompted; and also, that the unexpected stoppage of trains would seriously derange the keeping of time, and in many lines jeopardize the safety of the whole of the passengers. Seemingly, it would be difficult to fall upon any plan free of this species of objection, unless recourse be had to the American construction of carriages, and the free perambulation of the guard through the trains—a remedy which involves a revolution in English railway transit, as well as in English feelings and manners.

To enable companies to reckon easily with each other as regards intercommunication of traffic in passengers, goods, use of carriages, etc., an institution called the clearing-house has been established in London, to which tickets are transmitted for cross-reckoning and settlement. There is a similar establishment in Dublin. See CLEARING-HOUSE.

Cost of Working.—The cost of working railways, including general expenditure, in Great Britain amounts to from 48 to 50 per cent of the returns from traffic. The remainder forms the divisible profit to pay—1st, the interest on debentures; and 2d, the dividend to shareholders. Of these shareholders, some, as defined by statute, have a preference claim of 5 per cent per annum, what is left over being divisible among the ordinary or original shareholders. In the general expenditure of railway companies is included the outlay for passenger-tax, also police, poor, and parish rates. Besides supporting the poor, the railways in Scotland are rated like heritors (q.v.) for building new parish churches.

According to a return made by railway companies to the board of trade for 1871, the cost of running trains was on an average of 30.33d. per mile, or say about £13 for 100 miles. Lowness of fares can only be secured by a large and well-sustained traffic; and the main reason why fares are much higher than they seemingly might be, is the frequent insufficiency of the number of passengers compared with the accommodation provided for them. A striking exemplification of the possibility of conveying large numbers at very low fares is afforded in the case of "excursion trains," in which sometimes 1000 individuals are taken 50 or more miles and brought back the same day for one or two shillings each.

STATISTICS.—A return issued by the board of trade to the house of commons gives the following statistics for the United Kingdom for the year 1876: Number of miles open, double lines, 9,169; single lines, 7,703—total, 16,872. Number of passengers (exclusive of holders of season and periodical tickets), first class, 44,859,066; second class, 66,478,195; third class, 426,950,034—total, 538,287,295. Minerals carried, 123,044,583 tons; general merchandise, 82,920,481. The traffic under all these heads has been more than doubled within 10 years. Miles traveled by passenger-trains, 105,918,921; by goods-trains, 106,139,327—total, 215,711,739; equal to near 9,000 times the circumference of the world; or 420 *double-journeys* to the moon, and much more than a double journey to the sun. Receipts from passengers, £23,057,731. Receipts for excess luggage parcels, carriages, horses, dogs, etc., £2,418,057; receipts for carrying mails,

£684,533. Total receipts from passenger-trains, £26,163,551; an increase of fully 64 per cent in 10 years. Receipts for live stock, £1,230,948; for minerals, £13,526,213; general merchandise, £18,985,090—total of goods-traffic, £33,754,317; an increase of fully 93 per cent in 10 years. Total receipts from all services, £62,215,775. Working expenses including maintenance of way, locomotive power, repairs and renewals of carriages and wagons, etc., £33,535,509; net balance of receipts over working expenditure, £28,680,266. Proportion of expenditure to receipts, 54 per cent. Vehicles of all sorts employed, 464,527. The traffic receipts per m. of line open amounted to £3,551, and per m. traveled by train, to 5s. 6½d.; in 1872, the figures were £3,244, 5s. 4½d., and in 1854, £2,510, 5s. 6½d. respectively. The receipts per train mile were highest in 1856, 5s. 11½d.; and lowest in 1870, 5s. 1¼d.

The authorized capital by shares was £540,095,705; by loans, £192,706,822—total, £741,802,527. Total paid up on shares and debenture loans, £658,214,776. The proportion of paid-up capital to total length of line open was £39,012 per m., the highest proportion yet reached, having risen gradually from 1863, which was the lowest, viz., £32,804 per mile. Of the total capital, about 45 millions received no dividend at all; the highest dividend received was 13 per cent; but the greater part received from 4 to 5 per cent. For the first time since 1858, the returns for 1878 showed a falling off of 0.31 per cent in traffic. At the same date, the amount of authorized capital in shares and loans was £778,872,572; of paid-up capital, £698,545,154; the length of single and double lines, 17,333 m.; gross receipts, £60,454,375; per m. of line open, £3,488; per train mile, 5s. 5¼d. The number of third-class passengers had increased 4 per cent; while there had been a decrease of first and second.

Accidents.—During the six months ending June 30, 1879, the number of railway accidents (collisions, running off lines, breaking of axles, etc.) in the United Kingdom was over 200—Passengers killed, 34; passengers injured, 442; number of servants of companies, trespassers, etc., killed, 370; injured, 955—total, killed, 404; injured, 1397. A large proportion of the accidents to passengers were due to causes within the control of the sufferers. The number reported killed in 1878 was 1053, and injured, 4,007; the list of casualties in 1876 was considerably larger, including 1245 killed and 4,724 injured.

FOREIGN RAILWAYS.—The first continental country that availed itself of railway locomotion was the small kingdom of Belgium, where a number of lines in connection with each other were constructed between 1834 and 1836, and in about ten years afterward the group was nearly completed in a well-devised and comprehensive scheme. From Belgium railways spread to France, where they were laid down on a plan prescribed by the government, which offered special encouragement to capitalists. The method adopted was to give the land and make the bridges; but, besides these heavy items of expenditure, the government was in a number of instances at the cost of the entire permanent way. So far favored, the promoters, who formed a company, had only to find capital to work and maintain the line. The government, however, relinquished the property only on the footing of a lease for such a number of years as a company was disposed to be satisfied with. Tenders were ordinarily taken from competing bodies of promoters; in this manner the concession, or right of tenancy, has been adjusted at from 50 to 99 years; at the end of the prescribed periods the lines will fall into the hands of the government. Lately, the French system has outgrown this kind of tutelage; and there is a disposition in companies to act on an independent footing; the state, however, has secured a very general right of property in the existing lines, whether by the method of assistance originally fallen upon, or by giving large subventions of money, on the plan of receiving a share of profits after a certain dividend has been reached. By means of these subventions, as well as a species of guaranteed monopoly of traffic, the profits to shareholders in some French lines reach from 10 to 12 per cent. Within 99 years from 1852, a large proportion of the French railways will lapse into possession of the state. On one or other of the various plans of government helping companies, and preventing ruinous competition, nearly the whole railway system of continental Europe, Asia, and Africa is established; and in a large number of the foreign railway undertakings everywhere much British capital is invested. The principal continental railways, particularly in France and Belgium, are double lines, and under good management; but the rate of transit is generally slower than in England, and the formalities as to taking tickets and being allowed to enter the trains are exceedingly troublesome.

Various continental lines have been constructed by English contractors, who employed English navvies for the purpose. In Italy, however, as lately as 1862, we observed that the work of construction was performed in a tedious and laborious manner by women and girls, who carried the earth in baskets on their heads, under the superintendence of task-masters with whips—a sorrowful spectacle, and the more surprising as being in a country noted for its advancement in practical engineering.

In Canada, Nova Scotia, and Australia, railways have been successfully established; but in no British dependency has the railway system been latterly pushed forward with such activity or likelihood of advantage as in India, where, at the end of 1874, 6,273 m. were open for traffic; and at the beginning of 1878, 7,324 miles. The undertakings have been materially assisted by government, by giving the land to the companies, by subventions in proportion to the actual outlay, and in some instances by guaranties of a minimum dividend of 5 per cent to shareholders. Railways have likewise been introduced

into China and Japan. A line from Shanghai to Woosung, in China, was opened in 1876 (unhappily closed again); and Japan, in 1878, possessed 66½ m. of railway, with 142 m. in construction, and 455 m. sanctioned by government.

Railways in the United States date from 1830, when a short line was made in Massachusetts. All the American lines are constructed and worked by private companies, but in other respects they differ materially from similar undertakings in England. A few peculiarities of the American routine may be noted. The cost of procuring legislative authority to make the lines has usually been very small; the lines are mostly single, and the land for them has often been either given for nothing, or for a comparatively trifling consideration; the lines have generally no fences, and they go through populous towns along the open streets without restriction or fear of the consequences; the only care taken against accidents is for the driver to ring a bell, and it is usual to put up boards with the inscription: "Look out for the locomotive when the bell rings." Tickets are sold by the guard or at offices throughout a town without fixing a date, just as ordinary articles are sold at a shop; the waiting-rooms are generally of a poor description; as regards passengers, nearly all varieties travel in one class of carriage; and lastly, there is a marked deficiency of porters, station-keepers, and other officials, either to give information or render assistance to passengers. We may add that the trains proceed at a comparatively slow rate. The whole organization and management is, in fact, on a loose footing, though perhaps well adapted to the raw condition of a large part of the country. The seats in the "cars," as they are termed, are arranged in rows, with a passage up the middle for the conductor, who, by means of a small platform at each end, can step from carriage to carriage, and perambulate the train at pleasure, which he is constantly doing in the performance of his ticket-selling and ticket-taking duty. The wheels being attached to a swivel or *bogie* framework, the cars can turn round corners with ease, notwithstanding their great length. Altogether, the railway system of the United States can in no shape be brought into comparison with that of the United Kingdom, for the two things are constituted on very different principles. The chief desire in America has been to open up the country at all hazards to railway communication, leaving improvements to be effected afterward by the wealth which that communication is almost certain to create. On the contrary, in Great Britain and Ireland, there has been no pervading aim of this kind; every railway scheme has been legislated for and loaded with expenses as if it were a matter of indifference to the nation whether such projects should be carried out or not; and, as is well known, the comfort and convenience of passengers has, on the whole, at whatever cost, been a matter of primary concern to the companies.

The following particulars, which are almost entirely taken from the *Statesman's Year-Book*, may be found interesting. They show the mileage of railways open for traffic, and the proportion existing between that mileage and the area of the principal countries of the world:

STATES.	LENGTH OF RAILWAYS OPEN FOR TRAFFIC.		One mile of Railway to sq. miles of area in 1876.

The total mileage open over the whole world is now probably about 200,000.

There are several newspapers devoted to railway subjects, issued weekly in London, the oldest of which is that known as *Herapath's Railway Journal*. We cannot close this notice without adverting to the important service rendered to the traveling community in the United Kingdom by *Bradshaw's Railway and Steam-Navigation Guide*, so well known to the public for its comprehensive and carefully constructed time-tables (q. v.). In France, Germany, the United States, and other countries, railway time-tables are now issued, weekly or monthly, on the plan so successfully established by Mr. Bradshaw, whose *Guide*, however, is not excelled for accuracy, cheapness, or the extent of its information.

RAILWAYS (*ante*). The first railroad in the United States was at Quincy, Mass., from the granite quarries to the Neponset river, and it was run by horse-power. As early as 1782, Oliver Evans of Philadelphia patented a steam-wagon. He built a high-pressure engine, placed it on wheels, and it transported itself a mile and a half. This was 20 years before Richard Trevethick had patented his steam-carriage, which was not practically applied on the Merthyr-Tydvil railway until 1804. But it was not until 1829 that a locomotive was actually running in America, and that one, which was exhibited in New York, was built by George Stephenson, the English engineer. The first American engine to be run in the United States was the "Tom Thumb," constructed by Peter Cooper, placed on the Baltimore and Ohio road in 1830. This was too small to be practically serviceable; but in the same year the locomotive "Best Friend" was built by manufacturers in New York from the plans of E. L. Miller, of Charleston, S. C., and was put on the road between that city and the town of Hamburg, being the first working locomotive built in America. The first actual and practical use of a locomotive on an American road was on a railroad built in 1828 by the Delaware and Hudson canal company from their mines to Honesdale, the terminus of the canal, and where a locomotive imported from England, and built at Stourbridge, was running in the summer of 1829. The Baltimore and Ohio railroad was commenced in 1828, and in 1831 carried more than 80,000 passengers and about 6,000 tons of freight. In Aug., 1830, the Mohawk and Hudson railroad, from Albany, N. Y., to Schenectady, was commenced; whose charter, dating 1826, was perhaps the earliest given. It was the first railroad in New York, and began to operate Sept., 1831. The title of this road was afterward changed to the Albany and Schenectady. In 1830 the Baltimore and Susquehanna railroad was commenced; and in the same year, the Baltimore and Ohio, which had been chartered in 1827, was opened between Baltimore and Ellicott's mills. In 1831 a road was built from Manchester, Va., 13 m. up the James river to the coal mines; and in this year there was also constructed a little road, $4\frac{1}{2}$ m. long, connecting lake Pontchartrain with New Orleans. The Boston and Lowell railroad was among the earliest in this country. In 1832 there were 67 railroads in operation in Pennsylvania, and most of the important lines in Massachusetts and New Jersey were commenced in that year. The New York and Erie railroad was commenced in 1836, and completed in 1851 as far as Dunkirk. At the close of the year 1838 there were 1843 m. of railroad in the United States. All the early roads were built on the English gauge of 4 ft. 8 $\frac{1}{2}$ inches. They were constructed by laying wooden or stone cross-ties, to which were pinned longitudinal wooden rails, and upon these rails were fastened with spikes flat bars of iron, $\frac{1}{2}$ and $\frac{3}{8}$ of an in. thick, and 2 $\frac{1}{2}$ to 4 $\frac{1}{2}$ in. wide, the heads of the spikes being counter-sunk in the iron. This method proved dangerous, because the ends of the rails were liable to start, breaking sometimes through the bottom of a car. The building of the New York and Erie railroad may be considered the origin of practical competition between railroads and between cities. Its construction was hastened with a view to divert to New York the traffic which had before gone to Boston from the west, via Albany. The Boston and Albany had completed its through organization by way of the Western railroad (Mass.) and the Albany and West Stockbridge in 1842. In 1848 the railroad mileage of the United States was 6,491; in 1853 it was 27,153. The New York, New Haven and Hartford railroad was formed by the consolidation in 1872 of the New York and New Haven railroad, opened in 1846, and the Hartford and New Haven, opened in 1839. The Pennsylvania railroad was completed in 1854. The Central of New Jersey was formed by a consolidation in 1849, and completed to Jersey City in 1864. The New York Central and Hudson River railroad was formed by a consolidation in 1869 of the N. Y. Central (itself a consolidation in 1853) and the Hudson River railroad. To show, by one method, the progress of certain of the more important roads in the United States from 1869 to 1879, inclusive, the following figures are suggestive. In 1869 the total mileage controlled by the Pennsylvania railroad company was 538; in 1879 it was 4,000. That of the New York Central and Hudson River road was 593 in 1869, and 2,500 in 1879. The Chicago and Northwestern, 1150 in 1869, and 2,158 in 1879. The Chicago, Milwaukee and St. Paul, 830 in 1869; 2,250 in 1879. The mileage operated in 1879 of the principal railroads other than the above was as follows: New York, Lake Erie and Western, 1000 m.; Baltimore and Ohio, 1500; Chicago and Alton, 677; Chicago, Burlington and Quincy, 1709; Chicago, Rock Island and Pacific, 1003; Illinois Central, 1255; Wabash, 678; Michigan Central, 803; Lake Shore and Michigan Southern, 1176; Atchison, Topeka and Santa Fe, 868; St. Louis, Iron Mountain and Southern, 684; Delaware, Lackawanna and Western, 670; Philadelphia and Reading, 799; Atlantic and Great

Western, 512; Central Pacific, 1213; Union Pacific, 1042; Southern Pacific, 1150; Kansas Pacific, 672; Northern Pacific, 646. The 10 years 1869-79 were the most important period in American railroad history, especially in connection with the construction of transcontinental roads, and the opening of the far west and the Pacific coast to settlement and traffic. The completion of the Union and Central Pacific railroads at the beginning of the decade was followed by a stupendous movement which, by 1879, comprehended the following situation:

ROUTES AND CONDITION OF THE VARIOUS PACIFIC RAILROADS IN 1879.

NAME.	ROUTE.	CONDITION.
1. Canadian Pacific.	From a point w. of Ottawa, via the n. coast of Lakes Superior and Winnipeg, crossing the Rocky mountains at Yellowhead pass, and ending at Buz-zard inlet, about lat. 49°.	Several hundred m. under construction, from lake Superior west. The line to be 1750 m. long, and to be completed in 5 years.
2. Northern Pacific.	From Duluth and St. Paul, Minn., w., between the 46th and 48th parallels to Puget sound, a distance of about 1800 miles.	Over 800 m. constructed, and will probably be completed in 3 years.
3. Union and Central Pacific.	From Omaha to San Francisco, 1916 m., starting about lat. 42°, and ending lat. 38°.	Pioneer line, completed 1869.
4. Utah and Northern.	Branch of the Union Pacific (3 ft. gauge), starts from Ogden and runs into Montana. It is designed to extend this road northwesterly to the Columbia river, and compete with the Northern Pacific.	Constructed 210 m. n. from Ogden to Eagle Rock, Idaho.
5. Thirty-fifth parallel route.	This is the St. Louis and San Francisco company from St. Louis to Vinita, Ind. terr., and from Pierce City, Mo., to Wichita, Kan., where it connects with the Atchison, Topeka and Santa Fe, now nearly completed to the Rio Grande at Santa Domingo. At the 35th parallel these companies become owners of the franchises of the Atlantic and Pacific company, and agree to build to the Pacific. The line will have two termini, San Diego and San Francisco.	Constructed 327 m. to Vinita, Ind. terr., 900 m. from Kansas City to the Rio Grande. To be completed in 2 years.
6. Southern Pacific, or 32d parallel.	From San Francisco into Arizona, and to El Paso, New Mexico. Here it will join the Galveston, Harrisburgh and San Antonio, completing a line to Texas and the gulf coast, and uniting with the Texas and Pacific road. The latter will extend e. to Vicksburg, and will unite with the St. Louis, Iron Mountain and Southern for the n. and east.	Open from San Francisco 900 m. into Arizona. Texas Pacific open 253 m. from Texarkana to Fort Worth, besides branches.

The last report of the Atchison, Topeka and Santa Fe, for the year 1880, shows gross earnings, \$8,556,975; operating expenses and taxes, \$4,303,205; leaving—subtracting dividends and other expenses, \$3,272,054—a net surplus of \$941,716. The Atlantic and Pacific has been pushed 100 m. w. from Albuquerque, and during the year 1881 will reach the northern counties of Arizona. The country lying on both banks of the Red River of the North, comprises a fertile belt, 300 m. wide, of rich prairie land, embracing an area of 200,000,000 acres, and promising to become the unrivaled wheat district of the world. This country has been opened by various lines of railroad, now consolidated in the St. Paul (Minn.), Minneapolis and Manitoba railway, and the Northern Pacific. The latter line was chartered in 1864, to construct a railroad and telegraph from lake Superior to Puget sound, a distance of 1800 m., with a branch to Portland, Oregon, about 200 miles. The aggregate grants of land to this road amount to 47,000,000 acres. The failure of Jay Cooke & Co., in 1872, precipitated the great financial panic of that year, and was itself caused by the impracticability at that time of the firm's sustaining the vast financial weight involved in the construction of the Northern Pacific railroad. Notwithstanding this disaster, the road has advanced under new management, and already its line is dotted by settlements containing 65,000 busy inhabitants, with the usual American surroundings of houses, schools, and churches. A quarter of a million acres of land are under cultivation, the sales of land being nearly sufficient to defray the cost of building the road, as this accrues. In June, 1879, the line was in operation from Duluth, on lake Superior, to Bismarck, Dakota, 449 m., with a branch in Washington territory from Kalama, on the Columbia river, to Tacoma, on Puget sound, a distance of 136 m.,

making a total length of road of 583 miles. A n. and s. connection is secured by a 99 years' lease of the line from Brainerd, down the Mississippi, to St. Paul, 136 miles. As connection with Manitoba and the Canada north-west is also opened by the Duluth and Winnipeg route, length 340 m., it will be seen that the vast wheat belt of the north will become united via St. Paul, to the great trunk-line railroad system of the central and eastern portions of the United States. Meanwhile, the entire congeries of roads will connect the three Pacific coast termini—Puget sound, San Francisco, and San Diego; New Orleans and the gulf of Mexico being reached by the Mississippi river, and by n. and s. lines of railroad in progress.

Though the southern states had advanced less rapidly in the construction of railroads up to 1879 than the north and west, they were fairly supplied. In that year there were in Maryland 29 railroads; West Virginia, 11; Virginia, 24; Kentucky, 27; North Carolina, 22; Tennessee, 23; South Carolina, 16; Georgia, 28; Florida, 8; Alabama, 24; Mississippi, 16; Louisiana, 11—in all, 239 distinct lines. In 1879 and 1880 important combinations and consolidations of southern roads were effected, and new roads projected and constructed; the whole tendency being toward the establishment of independent trunk lines from the n.w. to the s. Atlantic seaboard, with a view to lessen the vast preponderance of railroad vitality and influence in the north over the south. The Nashville and Chattanooga, Louisville and Nashville, Central of Georgia, Cincinnati Southern, and other southern roads thus assumed a marked prominence—not alone in the stock-market, but also as newly effective links in the great chain of railroad transportation of the United States. The Cincinnati Southern railway is perhaps the only existing instance of a city building a railway for its own purposes. The city of Cincinnati, Ohio, built this line under the direction of a board of trustees created by an act of the legislature of Ohio, May 4, 1869, construction being begun Dec., 1873. The road is 336 m. in length from Cincinnati to Chattanooga, Tenn.; crosses four navigable rivers—the Ohio, Kentucky, Cumberland, and Tennessee—and includes 27 tunnels and 4 bridges (of which 3 are iron), and has steel rails. By connection with the Alabama Great Southern at Chattanooga, it reaches Vicksburg, New Orleans, and Mobile; and by a branch line (building) to Carrollton, Ga., reaches Atlanta, Ga., whence, by the Central Georgia railway system it can make connection with the Atlantic seaboard at Savannah or Port Royal.

The dominion of Canada is brought into direct relation with the United States system, by the Intercolonial, Great Western, and Grand Trunk railways. The stupendous enterprise and energy which, in the course of half a century, have spanned and intersected the North American continent with railway lines covering twenty degrees of latitude and sixty of longitude, are evident even in this outline. That, so far as the United States are considered, the present position of its railroads has not been reached without embarrassments, may be seen in the following table of the number of roads sold under foreclosure during the four years ending in 1879:

YEARS.	No. of roads.	Mileage.	Capital invested.
1876.....	30	3,846	\$217,848,000
1877.....	54	3,875	197,984,000
1878.....	48	3,902	311,631,000
1879.....	65	4,909	243,288,000
	197	16,532	\$970,751,000

In four years one-fifth of the entire railway mileage and capital of the United States was compelled by forced sale to change ownership.

At the close of the year 1879 there were in the United States 85,580 m. of railroad, employing 16,445 locomotive engines, 11,683 passenger cars, 423,013 freight cars. The capital stock of these roads amounted to \$2,292,257,877; their funded debt to \$2,297,790,916; and their total capital account to \$4,772,297,349. The cost of these railroads and their equipments was \$4,166,331,921. Their gross earnings amounted to \$529,012,999. In the twelve years between 1866 and 1878 the mileage of American railroads more than doubled. In the latter year the mileage by groups of states was as follows:

New England states.....	5,873
Middle states.....	15,454
Southern states.....	14,026
Western states.....	43,190
Pacific states.....	3,298

It will thus be seen that the western states had a mileage nearly one-third greater than that of all the other states put together—quite one-third, adding those in the Pacific states. The following table shows the relation of the railroads to the area of the different states in 1878:

STATE.	Area sq.m.	Miles of Railroad.	STATE.	Area sq.m.	Miles of Railroad.
Maine.....	85,000	988	Ohio.....	39,964	5,151
New Hampshire.....	9,280	1,209	Michigan.....	56,451	3,593
Vermont.....	10,212	873	Indiana.....	33,809	4,198
Massachusetts.....	7,800	1,872	Illinois.....	55,410	7,505
Rhode Island.....	1,506	208	Wisconsin.....	53,924	2,809
Connecticut.....	4,750	922	Minnesota.....	83,531	2,534
New York.....	47,000	5,839	Dakota.....	150,032	320
New Jersey.....	8,320	1,663	Iowa.....	55,645	4,265
Pennsylvania.....	46,000	6,010	Missouri.....	65,350	3,286
Delaware.....	2,120	279	Arkansas.....	52,198	783
Maryland.....	11,124	951	Texas.....	274,356	2,438
West Virginia.....	23,000	668	Nebraska.....	75,965	1,344
Virginia.....	38,348	1,645	Kansas.....	81,318	2,427
Kentucky.....	37,630	1,528	Colorado.....	104,500	1,164
North Carolina.....	50,704	1,448	California.....	188,981	2,148
Tennessee.....	45,000	1,665	Utah.....	84,476	543
South Carolina.....	34,000	1,418	New Mexico.....	121,201	8
Georgia.....	58,000	2,414	Nevada.....	124,125	627
Florida.....	59,248	486	Arizona.....	113,916	27
Alabama.....	50,722	1,830	Oregon.....	94,274	282
Mississippi.....	47,156	1,126	Washington Territory.....	69,994	212
Louisiana.....	41,346	466			

In 2,648,416 sq.m. of area there are 85,580 m. of railroad. Some comparison of this relation in foreign countries may be made.

COUNTRY.	Area sq.m.	Miles of Railroad.
Great Britain.....	111,000	16,082
France.....	204,000	11,000
Germany.....	210,000	13,500
Belgium.....	11,000	2,500

The United States have 1 m. of railway to every 32 sq.m. of area; Great Britain, 1 to every 7 of area; France, 1 to every 18; and Belgium, 1 to every 4.40 sq. miles. The proportion of railroad mileage to area as regards the different sections of the United States is as follows:

SECTION.	Area sq.m.	Miles of Railroad.
New England States.....	71,348	6,072
Middle States.....	103,440	13,791
Southern States.....	496,278	15,645
Western States.....	950,000	45,604

The New England states have 1 m. of railroad to 11½ sq.m. of area; the middle states 1 to 7½ of area; the western states 1 to 23; and the southern states 1 to 23. The increase in mileage in 1879 was greater than in any year since 1873, the following table showing the record of the year as to this point:

STATES.	Miles broad gauge.	Miles narrow gauge.	Total.	STATES.	Miles broad gauge.	Miles narrow gauge.	Total.
Arizona.....	153	153	Nevada.....	35	35
Arkansas.....	9	9	New Jersey.....	4	4
Colorado.....	7	60	67	New Mexico.....	125	125
Dakota.....	220	220	North Carolina.....	25	25
Georgia.....	10	25	35	New York.....	67½	6	73½
Illinois.....	90	90	New Hampshire.....	9½	9½
Indiana.....	74	40½	114½	Ohio.....	105	108½	213½
Iowa.....	325	46	371	Oregon.....	30	30
Idaho.....	90	90	Pennsylvania.....	14	5	19
Kansas.....	498	498	South Carolina.....	2	2
Kentucky.....	65	65	Tennessee.....	119	57	176
Louisiana.....	65	65	Texas.....	120	67½	187½
Maine.....	18	18	Utah.....	83	46	129
Maryland.....	18	18	Virginia.....	29½	29½
Massachusetts.....	11	11	West Virginia.....	20	20
Michigan.....	12	41½	53½	Wisconsin.....	60	60
Minnesota.....	394	394				
Missouri.....	161	27	188	Total.....	3,010	738½	3,748½
Nebraska.....	125	125				

The following table shows the number of miles of railroad in each group of states, Dec. 31, 1867-79, reported for Poor's *Manual*:

GROUPS OF STATES.	1867.	1868.	1869.	1870.	1871.	1872.	1873.	1874.	1875.	1876.	1877.	1878.	1879.

A fair average car-load is estimated at 26,000 lbs. On this basis the ordinary railroad freight car will hold: corn, 450 bush.; barley, 400 bush.; oats, 800 bush.; rye, 400 bush.; wheat, 425 bush.; bran, 1,000 bush.; flaxseed, 360 bush.; apples, 360 bush.; potatoes, 480 bush.; whisky, 60 bbls.; salt, 70 bbls.; lime, 70 bbls.; flour, 90 bbls.; flour, 200 sacks; cattle, 18 head; hogs, 50 head; sheep, 80 head; hard wood, 6 cords; solid board, 6,000 ft.; shingles, 40,000 ft.; hard lumber, 20,000 ft.; green lumber, 15,000 ft.; joist, scantling, and large lumber, 4,000 feet. Much discussion has arisen with regard to the proper unit of value for freight charges, one plan, that of making the car-load the unit, having the largest number of advocates in congress, state legislatures, and the American newspaper press. It is claimed by the opponents of this plan, that the car-load is eminently a variable quantity, and therefore not suited for a unit of value. The entire question of railroad management has been of late years constantly before congress and the legislatures of the different states (notably New York), and numerous investigating committees have considered the subject in all its bearings. Frequent complaints of discriminations and rebates in freight-rates in the case of favored individuals have aroused popular feeling in regard to the general management of freight transportation, and much crude opinion is exploited on the subject. It is a fact, that in the face of the enormous increase in transportation and demand for railroad conveniences, the charges for freight have steadily decreased during the decade ending in 1880. The free competition possible in America in building and running railroads, and the extraordinary liberality of the national government in land-grants and of state legislatures in franchises, combined with the certain though slow working of natural economic laws, are gradually solving many of the most complicated railroad problems to the practical satisfaction of all concerned. In Massachusetts and some other states, railroad commissioners appointed by the legislatures, have been given authority and jurisdiction in railroad affairs. The best political economists are still in doubt as to the advisability of such interference with railroad management as a business. Mr. Charles Francis Adams, who is an authority on the railroad question, is in favor of the federation of railroads, and is also of the opinion that eventually the American railway system will come under the control of the national government. In regard to this whole matter, Mr. Edward Atkinson, also a recognized authority, has recently offered the following valuable assurance: "There is much contention in this country in regard to the railroad corporation as a factor in our own politics, and much complaint is made in respect to alleged monopolies; but it will be observed that the great lines against which this charge is made—to wit, the systems consolidated and designated as the New York Central, the Erie, the Pennsylvania, and the Baltimore and Ohio—may also be named and designated as comprising the specific miles of railroad on which the largest service is done for the community at the least relative cost. It would matter not if all these lines were consoli-

dated, even under one man's guidance. The same rule would control him that now controls them all, and compels a constant abatement in the charge, constant improvement in method, and constant reduction in cost of operation. The rule is, that it is not the competition of rail with rail that controls or limits the charge, that may be made for their use, but the competition of product with product in the great markets of the country and of the world. No man, and no combination of men, can permanently prevent this competition working its just and beneficent results in the wider distribution of the elements of subsistence, in the abundant consumption of which material prosperity consists." (*The Railroads of the United States*, by Edward Atkinson. Boston, 1880: p. 30.)

RAILWAYS, ELEVATED. The plan of constructing a railway on the principle adopted by these roads was first undertaken in New York by the West Side (patented) Elevated railroad company, which was chartered in 1871, and sold out under foreclosure in the same year, being purchased by the New York Elevated railroad company, organized Jan. 3, 1872. The latter completed its road to its present termini in 1878; the lines extending from South ferry to Harlem river on the e. side of the city, 10.20 m., and on the w. side to 83d st., 6.27 m.; with branches at 42d st., 34th st., and city hall, 1.03 m.; in all, 17.50 miles. At the close of the year 1879 the rolling-stock of this line included 131 locomotive engines, 292 passenger cars, 8 service cars. The capital stock as originally authorized was \$10,000,000, of which \$6,500,000 was issued; the total stock and bonds of the road, representing its nominal cost, amounting to \$15,000,000. The road and property were leased May 20, 1879, to the Manhattan railway company, which commenced operating the road Sept. 1, 1879, guaranteeing the payment of interest on its bonds, and 10 per

cent dividends on the capital stock, dividends payable in quarterly installments. Following is a table showing—

ABSTRACT OF OPERATIONS AND FINANCIAL CONDITION.

YEARS.	Miles R.R.	Engines.	Cars.	Passengers carried.	Gross earnings.	Net earnings.	Interest paid.	Capital stock.	Funded debt.	Cost of construction.
1871-72.....	3.5	2	5	137,446	\$13,745	\$501	\$350,000	\$54,000

1877-78.....	14.85	61	114	4,916,322	429,988	179,261	150,972	3,190,125	4,809,000	8,493,170
1878-79.....	17.50	131	292	29,875,912	2,329,489	1,068,149	477,715	6,500,000	8,500,000

The second elevated railroad was organized as the Gilbert Elevated railroad company in 1872, and adopted the name Metropolitan Elevated railroad company in 1878. Its gauge is 4 ft. 8½ in.; rail all steel, 56 and 63 lbs. The road was opened June 4, 1878. In 1879 its rolling-stock comprised 56 locomotive engines, 180 passenger cars, 2 freight cars. May 29, 1879, the road was leased to the Manhattan railway company, whose capital stock was fixed at \$13,000,000; and whose total capital and funded debt, by its composition out of the two above companies, and under its organization, became \$30,000,000. The lines of this road extend from Kingsbridge via River st., 8th av., 110th st., 9th av. and 53d st., to 6th av.; also from 59th st. and 6th av., via 6th av., Amity st., South 5th av., W. Broadway to College place, Murray st., Church st., Beaver st., Pearl st. to Division st.; also from Division st., via Allen st., 1st av.; 23d st., 2d av., River st., to 8th av. and River st. The length of the road laid at the end of 1879 was 25.9 m.; the number of passengers carried in the year was 16,069,489; the number of accidents, 8 killed, 9 injured. The total earnings amounted to \$1,285,980.09; transportation expenses, \$709,524.47. The first of these roads was laid on the 9th av.; and, though freely patronized by those in its immediate vicinity, did not serve to popularize the idea of a railroad which is actually an enormously elongated iron bridge of slight appearing frame-work, and certainly liable to all the casualties and contingencies peculiar to iron bridges. The Metropolitan Elevated railroad through 6th av., while at once gaining an enormous patronage, roused much indignation on the part of storekeepers and property owners and holders along its route on account of its noise, complaints of dropping oil, dangers real and imaginary, etc. Gradually the objections were silenced as citizens became more accustomed to the existence of the roads, and now they are recognized as indispensable. By giving rapid transit to the northern wards of the city, they have made cheap rents with comfortable and healthy residences possible to the laboring man; while they afford to those in better circumstances a rapid and luxurious mode of passing between their homes and their places of business. The plan is being introduced in Brooklyn, and will doubtless be adopted by other cities.

RAIMONDI, MARCO ANTONIO, a celebrated engraver, was b. at Bologna in 1487 or 1488. He studied for several years under the celebrated painter Francia, the head of the old Bolognese school. On quitting Francia's studio, he went to Venice, and having seen there, for the first time, prints from the wood-cuts after Albert Dürer, he engraved on copper two sets of prints from that great master's designs, viz., those illustrating the "Life of the Virgin," and of the "Life and Passion of Christ;" to that of the former he attached the cipher or monogram of Albert Dürer, and it is said that the artist complained of the deception to the senate, but only obtained an order that in future the monogram of Albert Dürer should not be copied; at all events, the latter set is without the monogram or mark. From Venice Raimondi proceeded to Rome, soon attracted the notice of Raphael, and engraved those works after that master that are so highly valued. Raimondi greatly improved his style by imitating the remarkable delicacy and clearness exhibited in the engravings of Albert Dürer and Lucas van Leyden; and though, perhaps, in these qualities he did not surpass, or perhaps equal, these masters, he went far beyond them in power and purity of drawing, which he carried further than any other engraver; indeed, it has been stated that Raphael himself assisted the engraver in drawing on several of the plates.

After Raphael's death, having engraved some plates after drawings of a fanciful kind by Giulio Romano, he was thrown into prison by Clement VII., but was afterward liberated, taken under the protection of the pope, and fully employed. This prosperous state of matters, however, soon terminated, for on the sack of Rome by the Spaniards under the Constable Bourbon, in 1527, he was plundered of all he had, and was obliged to flee and take refuge in Bologna, where he seems to have lived till the period of his death, the exact date of which is not known, but it must have been after 1539, for a print by him, after Giulio Romano, of the "Battle of the Lapithæ," bears that date.

Good impressions of this eminent engraver's works bear, perhaps, a higher value than any other engravings; but there are numerous impressions from his plates to be met with

which are of little value, having been thrown off after they had been greatly worn, and repeatedly retouched. The best impressions are without the name of any publisher. After the plates were taken from the stock of Tommaso Barlacchi, they came into the possession of Antonio Salamanca; afterward, they passed through the hands of Antonio Lafreri, from thence to Nicholas van Aelst, and lastly, became the property of Rossi or De Rubens, and by that time they had been completely worn out.—See catalogue of Raimondi's engravings by baron Heineken, and Bartsch, vol. xiv. Very fine collections are to be seen in the British museum and the Louvre.

RAIN. At a given temperature air is capable of containing no more than a certain quantity of aqueous vapor invisibly dissolved through it, and when this amount is present, it is said to be saturated. Air may at any time be brought to a state of saturation by reducing its temperature; and if it be cooled below this point, the whole of the vapor can now no longer be held in suspension; but a part of it, passing from the gaseous to the liquid state, will be deposited in dew, or float about in the form of clouds. If the temperature continues to fall, the vesicles of vapor that compose the cloud will increase in number, and begin to descend by their own weight. The largest of these falling fastest, will unite with the smaller ones they encounter in their descent, and thus drops of rain will be formed whose size will depend on the thickness and density of the cloud. The point to which the temperature of the air must be reduced in order to cause a portion of its vapor to form cloud or dew, is called the dew-point.

Hence, the law of aqueous precipitation may be stated: Whatever lowers the temperature of the air at any place below the dew-point, is a cause of rain. Various causes may conspire to effect this object, but it is chiefly brought about by the ascent of the air into the higher regions of the atmosphere, by which, being subjected to less pressure, it expands, and in doing so, its temperature falls. Ascending currents are caused by the heating of the earth's surface, for then the superincumbent air is also heated and consequently ascends by its levity. Air-currents are forced up into the higher parts of the atmosphere by colder, drier, and therefore heavier wind-currents getting beneath them, and thus wedgeways thrusting them upward; and the same result is accomplished by ranges of mountains opposing their masses to the onward horizontal course of the winds, so that the air, being forced up their slopes, is cooled, and its vapor liberated in showers of rain or snow. Again, the temperature of the air is lowered, and the amount of the rainfall increased, by those winds which convey the air to higher latitudes. This occurs chiefly in temperate regions, or in those tracts traversed by the *return trade-winds*, which in the north temperate blow from the s.w., and in the south temperate zone, from the north-west. The meeting and mixing of winds of different temperatures is also known to produce rain, but not nearly to the extent at one time believed. It is also increased or diminished according as the prevailing winds arrive immediately from the sea, and are therefore moist, or have previously passed over large tracts of lands, and particularly mountain ranges, and are therefore dry. Since the rain-fall is evidently much modified by the temperature of the earth's surface over which the rain-producing winds blow, it follows that sandy deserts, by allowing solar and nocturnal radiation to take immediate effect in raising or depressing the temperature, and forests, by delaying, if not, in many cases, counteracting these effects of radiation, have each a peculiar influence on the rain-fall.

Rain is the most capricious of all the meteorological phenomena, both as regards its frequency and the amount which falls in a given time. It rarely or never falls in certain places, which are, on this account, designated the rainless regions of the globe—the coast of Peru, in South America; the great valley of the rivers Columbia and Colorado, in North America; Sahara, in Africa; and the desert of Gobi, in Asia, are examples; whilst, on the other hand, in such regions as Patagonia, it rains almost every day. Again, the quantities which have been recorded at some places to have fallen at one time, are truly enormous. In Great Britain, if an inch fall in a day, it is considered a very heavy rain. In many parts of the Highlands of Scotland, 3 in. not unfrequently fall in one day. On Dec. 5, 1863, there fell at Portree, in Skye, 12½ in. in 13 hours; and on the same day, 5.2 in. fell at Drishraig, near Loch Awe, where also, two days afterward, 7.12 in. fell in 30 hours. At Seathwaite, in Borrowdale, 6.62 in. fell on Nov. 27, 1845. But it is in continental, and especially tropical countries, where the heaviest single showers have been recorded. The following are a few of the most remarkable: At Joyeuse, in France, 31.17 in. fell in 22 hours; at Geneva, 30 in. in 24 hours; at Gibraltar, 33 in. in 26 hours; on the hills above Bombay, 24 in. in one night; and on the Khasia hills, 30 in. on each of five successive days.

In all places within the tropics where the trade-winds are blowing regularly and steadily, rain is of rare occurrence, the reason being, that as these winds come from higher latitudes, their temperature is increasing, and hence they are in the condition of taking up moisture rather than of parting with it; and the return trade-winds, which blow above them in an opposite direction, having discharged the greater part of their moisture in the region of the calms, are also dry and cloudless. Where, however, these winds are forced up mountain-ranges in their course, as on the e. of Hindustan, they bring rain, which falls chiefly during night, when the earth's surface is coolest. The region of calms is a broad intertropical belt about 5° in breadth, characterized by calms, and toward which the northern and southern trades (see TRADE-WINDS) blow. This, the region of calms,

is at the same time the region of constant rains. Here the sun almost invariably rises in a clear sky; but about mid-day clouds begin to gather; and in a short time the whole face of the sky is covered with dense black clouds, which pour down prodigious quantities of rain. Toward evening, the clouds disappear, the sun sets in a clear sky, and the nights are serene and fine. The reason of this daily succession of phenomena in the belt of calms is, that there the air, being heated to a high degree by the vertical rays of the sun, ascends, drawing with it the whole mass of vapor which the trade-winds have brought with them, and which has been largely added to by the rapid evaporation from the belt of calms; this vapor is condensed as it is raised toward the line of junction of the lower and upper trade-winds, and the discharge is in some cases so copious, that fresh water has been collected from the surface of the sea. As evening sets in, the surface of the earth and the superincumbent air are cooled, the ascending currents cease, the cooled air descends, and the dew-point is consequently lowered, clouds are dissipated, and the sky continues clear till the returning heat of the following day brings round a recurrence of the same phenomena. Since the belt of calms, which determines the rainy season within the tropics, moves northward or southward with the sun's declination, carrying the trade-winds with it on each side, it follows that there will be only one rainy and one dry season in the year at its extreme northern and southern limits; but at all intermediate places there will be two rainy and two dry seasons, at the equator these will be equally distant from each other.

This state of things is only of strict application to the Pacific ocean, whose vast expanse of water, presenting a uniformly radiating and absorbing surface, is sufficient to allow the law to take full effect. But over the greater part of the earth's surface disturbing influences draw the trade-winds more or less out of their normal course, and sometimes produce a total reversal, as in the case of the monsoons (q.v.). These winds determine entirely the rainfall of India, and but for them the eastern districts of Hindustan would be constantly deluged with rain, and the western parts constantly dry and arid. As it is, each part of s. Asia has its dry and wet season, summer being the wet season of the western parts and interior as far as the Himalaya, and winter the wet season of the eastern, and especially south-eastern parts.

The heaviest annual rainfall on the globe is 527 in., at Cherra Punji, on the Khasia hills, 494 in. of which falls from April to September during the s.w. monsoon. This astonishing amount is due to the abruptness of the mountains which face the bay of Bengal, from which they are separated by 200 m. of low swamps and marshes. The winds not only arrive among the hills heavily charged with the vapor they have absorbed from the wide expanse of the Indian ocean, but being near the point of saturation, their temperature not being raised in passing over these swamps, they are, so to speak, ready to burst in torrents over the abrupt cliffs which divert them from their horizontal course into the higher regions of the atmosphere. At 20 m. inland, the annual fall is reduced to 200 in.; 30 m. further s., it is only 100 in.; n., at Gowhatty in Assam, it is only 69 inches. In the n.w. of the bay of Bengal, at Cuttack, it is only 52 in.; while in the n.e., in Arracan, owing to the s.w. direction of the winds, it is from 200 to 240 inches. At Madras the annual fall is 48 in.; at Seringapatam, only 24 in.; at Bombay, 71 in.; at Ultra-Mullay, 263 in., and at Mahabalishwar, 254 in., both on the western Ghauts; and at Poona inland, 27 inches. The s.w. monsoon discharges from 50 to 90 in. of rain over the parts of Hindustan not bounded by high mountains to the w., before reaching the Himalayas, after which it discharges the greater part of its moisture, 120 to 140 in., on the outer Himalayan range, at elevations of 4000 to 8000 feet. Thus, four times more rain falls annually on the Khasia hills than on the Himalaya, owing to the less abrupt face these latter mountains present to the s., to the sandy burning plain, which raise the winds considerably above the dew-point, and to the larger tract traversed by the winds, over which their moisture continues to be discharged as they pass.

The following are a few of the annual rainfalls in the tropics: Singapore, 97 in.; Canton, 78 in.; St. Benoit (Isle of Bourbon), 163 in.; Sierra Leone, 126 in.; Caracas, 155 in.; Pernambuco, 106 in.; Rio Janeiro, 45 in.; Georgetown, 95 in.; Barbadoes, 50 in.; St. Domingo, 107 in.; Bahamas, 55 in.; and Vera Cruz, 183 inches. In many places in the interior of continents within the tropics, the rainfall is small—not greater, in fact, than in temperate countries, such as the eastern parts of England. At Poona, only 23 in. fall annually.

The periodicity of the rain-fall disappears as we recede from the tropics, and the times of the year during which it occurs are different—the greater quantity falling in summer at places within the tropics and in the interior of continents, but in winter in countries bordering on the sea in temperate regions. In respect of the rain-fall, Europe may be divided into two distinct regions: Western Europe and the countries bordering on the Mediterranean. A vast ocean on the one hand, a great continent on the other, and a predominance of w. winds, are the determining circumstances in the distribution of the rain-fall over western Europe. As the s.w. winds, which are the return trades, descend to the earth and blow over the surface of Europe, and as the whole of this continent is thus within their influence, it follows that the western parts, especially where mountain-ranges stretch n. and s., are rainy districts; for these mountains, diverting the s.w. winds from their horizontal course, force them up into the higher regions of the atmosphere, where, chilled, they form into clouds, or deposit in rain the vapor they can

no longer hold in suspension. Hence the rainiest regions of Europe are Norway, Ireland, the w. of Great Britain and of France, Spain, and Portugal. At the Styx, in the lake district, 38.9 in. fell in Jan., 1851; at Drishaug, 33.2 in., and at Portree, 32.4 in. in Dec., 1863; and in the same month, from 23 to 30 in. at many other places in the Scottish Highlands. In the w. of Great Britain and Ireland, in the vicinity of high hills, the average rain-fall is from 80 to 128 inches. At Bergen, in Norway, it is 70 in.; in the peninsula, at Oporto, it is 54 in.; at Bilbao, 47 in.; and at St. Jago, 65 in.; and in France it is 51 in. at Nantes and 49 at Bayonne. At places at some distance from hills, and in more inland districts, the annual fall is much diminished. Thus, in the w. of Great Britain, away from hills, it is from 30 to 45 in., while in the e. it is from 20 to 28 inches. In France it averages 30 in.; and in the plains of Germany and Russia, 20 in.; while in some parts of Sweden and Russia it falls as low as 14 inches. In the interior of Europe, in mountainous districts, it rises much above these amounts; thus at Ischl it is 62 inches. An important distinction between the mode of distribution of the rain-fall in the w. of Europe and that of more inland places is that the greater part of the annual amount in the w. falls in winter; but in the interior in spring or summer. This difference is particularly striking on the different sides of Great Britain, and arises from this circumstance, that, as the clouds are much lower in winter, they are arrested and drained of their moisture by the less elevated hills, leaving little to be deposited eastward; but in summer being high they pass above and discharge themselves in the interior. Thus for every 10 in. of rain which fall at the following places in winter, there fall in summer respectively 8½ in. in the w. of Great Britain, 11 in. in the e. of Great Britain and w. of France, 15 in. in the e. of France, 20 in. in Germany, and 27 in. in the n. and e. of Russia.

The peculiarity of the rain-fall of the basin of the Mediterranean depends on its proximity to the burning sands of Africa, a predominance of northerly winds, and the position of the Pyrenees and Spanish sierras to the w., on which the s.w. winds discharge their rains before arriving on the n. shores of the Mediterranean. In the valley of the Rhone four times more rain falls in autumn than in summer; and s. of the Alps six times more rain falls with the n.e. than with the s.w. winds, being the reverse of what takes place in England. In Italy the quantity diminishes as we approach the south. On the coasts of the Mediterranean it rarely rains in summer, but frequently in winter. In the valley of the Rhone the annual fall ranges from 20 in. at its mouth to 63 in. at St. Rambert, the average being 30 inches. This is also the average of the valley of the Po; but on ascending to the Alps it rises, as at Tolmezzo, to 96 inches.

The rain-fall in the w. of the American continent is distributed similarly to that of Europe—the amount being dependent on the physical configuration of the surface over which the westerly winds blow. The yearly amount increases as we proceed northward; thus at San Francisco it is 21 in.; at Fort Reading, 29 in.; at Fort Oxford, 72 in.; at Fort Vancouver, 47 in.; at Astoria, 86 in.; at Steilacoom (Washington territory), 54 in.; and at Sitka, in Alaska, 82 inches.

But in the United States the manner of the distribution of the rain is very different from that of Europe. The United States are dependent for their rain not on the Pacific ocean, but on the gulf of Mexico. There can be little doubt that, but for the high range of the Rocky mountains in Central America, the greater part of the states would be an arid waste. These mountains are so high as to present an effectual barrier to the passage of the trade-winds which blow over the gulf of Mexico; they are, on this account, turned northward, and spread themselves over the states, especially over the low basin of the Mississippi. These winds being characterized by great heat, and loaded with much moisture from the warm waters of the gulf of Mexico, tend to disturb the statical equilibrium of the atmosphere. When they have blown for some time, vast accumulations of heat and moisture take place, the equilibrium is destroyed, a great storm arises in consequence, sweeping eastward over the states, and in many cases crossing the Atlantic and descending with violence on western Europe. In the states, the southerly winds preceding the storm give place to the dry n.w. winds, which rapidly clear the sky and bring brilliant bracing weather in their train. It appears, in short, that the s. winds from the gulf of Mexico spread the moisture over the states, and the n.w. wind disengages this moisture from them by getting below them, by their greater density, and thrusting them into the higher regions of the atmosphere. If this be the case, as the phenomena seem to warrant, then the heaviest rain-falls will be in the valleys, and the least on the higher grounds—a mode of distribution quite different from what prevails in Europe. And such is really the case, for the greatest amount of rain falls in Florida, the low flats of the Mississippi, then along its valley, and lastly in Iowa, or in that remarkable depression at the head of the river; and the least quantities on the Alleghanies, especially on their higher parts, and on the high grounds of the Missouri district. The following figures, giving the average annual amount in inches, show this in a clear light: Pensacola, 57; Fort Brooke, 55; and Fort Pierce, 63—in Florida: Monroeville, 66; and Mobile, 64—in Alabama: Natchez, 58; Jackson, 53—in Mississippi: Rapides, 68; New Orleans, 52—in Louisiana: Savannah, 48—in Georgia: Nashville, 55—in Tennessee: Dubuque, 35—in Iowa. At Athens, in Georgia, s. of the Alleghanies, the amount is 36 in.; at Alexandria, in Virginia, also 36 in.; and at Jefferson, in Missouri, 38 inches. In the northern states the quantity diminishes at most

places to between 27 and 45 in., and the mode of its distribution becomes assimilated to that of Europe.

When rain-drops fall through a stratum of air below 32°, they become frozen, and form *hail* (q.v.). When the vesicles are formed in air under 32°, *snow* (q.v.) is the result.

RAIN BOW. The ordinary phenomena of the rainbow are usually visible on every occurrence of a "sunny shower," and we need not describe them particularly until we deduce them, one after another, from their cause. The most careless observation shows us that, for the production of a rainbow, we must have a luminous body of moderate angular diameter, and *drops* of water; for it is never seen except by direct sun or moon light, and never in a cloud unless rain be falling from it. Now, a falling drop of water takes, by its molecular forces, a *spherical* form. Also, as there is separation of the various colors of which white light is composed, the cause of the phenomenon must involve *refraction* of light (q.v.), because by reflection (q.v.) these colors are not separated. But, again, the spectator who views the rainbow has his back to the sun, and rays of light merely refracted by a rain-drop could not be thus sent back to the spectator. The phenomenon must therefore depend upon successive reflections and refractions, and we shall investigate in an elementary manner what appearances we ought to *expect* as the result of such processes according to the known laws of optics; merely premising that the fundamental points of the explanation were first given by Newton in the second book of his *Optics*.

First, then, let us consider what becomes of parallel rays of light, of *one color* or refractive index (see REFRACTION), which are successively refracted and reflected in a single spherical rain-drop.

For our immediate purpose it is sufficient to suppose that the refractive index (see REFRACTION) of water is $\frac{4}{3}$; that is, the incident and refracted rays make with the perpendicular to the refracting surface of water, angles whose sines are in the ratio of 4 to 3.

Let the circle represent a section of the drop made by *any* plane passing through its center O, and the line SO, which joins its center with the sun; the sun being supposed, for the moment, to be a single luminous point, situated at so great a distance that lines

FIG. 1.

FIG. 2.

drawn to it from different points of the drop are parallel. A ray of light, SB, falling on the drop in the plane of section will be, of course, partly reflected and partly refracted at B. The reflected part does not concern us, as in it all colors would travel together; and, in fact, the result of reflection from the external surfaces of the drops is simply to illuminate the background feebly. Join OB, and produce it to Q. Then the refracted ray (see REFRACTION) will have in the drop the direction BA, where the ratio of the sines of SBQ and OBA is the refractive index of water—i.e., 4 : 3 nearly. Arriving at A the ray will be partly refracted in some such direction as AD, and the rest reflected in the direction AC. Now AD obviously cannot fall on the eye of a spectator whose *back* is turned to the sun, and it has, therefore, nothing to do with the rainbow. The internally reflected ray AC, on reaching the surface at C, is partly refracted in the direction CT (where BS and CT are symmetrically situated on opposite sides of OA), and partly reflected internally. The latter portion we must consider when we come to the cause of the *secondary*, or outer rainbow, the former is that which at present concerns us. Let SB1, SB2, be other incident rays. After a refraction, a reflection, and a second refraction, they emerge in the directions C1T1, C2T2, respectively. From the figure, which is drawn from calculation, it is obvious that both C1T1 and C2T2 are *less* inclined to OS than CT is. Hence for rays, parallel to SO, falling on the drop, and emerging after suffering two refractions and a reflection, the *final* direction is more and more

inclined to SO, as the point of incidence, B_1 , is further from P, at least up to some such point as B; after which (for points situated as B_2) it diminishes again. By proper mathematical methods it is easy to find that the angle SOB is about $59^\circ 24'$, if the refractive index be $\frac{4}{3}$. Now, by a general property of maxima or minima in optics (see CAUSTIC), the rays falling on the drop near to B will emerge nearly parallel to CT; while those incident near any other point (as B_1) will be widely scattered at emergence. And we may evidently extend this reasoning to all other rays by supposing the above figure to rotate about the axis SO.

The conclusion is, therefore, that if homogeneous light fall in parallel lines on the spherical drop, those rays which have been *twice* refracted at the surface, and *once* internally reflected, will, on emergence, all lie within the cone formed by the revolution of CT about SO, and will be *condensed* toward the surface of that cone. Hence such an illuminated drop gives off by this particular process a solid cone of rays, much condensed toward its external boundaries.

So much for each drop. Next, let us inquire what the appearance will be to an eye in any given position. Referring to the next figure, in which the letters are the same as in the former, draw TS' parallel to SO. Then TS' is the direction of the line drawn to the point α in the heavens diametrically opposite to the sun. So are E_1S_1' and E_2S_2' , drawn from any assumed positions, E_1 and E_2 , of the spectator's eye.

If the eye be placed in the surface of the cone just described, as at T, it will receive the condensed ray which emerges in the direction CT; if at E_1 (within the cone), it will receive diffused rays from the drop; if at E_2 (outside the cone), it will receive no light at all.

To put this in a simpler form: Draw E_1F_1 and E_2F_2 parallel to TC; then we may evidently say that the eye receives a condensed light from any drop whose angular distance from the point opposite the sun is CTS', a diffused light if the angular distance be less than this, and none at all if it be greater. By methods already alluded to, it is found that CTS' is nearly $42^\circ 12'$ for the index of refraction $\frac{4}{3}$.

Hence, if the sun were a luminous point, emitting homogeneous light whose index of refraction in water is $\frac{4}{3}$, a spectator looking through a shower of falling raindrops toward the point immediately opposite to the sun, would see a bright circle of angular diameter $84^\circ 24'$ surrounding this point, diffused light within that circle, and darkness without it.

The effect of the finite angular diameter of the sun is evidently to widen this circle into a circular luminous band, whose breadth is the sun's apparent diameter, and whose mean radius is $42^\circ 12'$.

Next, let us consider the different refrangibilities of the colored constituents of white light. The investigation above hinted at shows that the radius of the luminous circular band is greater, the less the refractive index; the proof, though very simple, would be out of place in this work. Hence the appearance actually observed with sunlight will be formed by the superposition of concentric, overlapping, circular bands, the radii being less and less as we consider the primary colors in the order from red to violet (see SPECTRUM). That is, we shall have a circular illuminated space, brightest toward the edge, with a homogeneous red ring as its external boundary, and a gradual mixture of the prismatic colors as we look nearer to the center. This agrees very well with observation, and so do the calculated diameters of the external red ($42^\circ 22'$) and internal violet ($40^\circ 35'$) rings.

But what becomes of the light *twice* reflected inside the drop, and then refracted out? Let fig. 3 represent again a section of the drop, with sunlight falling on it in lines parallel to SO, and let us trace the course of one ray, as SB.

The part reflected at B is to be disposed of as before; it goes merely to illuminate, feebly, the otherwise dark background of cloud and vapor. The refracted portion proceeds, as before, to A, where part is reflected internally along AC, and part refracted out. The latter portion, as we have already seen, cannot possibly reach the eye of a spectator whose back is turned to the sun. Similarly, at C, there is internal reflection along CD, and refraction out of the drop. The refracted part has already been considered, as the cause of the *primary* rainbow. The reflected part will again at D be separated into two; one, reflected internally, which proceeds to form the tertiary and higher orders of bow; and the other, escaping from the drop in the line DT, which goes to form the *secondary* bow. This we

FIG. 3.

will consider with some care, because the secondary bow, though necessarily fainter

than the primary, is usually seen; the tertiary and higher bows, each much fainter than the preceding one, since the beam inside the drop is weakened at each succeeding reflection, require no notice, as even the tertiary has never been observed in nature.

As before, we have traced the courses of two other beams, SB_1 and SB_2 , in their passage to form part of the secondary bow. They are respectively $SB_1A_1C_1D_1T_1$ and $SB_2A_2C_2D_2T_2$; and the figure shows us that the final rays D_1T_1 and D_2T_2 are each *more* inclined to SO than DT is. There is, therefore, a particular ray, SB , whose final direction, DT , is *less* inclined to SO than that of any other ray which has suffered two refractions and two internal reflections; and, as before, the emergent light is condensed toward this minimum. If, then, the figure be made to revolve about SO , we see that DT will describe a cone, that *inside* this cone there is no refracted light, that toward the surface of the cone, part of the light is condensed, and that the rest of it is diffused through *exterior* space.

So much for one drop; let us now, as before, consider what will be seen by an eye in any position with regard to this particular drop.

FIG. 4.

ers increasing from the red to the violet. Hence the secondary rainbow has its inner edge red, and its outer violet; the intermediate space being an exceedingly mixed, or impure spectrum (q.v.). The results of geometrical optics show us that the angular diameter of the red is $100^\circ 48'$, and of the violet $106^\circ 44'$; so that the breadth of the bow is $3^\circ 30'$ nearly.

In nature, these rough results are pretty closely verified; but a more profound investigation into the circumstances of the problem shows us some modifications. In the first place, we find that for each kind of homogeneous light the actual maximum of brightness is in a circle of rather less angular diameter than that given by the more elementary investigation for the primary bow, and rather greater for the secondary. Secondly, and still with homogeneous light, there is a succession of feebler and feebler concentric circles of maximum brightness—inside the principal maximum in the primary bow, and outside it in the secondary. These give rise to what is always seen in a fine rainbow, the so called *spurious* or *supernumerary* bows, lying close inside the violet of the primary bow, and outside that of the secondary. These are fainter and more impure as they proceed from the principal bow, and finally merge into the diffused white light inside the primary bow, and outside the secondary.

The angular dimensions of these bows, principal and spurious, were calculated from theory by Airy, and carefully measured by Miller in the artificial bow formed by passing light through a very fine column of water descending through a small aperture, and the accordance was perfect.

The lunar rainbow, which is a comparatively rare, but very beautiful phenomenon, differs from the solar simply in the source and intensity of the light by which it is produced; and, as in all cases of feeble light, the distinction of the colors is very difficult. In fact, except under the most favorable circumstances, the lunar rainbow rarely shows colors at all, giving a pale ghostly gleam of apparently white or yellow light.

RAIN-GAUGE. The use of rain-gauges is to ascertain the amount of rain which falls at any given place. They are of various constructions. The simplest is that which consists of a metallic cylinder, from the bottom of which, a glass tube, divided into inches and parts of an inch, projects downward. It is provided with a funnel, inserted within at the top, to prevent evaporation, and the rain-water is emptied out by means of a stop-

In fig. 4, the letters denote the same things as in fig. 3. Hence if the eye be placed at T , it will receive the maximum of light, in a direction making an angle DTS' with the point in the heavens opposite to the sun. If at E , it will receive some of the diffused light from a drop whose angular distance from the point opposite the sun is *greater* than DTS' ; and if at E , it will receive no light at all, the drop's angular distance from the point opposite the sun being *less* than DTS' . Hence the appearance presented by a shower of drops is, for homogeneous light coming in parallel lines, a bright circle, whose angular radius is DTS' ; diffused light outside that circle, and no light within it. When the light comes from a source of finite angular diameter, as the sun, the only effect is, as in the primary bow, to *widen* the bright circular band. When we consider the various components of white light, calculation shows us that DTS' is least for red, and greatest for violet. Hence we have a series of concentric colored bands superposed, their diam-

cock at the bottom, or, still simpler, by a hole pierced in the funnel at the top. As this form of gauge is objectionable on account of the frequent breakage of the glass-tube by frost, a float is used instead, which is raised by the water, and a scale is attached to it, to show the quantity of rain received. As this gauge does not admit of very nice readings, another sort is frequently employed, viz., a receiving-vessel and a glass measure of much smaller diameter, which thus admits of as nice graduation as may be desired. As, practically, there is often great difficulty or trouble experienced in replacing the glass measure when it chances to get broken, the late G. V. Jagger Ráo, a wealthy zemindar of Vizagapatam, proposed a gauge in the form of a funnel having a diameter of 4.697 in., or an area of 17.33 sq. inches. Now, as a fluid ounce contains 1.733 cubic in., it follows that for every fluid ounce collected by this gauge, the tenth of an inch of rain has fallen. This measure can, of course, be graduated to any degree of nicety, and may be reproduced at pleasure. It has also the great merit of being by far the cheapest gauge, costing only 4s. 6d. Self-registering rain-gauges have been invented by Osler, Crosley, and Beckly, but they are too expensive to come into common use.

A most important point with regard to the rain-gauge is its height above the ground. Prof. Phillips found the fall of rain at York for 12 months in 1833-34, to be 14.96 in. at a height of 213 ft. from the ground; 19.85 in. at 44 ft.; and 25.71 in. on the ground. This remarkable fact—viz., that different quantities are collected at different heights, the amount being always greater at the lower level, has been confirmed wherever the experiment has been made. No perfectly satisfactory account has yet been given of this singular phenomenon. The condensing of the vapor of the atmosphere on the surface of raindrops as they fall—the rebound of the finer particles into which many of the drops break themselves as they strike with violence on the ground—and the eddies and currents which prevail most and strongest around isolated objects raised above the surface of the ground, to a large extent account for the phenomenon. Of these three, the greatest weight is to be given to the last two; and this is confirmed by the fact, that a gauge placed on the roof of a building that happens to be flat, of considerable area, and with few or no chimney-stalks to disturb the air-currents, collects an amount equal to that collected at the same place by a gauge on the ground. The proper size and shape of the rain-gauge, and its height above the ground, so as to measure with the greatest exactness possible the real quantity of rain that falls, about all of which much diversity of opinion exists, have been ably investigated by series of extensive experiments conducted by maj. Ward, Mr. Symons, rev. Charles Griffith, and others, and the results have been published annually in Symons's *British Rainfall*.

RAIN-PRINTS, small pits observed on the surfaces of some argillaceous rocks, and believed to be the impressions of rain-drops. See **ICHOLOGY**.

RAINS, a co. in n.e. Texas, drained by the Sabine river and the Lake fork, crossed by the Texas and Pacific railroad; about 225 sq. miles. The surface is hilly. The soil is fertile. The chief productions are corn, cotton, tobacco, and cattle. Co. seat, Emory.

RAINY LAKE forms a portion of the boundary-line between British North America and the United States. It is situated 160 m. w. of lake Superior, is 1160 ft. above sea-level, and is about 35 m. long, and 5 m. in average breadth. Its surplus waters are carried off to the Lake of the Woods, in a w.n.w. direction, by the Rainy river, which is about 100 m. in length, and the banks of which are covered with pine-forests.

RAI SANYO, 1780-1833; the greatest of Japanese historians. His works contributed greatly to form the opinions of the men who in 1868, backed by public sentiment, overthrew the tycoon and the dual system of government. His greatest work, upon which he labored for 20 years, is the *Nihon Guashi*, or Military History of Japan. It is in 22 vols., and narrates the history of Japan from the 12th to the 17th c., as shown in the rise to power, and decay of the great military families whose chiefs were called shōguns, or generals; afterward by foreigners called "Tycoons." His other work was posthumously published, and treats of the history of Japan from 660 A.D. to the end of the 16th century. Portions of the *Guashi* have been translated into English by Mr. Ernest Laton of the British legation. For the preparation of his great work Rai sifted over 650 native books, some of them very detailed and voluminous. The unmistakable animus of his works is to show that the mikado alone is and always was the sovereign of Japan, and that the shōguns were usurpers.

RAISED SEA-BEACHES. See **BEACHES RAISED**.

RAISINÉE, a *rob*, or sweetmeat, much esteemed in France, made by boiling new wine, and skimming until only half the quantity of wine remains; after which it is strained; apples, pared and cut into quarters, are added to it, and it is allowed to simmer gently, till the apples are thoroughly mixed with the wine, when it has a very pleasant sweetish-acid taste. Cider may be used instead of wine.

RAISINS are dried grapes, prepared by two different methods. The one method consists in partially cutting through the stalk of the ripened bunches, and allowing them to shrink and dry upon the vine by the heat of the sun. These are by far the better sort, and are called *raisins of the sun*, or muscatels. Malaga is much celebrated for its sun-raisins, which are the finest in the world. The raisins prepared by the other method are called *lexias*, and are gathered and hung on lines, or laid on prepared floors to dry in

the sun. When dried, they are dipped in a hot *lye*, made by dissolving the alkali out of wood-ashes or barilla with water, until the filtered fluid has a specific gravity of about 1.100; to this is added, for every four gallons, a pint of olive oil and a quarter of a pound of salt. After dipping, the fruit is laid on hurdles of wicker-work to drain, and is continually exposed to the sun for about a fortnight. The raisins are then pulled from the stalks, and packed into boxes for transport to other countries. The qualities best known in the markets are Valencias and Denias from Spain, Malagas from Malaga, and black Smyrnas and Sultanas from Asiatic Turkey. The currant (q. v.), or corinth, as it was originally called, is only a small variety of grape peculiar to the Greek islands, cured in the same way, and in itself forming a large staple of those islands. In 1875 Britain imported 27,575 tons of raisins, and currants to the amount of 53,140 tons.

RĀJAH, or more correctly **RAJĀ** (from the Sanskrit *rājan*, king, cognate with the Latin *reg* of *rex*), is originally a title which belonged to those princes of Hindu race who, either as independent sovereigns or as feudatories, governed a territory; it then, however, became a title given by the native governments, and, in later times, by the British government to Hindus of rank, and it is now not uncommonly assumed by the zemindars or land-holders; the title mahārājah, or "great rājah," being, in these days, generally reserved to the more or less independent native princes. According to the ancient social system of India, the rājah belonged to the kshatriya or military caste (see CASTE); now, however, the title is given to, and assumed by members also of an inferior caste.

RAJAMAHE NDRI, or **RAJAMUNDRY**, a t. of Hindustan, capital of the district of Godavari, in the presidency of Madras, stands on the left bank of the Godavari, about 50 m. from the mouth of that river, and in long. 81° 53' east. To the n. of the town is the fort, a square edifice, comprising the barracks, hospital, jail, and magazine. The nobler kind of game, as well as wild-fowl of all sorts, abound in the vicinity, and the situation and scenery are in the highest degree beautiful. The Godavari is here about 2 m. wide, and is crossed by a steam-ferry. Napkins and table-cloths are manufactured. Pop. 19,738, about a fourth of whom are Brahmans. The collectorate of Godavari, of which Rajamahendri is the capital, has an area of 6,224 sq. m., and a pop. (71) of 1,592,939.

RĀJATARANGINĪ (or "the river of kings," from the Sanskrit *rājan*, king, and *taranginī*, a river or stream) is the name of four chronicles of the history of Cashmere written in Sanskrit verse; the first by *Kalhan'a*, bringing the history of Cashmere till about 1148 after Christ; the second, a continuation of the former, by *Jonarāja*, to 1412; the third, a continuation of the second, by *Srīcara*, a pupil of Jonarāja, to 1477; and the fourth, by *Prāyabhalla*, from that date to the conquest of the valley by the emperor Akber. Among these chronicles, however, it is especially the first which has earned a great reputation, inasmuch as it is the most important and the completest of all known Hindu chronicles, and, for this reason, may be considered as the only surviving work of Sanskrit literature which betrays an attempt at historiography. The author of the work, the Pandit Kalhan'a—of whom we merely know that he was the son of Champuka, and lived about 1150, under the reign of Sinhaddeva of Cashmere—reports that before entering on his task, he had studied 11 historical works written previously to his time, and also a history of Cashmere by the sage Nila, which seems to be the oldest of all; but that, not yet contented with these sources of information alone, he had also examined old documents, such as grants and proclamations made by kings, texts of laws, and sacred books. It may be presumed, therefore, that Kalhan'a had not merely the desire, but set honestly to work to elucidate the history of Cashmere up to his date. And so far as the last few centuries preceding him are concerned, it is possible that the facts narrated by him are reliable; but, owing to the unceritcal disposition of the Hindu mind in all matters that regard historical facts, those especially of a more or less religious or legendary character, and also to his bias to produce a consistent system of chronology, great doubts must attach to all that relates in his work to the ancient history of India. In spite of these shortcomings, however, which are more those of the nation to which the author belonged, than those of the individual himself, much that is reported by Kalhan'a is the only source of information we have of the history of Cashmere, and much very valuable as coming from an indigenous source. Kalhan'a begins his work, as may be expected, with the mythological history of the country; the first king named by him is Gonarda, who, according to his chronology, would have reigned in the year 2448 before Christ; and the last mentioned by him is Sinhaddeva, about 1150 after Christ. The Sanskrit text of the complete work, together with that of the three other Rājataranginīs, which is of little extent, has been edited at Calcutta, 1835, under the auspices of the general committee of public instruction and the Asiatic society of Bengal. Six sections of it have been edited with notes, and learned appendixes, in French, by A. Troyer, who likewise translated into French these sections, as well as the remaining two (*Rājataranginī. Histoire des Rois du Cachmir*, etc., vols. i. to iii., Paris, 1840-52).—See also H. H. Wilson, *An Essay on the Hindu History of Cashmir*, in the *Asiatic Researches*, vol. xv., and Lassen's *Indische Alterthumskunde*, vols. i. and ii.

RAJMAHAL', a t. of India, in the district of Bhaugulpore, Bahar, lower provinces of Bengal, and a station on the line of railway from Calcutta to the n. w. frontier, stands on

a steep eminence on the right bank of the Ganges, 200 m. by land n.n.w. of Calcutta. Its position is advantageous, and it was long the chief town of the Bengal and Bahar provinces. Since the removal of the British courts of justice, however, its prosperity has declined. It now presents a deserted and ruinous appearance, but is still noteworthy for the remains of its once splendid palace, and for its important transit-trade. It contains twelve market-places, and has about 30,000 inhabitants, most of whom are employed in providing for the wants of the vast number of travelers who pass through the town by land and water.

RĀJPOOTS, or **RĀJPUTS** (from the Sanskrit *rājan*, king, and *putra*, son; hence literally, "sons of kings"), is the name of various tribes in India which are of Aryan origin, and either descended from the old royal races of the Hindus, or from their Kshatriya or warrior caste (see **CASTE**). At all periods they seem to have played a conspicuous part in the history of India; and all over Hindustan there are many families who, rightly or wrongly, claim the title of Rājputs. At present they occupy chiefly the country known as Rājasthān or Rājputana, including, among other states, those of Mewar, Marwar, Jeypur, Bikanir, Jessulmir, Kotah, and Bundi. Before the invasion of Mahmud the Ghiznevide, four great kingdoms were under the dominion of Rājput families—viz., Delhi, Kanoj, Mewar, and Anhilvarra; and all the kings mentioned in the *Rājataranjini* (q.v.) of Kalhana were of Rājput origin.—For the history, etc., of the Rājpoots, and the geography of Rājputana, see col. James Tod's *Annals and Antiquities of Rājasthān, or the Central and Western Rājput States in India* (2 vols., Lond. 1829); Ritter's *Erdrkunde*, vol. vi. pp. 724, ff.; Lassen's *Indische Alterthumskunde*, vols. i. and ii. (*passim*); A. Troyer's *Rājataranjini*, vol. iii. (*Eclaircissements historiques*, etc.).

RAKE, an agricultural and horticultural implement, in use from very ancient times. In its simplest form it consists merely of a bar of wood or iron, with wooden or iron teeth inserted into it, and attached at right angles across the end of a long handle. It is used for collecting straws, etc., from a field after it has been reaped or mown, or stones from newly tilled ground, sometimes also in gardens, for covering seeds. A long rake, with a short triangular framework instead of a handle, and curved teeth, is much used in hay-fields in England, and is known as the *ell-rake*. Rakes are also adapted for being drawn by horses, and there are many modifications both of the hand-rake and the horse-rake.

RAKE, in naval language, has more than one meaning. The rake of a ship's stern or bow is the length to which the keel would have to be prolonged to bring it under the most projecting point of the stern or bow. Raking masts are masts set aslope, so that the angle they make with the keel toward the stern is less than a right angle, as in a brigantine. To rake a ship is to bring guns to bear so as to fire them along her deck from end to end; this is the most disastrous thing that can happen to a vessel in action, and it is the object of all good seamanship to avoid it. When a ship is raked at short range, grape can be used with great and fatal effect.

RAKING MOLDING, a molding not horizontal or vertical, but sloping at an angle. When joined to a horizontal molding, the raking molding is run so as to miter with the true vertical profile of the former, and is therefore different from it in section.

RAK'OCZY, a family of Hungarian nobles in Transylvania, of whom the most distinguished was Francis II., 1676-1735. In 1701 he was imprisoned on an accusation of conspiracy to incite rebellion, but he escaped to Poland, raised a band of revolutionists, gained possession of Hungary and Transylvania, and was in the pay of Louis XIV. in the war of the Spanish succession. In 1705 the insurgent parts of Hungary united themselves in a confederation, and placed Rakoczy at the head. In 1708 he was defeated by the Austrians; dissensions sprang up in the confederation, and during his absence in Poland, 1711, a treaty of peace was negotiated between Austria and the confederation. He died in Turkey. He gave an account of the Hungarian insurrection in his *Mémoires sur les Révolutions de Hongrie*, 1738.

BAKO CZYMARSCH, a simple but grand military air by an unknown composer, said to have been the favorite march of Francis Rakoczy II. of Transylvania, and at all events much played in his army. The Magyar Hungarians adopted it as their national march, and in 1848 and 1849 it has been alleged to have had the same inspiring effect on the revolutionary troops of Hungary as the *Marseillaise* on the French. Like the *Marseillaise* in France, it has been placed under the ban of the Austrian government at various periods of political excitement. In 1848 several attempts were made by Hungarian poets to set it to appropriate verses, but without much success. The air most generally known in Germany and elsewhere out of Hungary as the *Rakoczymarsch*, which is introduced by Hector Berlioz in his *Damnation de Faust*, is a weak paraphrase of the original by Ruziska.

RAKSHAS, or **RĀKSHASA**, is, in Hindu mythology, the name of a class of evil spirits or demons, who are sometimes imagined as attendants on Kuvēra, the god of riches, and guardians of his treasures, but more frequently as mischievous, cruel, and hideous monsters, haunting cemeteries, devouring human beings, and ever ready to oppose the gods and to disturb pious people. They have the power of assuming any shape at will, and their strength increases toward the evening twilight. Several of them are described as having many heads and arms (see, for instance, **RĀVANA**), large teeth, red hair, and, in

general, as being of repulsive appearance; others, however, especially the females of this class, could also take beautiful forms in order to allure their victims. In the legends of the *Mahāshārata*, *Rāmāyana*, and the *Purāṇas*, they play an important part, embodying, as it were, at the period of these compositions, the evil principle on earth, as opposed to all that is physically or morally good. In the *Purāṇas* they are sometimes mentioned as the offspring of the patriarch Pūlāstya, at other times as the sons of the patriarch Kas'yapa. Another account of their origin, given in the *Vishṇu-Purāṇa*, where, treating of the creation of the world (book i. chap. v.), is the following: "Next, from Brahmā, in a form composed of the quality of foulness, was produced hunger, of whom anger was born; and the god put forth in darkness beings emaciated with hunger, of hideous aspects, and with long beards. Those beings hastened to the deity. Such of them as exclaimed: 'Not so, oh! let him be saved,' were named Rākshasa (from *raksh*, save); others who cried out: 'Let us eat,' were denominated from that expression, Yaksha" (from *yaksh*, for *jaksh*, eat). This popular etymology of the name, however, would be at variance with the cruel nature of these beings, and it seems, therefore, to have been improved upon in the *Bhāgarata-Purāṇa*, where it is related that Brahmā transformed himself into night, invested with a body; this the Yakshas (q. v.) and Rākshasas seized upon, exclaiming: "Do not spare it—devour it!" when Brahmā cried out: "Don't devour me (*mā mān yakshata*)—spare me! (*rakshata*)." (See F. E. Hall's note to Wilson's *Vishṇu-Purāṇa*, vol. i. p. 82.) The more probable origin of the word *Rakshas*—kindred with the German *Recke* or *Riese*—is that from a radical *rish* or *rish*, hurt or destroy, with an affix *sas*; hence, literally, the destructive being.

RAKOS. See PESTH, *ante*.

RALEIGH, a co. in s. West Virginia, drained by the Kanawha or New river, its e. boundary, and by Coal river and Piney creek; traversed by the Chesapeake and Ohio railroad; 500 sq. m.; pop. '80, 7,367—7,324 of American birth; 71 colored. Surface, rough and mountainous; corn, wheat, hay, and dairy products are the staples. Co. seat, Raleigh Court House.

RALEIGH, the capital of North Carolina, is six miles w. of the Neuse river, near the center of the state; lat. 35° 47' n., long. 78° 48' west. The town is regularly built on an elevated site, with a central park, containing a large domed state-house and broad streets. It contains a court-house, jail, 3 banks, 12 newspapers, 6 churches, deaf and dumb and lunatic asylums, and extensive railway connections. Pop. '60, 4,780; '70, 7,790.

RALEIGH (*ante*), a city in n. North Carolina, capital of the state since 1794, co. seat of Wake co., called the *City of Oaks*; pop. '80, 14,110. It is on the Raleigh and Augusta railroad, and the North Carolina division of the Richmond and Danville railroad, and is the s. terminus of the Raleigh and Gaston. Its 4 principal streets radiate from a central park of 6 acres, shaded by oak trees, in which stands the state-house 166 ft. long by 90 ft. wide, built of granite, 3 stories in height, with a handsome front of massive columns, erected at a cost of \$500,000. A state-house, which contained a statue of Washington by Canova, was burned in 1831. Another costly structure is the U. S. court-house and post-office, of white Salisbury granite. The city contains several educational institutions supported by the different denominations, including the Raleigh female seminary for girls; also public schools for white and colored, the Shaw institute for more advanced colored pupils, and a farm school. It has 3 banks with an aggregate capital of \$700,000; 10 churches, several of them supported by colored people; a geological museum; 2 libraries at the state-house, one a law library of 4,000 vols.; and a state library, 25,000 vols. It is the center of a fertile agricultural region, and is an important cotton market, 40,000 bales of that commodity changing hands here annually; it has also an active dry-goods trade. Its leading industries are the manufacture of iron, tobacco, steam-engines, agricultural implements, lumber, carriages, etc.

RALEIGH, SIR WALTER, the son of Walter Raleigh of Fardel in Devonshire, was b. in 1552 at Hayes, on the coast of that county. In 1568, he was sent to Oxford as a commoner of Oriol college, and though his residence there was brief, gave token of remarkable ability. Only the year after, relinquishing study for adventure, he went to France as volunteer in an expedition in aid of the Huguenots; and some years subsequently we find him serving in the Low Countries in a force sent by queen Elizabeth to assist the Dutch in their patriotic struggle against the Spaniards. Of this earlier part of his career nothing specially remarkable is recorded. In 1579 he made his first venture in the field of activity which through life continued at intervals to attract him, sailing, in conjunction with his half-brother, sir Humphrey Gilbert, with the purpose of founding a colony in North America. The expedition proved unsuccessful, being roughly handled by a Spanish force, and obliged to return in somewhat evil case. During the year following Raleigh held a captain's commission in Ireland, where, in operations against the rebels, he distinguished himself by his courage and conduct. Shortly after his return, he seems first to have attracted the notice of queen Elizabeth, with whom he speedily rose high in favor. The story which attributes the commencement of his relations with her to his graceful gallantry in spreading before her his costly mantle as a carpet, is so well-known, that it need only be glanced at in passing. For some years forward he was constant in his attendance upon the queen, who distinguished him by

employing him from time to time in various delicate offices of trust, and by substantial marks of her favor. The spirit of enterprise was, however, restless in the man; and in 1584, a patent having been granted him to take possession of lands to be discovered by him on the continent of North America, he fitted out two ships at his own expense, and shortly achieved the discovery and occupation of the territory known as Virginia, a name chosen as containing an allusion to the "virgin-queen" herself. Elizabeth also conferred on Raleigh the honor of knighthood. If we except the questionable benefit—with which Raleigh's name remains connected—of the introduction of tobacco into Europe, no immediate good came of the colony; and after some years of struggle, during which he sent out several auxiliary expeditions, he was forced to relinquish his connection with it.

During the years 1587–88, the country being menaced by a Spanish invasion, Raleigh was actively and responsibly occupied in organizing a resistance, and held command of the queen's forces in Cornwall. In the latter year he shared with new access of honor in the series of actions which ended in the defeat and dispersion of the great armada, and was thanked and rewarded for his services. Shortly after (1593), in consequence of an intrigue, resulting in his private marriage with Elizabeth Throckmorton, one of the queen's maids of honor, he incurred her majesty's severe, but only temporary, displeasure. In his banishment from court, he resorted to those schemes of conquest and adventure in the new world which formed one main dream of his life; and, in 1595, headed an expedition to Guiana, having for its object the discovery of the fabled El Dorado, a city of gold and gems, the existence of which in these regions was then generally believed in. Of this brilliant but fruitless adventure, on returning, he published an account. Having been reinstated in the royal favor, he held in 1596 the post of admiral in the expedition against Cadiz, commanded by Howard and the earl of Essex, and was admittedly the main instrument of its success. Also, in the year following, he took part in the attack on the Azores made by the same commanders. In the court intrigues which ended in the downfall of the earl of Essex, he after this became deeply involved; and certain points of his conduct, as notably the sale of his good offices with the queen in behalf of such of the earl's adherents as would buy them, though easily regarded by the current morality of the time, have fixed somewhat of a stain on a fame otherwise so splendid.

With the death of Elizabeth in 1603 ends the brilliant and successful portion of Raleigh's career. Her successor James from the first regarded him with a suspicion and dislike which he was at no pains to conceal. He had besides made powerful enemies—the principal of whom were Cecil and Howard. His ruin was resolved on, and means were soon found to compass it. He was accused of complicity in a plot against the king; and though no jot of evidence of his being any way concerned in it was produced at his trial, a verdict was readily procured, finding him guilty of high-treason. The language of the pro-secutor, attorney-general Coke, was outrageously abusive. He called Raleigh "a damnable atheist," "a spider of hell," "a viperous traitor," etc. Sentence of death was passed, but James did not venture to execute him; and he was sent to the tower, where, for thirteen years, he remained a prisoner, his estates being confiscated, and made over to the king's favorite, Carr, subsequently earl of Somerset. During his imprisonment, he devoted himself to literary and scientific pursuits, his chief monument in this kind being his *History of the World*, a noble fragment, still notable to the student as one of the finest models of our quaint and stately old English style. Certain of his poetical pieces, giving hint of a genius at once elegant and sententious, also continue to be remembered, and are more or less familiar to every one. In 1615 he procured his release, and once more sailed for Guiana. The expedition, from which great results were expected, failed miserably. Raleigh himself, in consequence of severe illness, was unable to accompany it inland, and nothing but disaster ensued. To add to his grief and disappointment, his eldest and favorite son was killed in the storming of the Spanish town of St. Thomas, and he returned to England, broken in spirit and in fortunes. He returned only to die. On the morning of Oct. 29, 1618, in the sixty-sixth year of his age, he was infamously executed, nominally on the sentence passed on him sixteen years before, but really, there is reason to suppose, in base compliance on James's part with the urgencies of the king of Spain, who resented his persistent hostility.

Raleigh was a man of noble presence, of versatile and commanding genius, unquestionably one of the most splendid figures in a time unusually prolific of all splendid developments of humanity. In the art and finesse of the courtier, the politic wisdom of the statesman, and the skillful daring of the warrior, he was almost alike pre-eminent. The moral elevation of the man shone out eminently in the darkness which beset his later fortunes; and the calm and manly dignity with which he fronted adverse fate conciliated even those whom his haughtiness in prosperity had offended. Raleigh's "Life" has been written by Oldys, Cayley (1806), P. F. Tytler (1833); Edwards (1868), St. John (1868); his poems were published by sir E. Brydges (1814); his *Miscellaneous Writings*, by Dr. Birch (1751), and his *Complete Works*, at Oxford (8 vols. 1829).

RÂLE, or RASLES, SEBASTIEN, 1658–1724; b. France; became a Jesuit and teacher of Greek at Nismes; went to Canada as a missionary in 1689; was stationed at the Aben-

aki mission of St. Francis, near the falls of Chaudière, afterward among the Illinois Indians, and in 1695 at Norridgewock on the Kennebec river, Me. He learned the Abenaki language, was successful in converting the Indians, built a church, and had so much influence that the English, believing him to be the cause of the Indian forays upon their settlements, set a price upon his head. In 1705 a party attacked and burned the church; in 1722 another party pillaged his cabin, and burnt the church, which had been rebuilt, but he escaped to the woods; in 1724 another party surprised the town, killed several Indians, and shot Râle. Among the papers which were carried off when he fled was his dictionary of the Abenaki language, which is preserved in the library of Harvard college, and has been printed in the memoirs of the academy of arts and sciences.

RALLENTANDO (Ital. becoming slower), a musical term, abbreviated *rallent.*, or *rall.*, indicating a gradual relaxing or diminution of time.

RALLIDÆ, a family of birds of the order *grallæ*, characterized by a long bill, which is more or less curved at the tip and compressed at the sides, the nostrils in a membranous groove, the wings of moderate length, the tail short, the legs and toes long and slender, the hind-toe placed on a level with the others. To this family belong rails, crakes, gallinules, coots, etc. The toes of some, as coots, are margined with a lobed membrane; but these are by some ornithologists separated from this family (see COOT). Even those rallidæ of which the toes have no marginal membrane, are fitted, by the length of their toes, for walking on mud or ooze. Many of them swim and dive well. Most of them are aquatic, or frequent either fresh-water or salt marshes; but some, as the crakes, are found in dry situations.

RALLS, a co. in n.e. Missouri, bounded on the e. by the Mississippi river, which separates it from Illinois; crossed by the Missouri, Kansas and Texas railroad; about 500 sq. m.; pop. '80, 11,838—11,452 of American birth. The surface is prairie or woodland. The soil is fertile. The principal productions are corn, wheat, and cattle. Co. seat, New London.

RĀMA is, in Hindu mythology, the name common to three incarnations of Vishn'u, of Parasurāma, Rāmachandra, and Balarāma. See VISHN'U.

RĀMĀDAN, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, and every believer is therefore enjoined to keep a strict fast throughout its entire course, from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spittle, are strictly prohibited during that period. Even when obliged to take medicine, the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence of all sorts of enjoyments. The fast of Ramadan, now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of mid-summer. The sick, travelers, and soldiers in time of war are temporarily released from this duty; but they have to fast an equal number of days at a subsequent period, when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious, are expressly exempt from fasting. We may add, that according to some traditions (Al-Beidāwi), not only Mohammed, but also Abraham, Moses, and Jesus received their respective revelations during this month. The principal passages treating of the fast of Ramadan are found in the second Surah of the Koran, called "The Cow."

RĀMĀYANA is the name of one of the two great epic poems of ancient India (for the other, see the article MAHĀBHĀRATA). Its subject-matter is the history of Rāma, one of the incarnations of Vishn'u (q. v., and see RĀMA), and its reputed author is *Valmiki*, who is said to have taught his poem to the two sons of Rāma, the hero of the history; and, according to this legend, would have been a contemporary of Rāma himself. But though this latter account is open to much doubt, it seems certain that Valmiki—unlike Vyāsa (q. v.), the supposed compiler of the *Mahābhārata*—was a real personage; and, moreover, that the Rāmāyana was the work of one single poet—not, like the *Mahābhārata*, the creation of various epochs and different minds. As a poetical composition the Rāmāyana is therefore far superior to the *Mahābhārata*; and it may be called the best great poem of ancient India, fairly claiming a rank in the literature of the world equal to that of the epic poetry of Homer. Whereas the character of the *Mahābhārata* is cyclopædic, its main subject-matter overgrown by episodes of the most diversified nature, its diction differing in merit, both from a poetical and grammatical point of view, according to the ages that worked at its completion—the Rāmāyana has but one object in view, the history of Rāma. Its episodes are rare, and restricted to the early portion of the work, and its poetical diction betrays throughout the same finish and the same poetical genius. Nor can there be any reasonable doubt as to the relative ages of both poems, provided that we look upon the *Mahābhārata* in the form in which it is preserved, as a whole. Whether we apply as a test the aspect of the religious life, or the geographical and other knowledge displayed in the one and the other work, the Rāmāyana appears as the older of the two. Since it is the chief source whence our information of the Rāma incarna-

tion of Vishn'u is derived, its contents may be gathered from that portion of the article VISHN'U which relates to *Rámachandra*. The *Rámáyana* contains (professedly) 24,000 epic verses, or *Stokas*, in seven books, or *Kán'das*, called the *Bálu*-, *Ayodhyá*-, *Aranyá*-, *Kishkínthá*-, *Sundará*-, *Yuddhá*- (or *Lanká*-), and *Uttará-Kán'da*. The text which has come down to us exhibits, in different sets of manuscripts, such considerable discrepancies, that it becomes necessary to speak of two recensions in which it now exists. This remarkable fact was first made known by A. W. von Schlegel, who, in Europe, was the first who attempted a critical edition of this poem; it is now fully corroborated by a comparison that may be made between the printed editions of both texts. The one is more concise in its diction, and has less tendency than the other to that kind of descriptive enlargement of facts and sentiments which characterizes the latter poetry of India; it often also exhibits grammatical forms and peculiarities of an archaic stamp, where the other studiously avoids that which must have appeared to its editors in the light of a grammatical difficulty. In short, there can be little doubt that the former is the older and more genuine, and the latter the more recent, and, in some respect, more spurious text. A complete edition of the older text, with two commentaries, was published at Madras in 1856 (in the Telugu characters, vol. i.-iii.); another edition of the same text, with a short commentary, appeared at Calcutta in two vols. (1860), and a more careful and elegant one at Bombay (1861). Of the later edition, signor Gaspare Gorresio has edited the first six books (vol. i.-v., Paris, 1843-50) without a commentary, but with an Italian, somewhat free, translation in poetical prose (vol. vi.-x., Paris, 1847-58). Former attempts at an edition and translation of the *Rámáyana* remained unfortunately incomplete. The earliest was that made by William Carey and Joshua Marshman, who edited the first two books, and added to the text a prose translation in English and explanatory notes (vol. i.-iii., Serampore, 1806-10; and vol. i., containing the first book, Dunstable, 1808). Another edition, of an eclectic nature, is that by A. W. von Schlegel; it contains the first two books of the text, and an excellent Latin translation of the first book and 20 chapters of the second (vol. i., parts 1 and 2, and vol. ii., part 1, Bonn, 1846). Various episodes from the *Rámáyana*, it may also be added, have at various times occupied sundry editors and translators.

RAMBLA, a market-town of Spain, in the modern province of Cordova, and 23 m. s. of the city of that name, stands on a hill in a district which produces abundantly grain, wine, and oil. Some manufactures of coarse pottery, especially of porous water-coolers, are carried on. Pop. 9,000.

RAMBOUILLET, CATHERINE, Marquise de, one of the most accomplished and illustrious women of the 17th c., was b. at Rome, of Italian parents, in 1588, and received a refined education under the superintendence of her mother, the *marchese di Pisani*. At the age of 12 she was betrothed to a French nobleman, Charles d'Angennes, son of the *marquis de Rambouillet*, who succeeded to the family estates and title on the death of his father in 1611. When the youthful marquise first appeared in the assemblies at the Louvre, she was shocked by the gross corruption of morals and manners that prevailed among the mob of courtiers, and almost immediately conceived the idea of forming a select circle for herself, which should meet at her own house—the famous *hôtel de Rambouillet*. Mmc. de Rambouillet was admirably fitted for presiding at the reunions which have made her name famous in the literary history of France. Handsome and gracious, but free from coquetry and all personal pretensions, her affability, generosity, and steadfast attachment to her friends made her an object almost of worship to those who enjoyed her society. The writers of that epoch are unanimous in the expression of their homage. The characteristic feature of the Rambouillet circle was the intercourse, on terms of equality, of the aristocracy of rank, and the aristocracy of genius. There, for the first time, do we meet with a generous and adequate recognition of the dignity of letters. For fifty years the *salons* of the marquise were hospitably open to the wits, critics, scholars, and poets of Paris, beginning with Malherbe and Racan, followed by that distinguished circle of *beaux esprits* who contributed so much to the formation of the French language and taste—Costar, Sarrazin, Conrart, Patru, Balzac, Segrais, Godeau, Voiture, and Corneille; and closing with the generation who filled up the interregnum from Corneille to Molière, Scarron, Saint-Evremond, Benserade, the *duc de La Rochefoucauld*, etc. Many of the literary *débuts* of celebrated geniuses were made at the *hôtel de Rambouillet*. Here Corneille read his first piece, *Mélite*, and Armand du Plessis, afterward cardinal Richelieu, sustained a *Thèse d'Amour*, and Boileau preached one of his earliest sermons. But the *hôtel* was almost as much renowned for the brilliant and accomplished women who frequented it, as for its crowd of professional *littérateurs*. The names of mademoiselle de Scudéry, of mademoiselle Coligny—afterward comtesse de la Suze—and of the marquise de Sablé, who inspired the *Maximes* of La Rochefoucauld, are among the most distinguished of their time and country; but above them all, as conspicuous by her splendid beauty as by her faultless grace of manner, the center and idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde—the duchesse de Longueville. The combined influence of so many different sorts of *esprit* exercised a profound and lasting influence on the literature and society of the 17th c., and is considered—rightly, as we think—to have developed quite a new art—that of lively, polished conversation, in which France has ever since taken the lead, and has thus placed

itself socially in the front of European civilization. It has been customary to say that the *Précieuses Ridicules* of Molière was aimed at the foibles of the Rambouillet coterie. But this notion has been shown to be entirely groundless. The *Précieuses Ridicules* was actually first performed at the hôtel, and Molière, in the preface to his *Femmes Savantes*, protests against the supposition that he meant to reflect on a circle which he affirmed had every claim to respect. It appears from investigation, that grotesque imitations of the manners and style of the hôtel had, in the course of years, become prevalent both in Paris and the provinces, and that it was these, and not their charming prototype, which were exposed to the satire of Molière. Mme. de Rambouillet died at Paris, Dec. 2, 1665.—See Röderer's *Mémoire pour servir à l'Histoire de la Société polie en France pendant le dix-septième Siècle*; and Victor Cousin's *Jeunesse de Mde. de Longueville, Mde. de Sablé, etc.*

RAMEAU, JEAN PHILIPPE, an eminent French musician, b. at Dijon in 1683, and son of the organist of the Sainté Chapelle there. He showed a genius for music almost from infancy, and with the view of devoting himself to it as a profession, set out for Italy at the age of 18, but proceeded no further than Milan. After traveling through France, and acquiring a considerable reputation as a performer on the organ, he was appointed organist of the cathedral of Clermont, in Auvergne, and wrote while there his *Traité de l'Harmonie*, a work of some note in musical literature, which was published in Paris in 1722. Removing to Paris, he became organist of Sainte Croix de la Bretonnerie, and published various other treatises connected with the theory of music. In 1733, at the mature age of 50, he produced his first opera, *Hippolyte et Aricie*, the drama of which was written by the abbé Pellegrin. It created a great sensation, and Rameau was forthwith elevated to the position of a rival to Lull as an opera composer, musicians being divided in their partisanship of the two artists. Rameau's best opera was *Castor et Pollux*, produced at the académie royale de musique in 1737; it contains one chorus which has hardly been surpassed in the whole range of theatrical music. Between 1733-60 he composed 21 operas and ballets, as well as numerous harpsichord pieces. His works on harmony acquired for him a deservedly high reputation as a musical theorist; he has been called the Newton of musical science. Louis XV. created for him the office of cabinet composer, granted him letters of nobility, and named him a chevalier de St. Michel. Rameau died in 1764.

RAMESESSES, RAMESES, OR RAMSES, the name of several Egyptian monarchs, some of whom were known to the Greek and Roman writers and the chronologists; the name signifies "born of the sun" or the "nascent sun." The Rameses family is supposed to have been of Theban origin, and to have been descended from one of the later queens of the 18th dynasty. The exploits of Rameses are confounded by the Greek and Roman authors with those of Sesostris (see SESOSTRIS), and mingled in the legend of Armais, the Danaus of the Greeks. Rameses is said to have had a great army and navy, and at the head of a force of 700,000 men to have conquered Ethiopia, Libya, Persia, and other eastern nations. Before leaving his kingdom for these distant expeditions, he is said to have appointed his brother Armais or Danans regent of the kingdom, charging him neither to assume the diadem, nor interfere with the royal harem. Rameses then proceeded to conquer Cyprus, Phœnicia, the Assyrians, and Medes. Armais contravened his orders; and Rameses, informed of this by the high-priest, suddenly returned to Pelusium, and resumed the kingdom, expelling his brother, who, fleeing with his daughters, the Danaids, to Argos, established himself in Greece. According to the Roman authors, however, Troy was taken in the reign of Rameses. The walls of the temples of Thebes were said to be covered with inscriptions and scenes recording his conquests and the tributes rendered to him, and these were interpreted to Germanicus by the priests on his visit to Egypt. Such is the account given of a monarch called Rameses by the classical authors. The following are the principal princes and monarchs of this name, found on the monuments of Egypt. 1. A prince or king represented with the royal families of the 18th dynasty in a sepulcher at Thebes.—2. Rameses I., chief of the 19th dynasty, who reigned but a short time, and whose name is found on the monuments of Thebes and the Wady Halfa.—3. Rameses II., or great, who mounted the throne at a very early age, conquered the Khita or Hittites, and other confederate nations of central Asia, in his 7th year, and concluded an extraordinary treaty with the Khita in his 21st year. Other nations, European and African, fell under his sway, and his empire extended far south in Nubia, the ancient Ethiopia, which he governed by viceroys. He erected fortresses and temples in foreign lands, and embellished all Egypt with his edifices. He had two wives, twenty-three sons, and seven daughters, and was finally buried in the Biban-El-Meluk. He is the supposed Sesostris, according to most authors. He reigned 68 years.—4. Rameses III., chief of the 20th dynasty, the Rhampsinitus of Herodotus, called Meriamoun, or beloved of Ammon, who defeated the Philistines, the Mashwash, and the Libyans, carrying on important wars from the 5th to the 12th year of his reign; he also made conquests in the 16th, and seems to have reigned 55 more years. He founded the magnificent pile of edifices of Medinat Habu, embellished Luxor, Gurnah, and other parts of Egypt. Some attribute to him the exploits of the Rameses of the Greek and Roman writers.—5. Rameses IV. reigned a short time, and performed no distinguished actions.—6. Rameses V., of whom inscriptions are found at Silsilis.—7. Rameses VI., whose tomb at the Biban-El-Meluk contains some astronomical records.

from which the date of his reign has been calculated at 1240 B.C.—8-12. Rameses VII., VIII., IX., X., and XI., undistinguished monarchs.—13. Rameses XII., who reigned above 33 years, in whose reign the statue of the god Chons was sent from Egypt to the land of the Bakhten, to cure a princess of the royal family of that court, with which Rameses had contracted an alliance.—14. Rameses XIII., an unimportant monarch.

RAMESSES is also the name of one of the fortresses or treasure-cities built by the Hebrews during their residence in Egypt. The name of this fortress, all-important for the date of the exodus—placed 1491 B.C. by the old chronologers, and 1314 B.C. by Lepsius—is found in the papyri of the British museum in documents of the age of Menephtah, while Rameses III. is represented at Medinat Habu in one of his campaigns marching out of the Magdol of Rameses. The situation of Rameses has much puzzled geographers and commentators, and it has been supposed to be Abaris, Baal-Zephon, Hieronopolis, Pelusium, and Abu-Kescheh. Notwithstanding the opposition to dating fort Rameses in the period of the 19th dynasty, it is now generally admitted to have been constructed at that period. In fact no fort was ever named by the appellation of a prince, it being the prerogative of the monarch to have the fortresses named after him. Nor is it possible to suppose the name Rameses changed for another older name in the Mosaic writing, without impugning the text; and the evident solution of the difficulty is, that the exodus of the Hebrews took place under a king Rameses, at whatever chronological period his reign may have happened.—Exodus i. 11; Lepsius, *Einleit.*; Chabas, *Mélanges*; Brugsch, *Histoire d'Égypte*.

RAMIE, an East Indian name, often used, for the Bœhmeria (q.v.) Nivea.

RAMILLIES, an inconsiderable village of Brabant, Belgium, 13 m. n. of Namur, and 28 m. s.e. of Brussels, is memorable as the place near which one of the most important battles of the war of the Spanish succession was fought, May 23, 1706. In this conflict, the French forces were under the command of marshal Villeroy and the elector of Bavaria, while Marlborough led the troops of the allies. Villeroy, after a battle of three hours and a half, was defeated, with the loss of almost all his cannon, the whole of his baggage, and 13,000 men in killed and wounded. The great result of this victory was that the French were compelled to give up the whole of the Spanish Netherlands.

RAMMELSBERG, one of the Harz mountains, rather less than 2,200 ft. high, and celebrated for its mines, which yield gold, silver, lead, zinc, copper, sulphur, vitriol, and alum. They have been worked, according to tradition, from the year 968; and their possession was for ages a source of strife between the inhabitants of Goslar (q.v.) and the dukes of Brunswick.

RAMISSERAM, or **RAMESWAR**, a small sandy uncultivated island, about 11 m. long and 6 m. broad, in the gulf of Mauar, between the peninsula of Hindustan and Ceylon. It is about a mile from the coast, and separated from the mainland by Pamöan pass. A line of black rocks stretches across the gulf from Ramisseram to Ceylon, known by the name of Adam's bridge. The island is low, and much of it is covered with swamps. It is well watered, and there is a fresh-water lake 3 m. in circuit. On one side is the town of Ramisseram, containing 1000 houses and a famous temple built of huge blocks of granite. It is regarded as a very holy place, and celebrated throughout India as a place of pilgrimage for Hindus, the number annually visiting it being estimated at 30,000. Pamban is the port of the island.

RAMMOHUN ROY, a celebrated Hindu rajah, was born at Bordnan, in the province of Bengal, between 1774 and 1780. In a sketch of his own life, written in 1832, he states that his ancestors were Brahmans of a high order. At home he acquired the usual elements of native education, with some knowledge of the Persian language. At Patna, and afterward at Benares, he studied Sanskrit, and the works written in it, which contain the spirit of Hindu law, literature, and religion. At a very early age he began to compare the evidence for and against the various religious doctrines held by those around him; nor did he except from this investigation those doctrines in belief of which he himself had been brought up. Finding them all repugnant to his vigorous understanding, he boldly acknowledged this fact both to himself and to the world. The result was a quarrel with his father, his family, and his community. He appears, indeed, to have succeeded in converting the understanding of his mother; but it, in its turn, was overcome by her sentiment. "You are right," she said to him, when she was about to set out on a pilgrimage to Juggernaut; "but I am a woman, and cannot give up observances which are a comfort to me." Rammohun Roy spent two or three years of his youth in Tibet, where he excited general anger by denying that the Lama was the creator and preserver of the world. For a long time he had a strong, and perhaps not unfounded, dislike to the English; but becoming convinced that their sway was, on the whole, beneficial to India, his views changed, and he applied himself to the study of the English language. For five years he held the office of revenue collector in the district of Rungpoor. In 1803 his father died, but left him no part of his estate. In 1811, however, by the death of his brother, he succeeded to affluence. "After my father's death," he says, "I opposed the advocates of idolatry with still greater boldness." He published various works in Persian, Arabic, and Sanskrit; the object of the whole being the uprooting of

idolatry. He also issued in English an abridgment of a work called the *Vedant*, giving a digest of the Vedas, the ancient sacred books of the Hindus. Becoming more convinced, as he grew older, of the excellence of the moral theories of Christianity, in 1820 he published *The Precepts of Jesus, the Guide to Peace and Happiness*. It appears from this work, that while he believed in the morality preached by Christ, he did not believe in the divinity of the preacher. He rejected the miracles also, and other portions of the gospels held to be fundamental in the various churches of Christendom. The book, therefore, as was to have been expected, met with severe ecclesiastical censure, the grounds of censure being various and conflicting. In April, 1831, the rajah visited England. The great question of parliamentary reform was then agitating the country. Of the reform bill he wrote, that it "would, in its consequences, promote the welfare of England and her dependencies; nay, of the whole world." His society was universally courted in England. He was oppressed with invitations to attend social parties, and political and ecclesiastical meetings. His anxiety to see everything and to please all led him to overtask himself to such an extent that his health, long failing, at last quite broke down. He died at Bristol, Sept. 27, 1833. The adverse circumstances of his birth were such as might easily have enslaved even his powerful understanding, or still more easily, might have perverted it to selfish ends; but he won his high position by an inflexible honesty of purpose and energy of will.—See Sketch of his Life, written by himself, in the *Athenæum*, No. 310, Oct. 5, 1833; also *Chambers's Edinburgh Journal*, Aug. 2, 1834.

RAMNAD, a t. of British India, in the district of Madura, presidency of Madras, 125 m. n.e. from cape Comorin, and about 5 or 6 m. from the shore of Palk's bay. In the center of the fort is the palace or residence of the zemindar, one of the greatest of his class in the s. of India, his extensive possessions containing more than 2,000 villages, and nearly 300,000 inhabitants. Pop. about 13,000, of whom 6,000 dwell within the fort.

RAMNEGHAH, or **RAMNUGGUR** (Town of God), formerly called Rasalnuggur, a walled town of the Punjab, beautifully situated in an extensive plain on the left bank of the Chenab, 65 m. n.n.w. of Lahore. There is here a ferry across the river, which is 300 yards wide, and 9 ft. deep; but 2 m. lower there is a ford, at which the depth is only 3 ft., when the water is at its lowest. The town is surrounded by walls, and contains 8 well-supplied bazaars. Pop. stated at 11,000.

RAMNEGHAH, or **RAMNUGGUR**, a t. of British India, n.w. provinces, in the district of Benares, and 4 m. s. of the city of that name, on the right bank of the Ganges. Its fort, the residence of the rajah, rises from the banks of the sacred stream by a number of fine ghats or flights of stairs. Pop. '72, 11,953.

RAMOTH-GILEAD, called also Ramoth-Mizpeh, a t. in Gilead, one of the chief cities of Gad, e. of the Jordan. It was a strong fortress, and the key to an important district. It was the last of the places which the Syrians conquered and held. Ahab was killed in attempting to recover it, and his son Joram wounded fourteen years after. Eusebius places Ramoth-Gilead on the river Jabbok, where are the ruins of a town called Jelaad, a different form of the Hebrew Gilead.

RAMP, a sudden upward curve in the hand-rail of a stair.

RAMP, in fortification, is a gradual slope by which approach is had from the level of the town or interior area to the terreplein or general level of the fortifications behind the parapet.

RAMPANT (Fr. literally, "raging"), in heraldry, an epithet applied to a lion or other beast of prey when placed erect on the two hind-legs, with only one of the fore-legs elevated, the head being seen in profile. When the face is turned towards the spectator, the attitude is called *rampant gardant*, and when the head is turned backward, *rampant regardant*. A lion *counter-rampant* is one rampant toward the sinister, instead of toward the dexter, the usual attitude. Two lions rampant contrariwise in saltire are sometimes also said to be counter-rampant.

RAMPART, forms the substratum of every permanent fortification. See **FORTIFICATION**. It constitutes the enceinte, and is constructed immediately within the main ditch by throwing up the soil excavated from it. On the front of the rampart the parapet is raised, and width should be left behind it to allow of guns, wagons, and troops passing freely on the top of the rampart. The height of the rampart is dependent on the relief (height) of the buildings to be defended, and on the positions in the neighborhood which an enemy might assume.

RAMPHAS'TIDÆ. See **TOUCAN**.

RAMPION, *Campanula rapunculus* (see **CAMPANULA**), a perennial plant, a native of Europe, rare in England, with a stem about 2 ft. high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovato-lanceolate and waved. The root is white and spindle-shaped, and was formerly much used for the table, under the name of *rampion* or *ramps*. The plant is now little cultivated in Britain, but is still commonly cultivated in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

RAMSAY, ALLAN, an eminent Scottish poet, was born in the parish of Crawford, Lanarkshire, Oct. 15, 1686. His father was manager of lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. To this maternal descent we may perhaps trace Allan's peculiar frankness and gayety of temperament. In his 15th year (by which time he had lost both of his parents) he was put apprentice to a wig-maker in Edinburgh. He had received the ordinary education of a parish school, and could read Horace, as he says, "faintly in the original." Up to his 30th year, he continued to follow the occupation of a wig-maker; and by this time he had become known as a poet, having issued several short humorous pieces, printed as broad-sides, and sold for a penny each. He had also written (1716-18) two additional cantos to the old Scots poem of *Christ's Kirk on the Green*, attributed to James I. These two cantos gave such genuine pictures of rustic life, and presented such felicitous scenes of broad humor, that it was obvious their author was destined to become the restorer of Scottish poetry. Patronized by the highest and worthiest of the land, Ramsay now abandoned wig-making, and commenced business as a bookseller. His shop was "opposite Niddry's Wynd," and he placed a sign of Mercury over his door. Subsequently, as his success increased, he removed to the Luckenbooths, and deposing Mercury, set up heads of Drummond and Ben Jonson. He also added to his business a circulating library, the first established in Scotland. From 1718, when he opened shop as a bookseller, down to 1755, when he retired to a villa of his own erection, Ramsay's career, worldly and literary, was eminently prosperous. He was careful and industrious, determined, he said, to show the world that *poor'tith*, or poverty, was not "the poet's lot;" and though he was always courting patronage, he never selected a fool for his patron, nor did his pride and vanity as a poet ever withdraw him from business. The following are his principal works: *Tartana, or the Plaid*, 1721; a collected edition of his *Poems*, published by subscription in 1721, by which it is said the poet realized 400 guineas; *Fables and Tales*, 1722; *Fair Assembly*, 1723; *Health, a Poem*, 1724; *The Tea-table Miscellany*, a collection of the most choice songs, Scottish and English, 1724, to which a second volume was published in 1725, a third in 1727, and a fourth in 1740; *The Evergreen*, "being a collection of Scots poems wrote by the ingenious before 1600," published in 1724; *The Gentle Shepherd, a Pastoral Comedy*, 1725, to which songs were added in 1728; a second collection of *Poems* published by subscription, 1728; *Thirty Fables*, 1730. Of most of these publications, numerous editions were called for, no less than nine of the *Tea-table Miscellany* being issued in nine years. One brief cloud overcast the poet's successful career. He entered into a speculation for the encouragement of the drama, and built a theater in Edinburgh, which was almost immediately shut up by the magistrates, in virtue of the act passed in 1737 prohibiting all dramatic exhibitions without special license. This affair was a serious loss to the poet, and subjected him to the annoyance of attacks from poetasters and morose religionists, such as "A Looking-glass for Allan Ramsay," "The Dying Words of Allan Ramsay," "The Flight of Religious Piety from Scotland upon the Account of Ramsay's Lewd Books and the Hell-bred Playhouse Comedians," etc. Allan bore all with Horatian philosophy and indifference; but he addressed a poetical epistle to his friend, Duncan Forbes of Culloden, then lord-advocate, claiming compensation for his losses, or, at least, that he might be "edged into some canny post." This request does not seem to have been complied with, but Allan had amassed a decent competency. The last two or three years of his life were spent in cheerful retirement in the quaint but picturesque house he had built on the north side of the Castle hill, and there he died on Jan. 7, 1758. He had the gratification of seeing his only surviving son, ALLAN RAMSAY (born in 1713, died in 1784), fast rising into distinction as a portrait painter, and esteemed by the most eminent men of his day as an accomplished scholar and gentleman. This second Allan Ramsay had been carefully educated by his father, and sent to Rome to study art. On his return, being introduced to the prince of Wales, afterward George III., he rapidly rose into favor, and in 1767 was appointed principal painter to the king.

The *Gentle Shepherd* of Ramsay is his greatest work, and, indeed, is esteemed as the best pastoral in any language. Its characters are realities, not shadowy Corydons or Phyllises, maundering over crooks, or sleeping to the murmur of bees. It contains faithful transcripts of actual life and feeling, such as the poet had witnessed in his youth on the banks of the Clyde and Glengonar. The poetry, too, abounds in graphic expression and touches of homely nature and arch humor, that to Scotsmen are irresistible, while the plot is skillfully constructed, and brings out rustic character, customs, and superstitions. Some of Ramsay's tales and fables are amusing, but coarse. His songs also are occasionally defective in respect of simplicity and delicacy, though he has made some exquisite additions to our lyrical poetry. In his Jacobite allegory, *The Vision*, he rises into the higher region of inspiration, apparently imitating, and certainly rivaling Dunbar. As an editor, he has been censured for tampering with the works of the old bards, retouching, adding, or retrenching at his pleasure. But he also rescued many choice productions of the elder muse from neglect, and awakened in Scotland a taste for its native literature. A complete edition of his poems with a biography was published by Chalmers (1800; new edition, with essay by Lord Woodhouselee, 1874). Editions appeared in 1854 and in 1870. A monument to Ramsay was erected in Edinburgh in 1865.

RAMSAY, ANDREW CROMBIE, LL.D., b. Glasgow, Scotland, 1814; educated at Glasgow university. In 1841 he was appointed on the geological survey of Great Britain, and in 1845 became director of the undertaking. In 1848 he was made professor of geology at University college; in 1862 president of the geological society, and in 1872 director-general of the geological survey of the United Kingdom and of the museum of practical geology. He is a member of many scientific and philosophical societies in England and America. He has published many papers on geological subjects, and several books, the chief of which is *Physical Geology and Geography of Great Britain* (1878).

RAMSAY, ANDREW MICHAEL, LL.D., Chevalier de, 1686-1743; b. Scotland; educated at the university of Edinburgh; devoting himself chiefly to mathematics and theology. Being skeptical as to the Protestant tenets he visited Fénelon at Cambrai and became a convert to the Roman Catholic faith. His earlier writings obtained for him the position of tutor to the duke of Château Thierry and to the prince of Turenne. In 1724 the Pretender invited him to Rome and intrusted to him the education of his children. After his return to France he was appointed intendant to the prince of Turenne. His writings are remarkable for their purity of style and perfect knowledge of the French language. Of his works in French the best are *Voyages de Cyrus*; *L'Histoire de la Vie de François de Saliguac de la Motte Fénelon*; *Discours sur le Poème Epique*; *Essai Philosophique sur le Gouvernement Civil*; *Histoire de Turenne*.

RAMSAY, DAVID, 1749-1815; b. Penn.; settled as a physician in Charleston, S. C., 1773. He served in the state legislature 1776-83, was a surgeon in the continental army, and a member of the council of safety. He was taken prisoner at the capture of Charleston in 1780, and confined for 11 months in St. Augustine. He was a member of congress 1782-86, and its president for one year. He was shot by a lunatic against whom he had testified. Among his works are a *History of the Revolution in South Carolina*, 1785; *History of the American Revolution*; and *Universal History Americanized*, 1816-19.

RAMSAY, EDWARD BANNERMAN, LL.D., 1793-1872; b. Scotland; graduated at St. John's college, Cambridge, in 1815; ordained in the church of England; was curate in Somersetshire for seven years; in 1830 was minister of St. John's church, Edinburgh; in 1841 dean of the Reformed Episcopal church of Scotland. Among his productions, besides lectures and sermons, are *Reminiscences of Scottish Life and Character*; *Manual of Catechism*; *Diversities of Christian Character*; *The Canon Law of the Episcopal Church of Scotland as understood in 1860*; *Christian Responsibility*; *Pulpit Table Talk*.

RAMSAY, NATHANIEL, b. Md.; brother of David the historian; educated at the college of New Jersey, where he graduated in 1767. He joined the revolutionary forces at the outbreak of war, became a col., and distinguished himself at the battle of Monmouth, where his regiment saved the American forces from a complete rout. At the siege of Charleston he was made a prisoner. He was a delegate from Maryland to the congress of 1785.

RAMSDEN, JESSE, a celebrated instrument-maker, was b. at Salterhebble, near Halifax, Yorkshire, in 1735. He received a good education, and, after being engaged as a cloth-worker, and become (1762) a working engraver and divider in London, and having married Dollond's (q.v.) daughter, received, as her dowry, a share in his father-in-law's patent for achromatic telescopes. The sextants of his time were very imperfect, being untrustworthy within 5' of a degree, and Ramsden succeeded in reducing the possible error to within 30". His skill thus shown, and the cheapness of his instruments (two-thirds of the price charged by other makers), soon created such a demand as tasked his utmost energy to meet. To increase the amount and improve the quality of the work done by his men, he introduced the principle of the division of labor, besides inventing a dividing-machine, which could graduate instruments much more rapidly and accurately than could be done by hand. For this invention he received from the board of longitude a premium of £615. He constructed the theodolite used by gen. Roy (q.v.), and also telescopes for the observatories of Blenheim, Mannheim, Dublin, Paris, and Gotha, and mural quadrants for those of Padua and Vilna, the accuracy of all of which was a matter of admiration and delight among astronomers. He was one of those who strongly recommended the introduction of the mural circle in place of the quadrant (q.v.), and he constructed two of the former instruments for the observatories of Palermo and Dublin. The minor scientific instruments invented or improved by him are also numerous. He died at Brighton, Nov. 5, 1800, leaving a moderate fortune, a large portion of which was, in accordance with the terms of his will, divided among his workmen. Ramsden was a member of the royal society, a fellow of the imperial academy of St. Petersburg, and the possessor of a Copley medal (the gift of the royal society).

RAMSEY, an unorganized co. in n.e. Dakota; about 1300 sq. miles.

RAMSEY, a co. in e. Minnesota, bounded on the s. by the Mississippi river; on the St. Paul and Manitoba, the Chicago, Milwaukee and St. Paul, the St. Paul and Duluth, the St. Paul, Stillwater and Taylor's Falls, the Chicago, St. Paul and Minneapolis, and the St. Paul and Sioux City railroads; about 155 sq. m.; pop. '80, 45,915-29,331 of American birth. The surface is prairie or woodland, and contains many lakes. The

soil is fertile. The principal productions are corn, wheat, hay, and oats. Co. seat, St. Paul.

RAMSEY, a t. in the isle of Man, lying 16 m. n. of Douglas, and which, from the beauty of its situation and salubrity of its climate, is rapidly becoming a favorite resort of tourists and pleasure seekers. It stands on the margin of a spacious bay, and has a background of lofty and well-wooded hills. The anchorage in the bay is good, and the waters abound in mackerel, herrings, salmon, and other fish. An extensive ship-building yard has recently been opened here, which gives occupation to about 300 men. A public promenade and inclosure on the foreshore have been made, and extensive harbor-works erected. Steam-packets run from Ramsey to Liverpool and to Whitehaven regularly all the year. Pop. '71, 3,934.

RAMSGATE (*Rium's Gate*; *Rium* is the British name of Thanet), a sea-port, market t., and favorite watering-place in the county of Kent, in the s.e. of the isle of Thanet, 97 m. e.s.e. of London by railway. Anciently it was a small fishing-village; but it began to increase in importance about the beginning of the 18th c., when a number of its inhabitants opened up a successful trade with "Russia and the east country." The recently built portion of the town consists of well-arranged streets, crescents, and terraces; and the older part is situated in a natural depression or cutting in the chalk-coast, opening out toward the sea, and called in this district a "gate" or "stair." Ramsgate, as a watering-place, is slightly more aristocratic than Margate (q.v.); and during the season, which lasts from the middle of summer to the end of autumn, the charges are very high. At the height of the season the population of Ramsgate is increased to above 20,000. The climate is much more bracing than that of the southern coast, and exercises a salutary influence in cases of scorbutic disorder. The harbor of Ramsgate—40 acres in extent, and inclosed on the e. by a splendid pier 3,000 ft. in length, and on the w. by another pier 1500 ft. long—serves as a harbor of refuge for the downs. About $1\frac{1}{2}$ m. w. of Ramsgate is Osengall hill, on which a number of Saxon and several Roman graves have been recently discovered, and a large number of most interesting relics, as spear-heads, coins, ornaments in silver, etc., armor, glass and amber beads, etc., found. (See Wright's *Wanderings of an Antiquary*.) Ship-building and rope-making are here carried on, and coal is imported. In 1875 337 vessels, of 29,550 tons, entered the port, and 104, of 6,386 tons, cleared. Pop. '71, 14,640.

RAMSHORNS, in fortification, are semicircular works of low profile in the ditch, which they sweep, being themselves commanded by the main works. They were invented by M. Belidor, a great French engineer, and, when used, take the place of *tenailles* (q.v.).

RAMSKIN, a species of cake, which consists of grated cheese of some dry kind, such as parmesan or the white hard English varieties, incorporated with dough as prepared for fine puff-pastry; then rolled out, and cut into shapes, glazed with white of egg, and baked for a quarter of an hour. It is usually eaten hot. This dish is said to have been invented at Croxeth hall, the seat of lord Sefton, whence it is sometimes called "Sefton fancy."

RAM-TIL, *Guizotia oleifera*, a plant of the natural order *compositæ*, suborder *corymbifera*, a native of the East Indies and Abyssinia, much esteemed for the bland oil which is obtained from the seeds, and which is employed for the same purposes as olive oil. The ram-til is extensively cultivated in India, chiefly in Mysore, and to some extent also in Abyssinia.

RAMUS (Latinized form of *La Ramée*). PIERRE, an illustrious French "humanist," was the son of a poor laborer, and was born at the village of Cuth, in Vermandois, in 1515. His thirst for knowledge was so great, that twice before he had reached his 12th year he traveled on foot to Paris, with the hope of getting into some school there, but the misery of want twice drove the brave boy home again. In his 12th year, however, he got a situation as servant to a rich scholar at the collège de Navarre; and by devoting the day to his master, obtained the night for study, and made rapid progress. The method of teaching philosophy then prevalent dissatisfied him, and he was gradually led to place a higher value on "reason" than on "authority," contrary to the mental habit of his time. His contempt, indeed, for "authority" blinded him (as is often the case with a young reformer) to what truth "authority" might contain, and when taking his degree of M.A., in his 21st year, he maintained the extravagant thesis that "all that Aristotle had said was false" (*quæcunque ab Aristotele dicta essent, commentitia esse*). It says a great deal for the ability he showed on this occasion, that his judges, although themselves Aristotelians, were compelled to applaud him. Immediately after, Ramus became a teacher in the collège du Mans, and along with two learned friends opened a special class for reading the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to "reform;" and no one acquainted with his system will deny that many of his innovations were both rational and beneficial. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Dialecticæ Partitones*) appeared in 1543 it was fiercely assailed by the doctors of the Sor-

bonne, who managed to get it suppressed by a royal edict, and even barbarously demanded that its author should be sent to the galleys. But Ramus had (at this time) two powerful friends, cardinals Charles de Bourbon and Charles de Lorraine, who protected him from personal injury, and through whose influence he was, in 1545, appointed principal of the collège de Presles, which he raised from a condition of decay to the most splendid prosperity. In 1551 cardinal Lorraine succeeded in instituting for him a chair of eloquence and philosophy at the collège Royal; and his inaugural address (*Pro Philosophica Disciplina*, Par. 1551) is reckoned a masterpiece of the kind. He devoted the first eight years of his teaching to the first three of the "liberal arts" (grammar, rhetoric, and logic), which he called elementary or exoteric, and published three grammars successively, Greek, Latin, and French. He also mingled largely in the literary and scholastic disputes of the time, and, on account of his bustling activity, came under the satire of Rabelais. But though Ramus had innumerable adversaries, he might have defied them all, so great was his influence at court, had his love of "reformation" not displayed itself in "religion" as well as in logic. In an evil hour (for his own comfort) he embraced Protestantism. He had long been suspected of a leaning that way, and, as we have seen, his intellect was by nature scornfully rebellious toward the *ipse dixit* of "authority;" but he had for years decently conformed to the practices of the Catholic cult, and it was only after cardinal Lorraine, in reply to the conference of Poissy (1561), frankly admitted the abuses of the church and the vices of the clergy, that he ventured formally to abjure the older faith. The outbreak of the religious wars in France plunged him into the dangers of the time, and he finally perished in the fatal massacre of St. Bartholomew, Aug., 1572. It is believed that he was assassinated at the instigation of one of his most violent and persistent enemies, Charpentier, rector of the collège de Presles.

Ramus holds a most honorable place in the list of intellectual reformers. His assault on scholasticism as a *method of thinking* is vigorous, and, on the whole, well directed; his exposure of its puerile and useless subtleties is thorough, and entirely in accordance with later criticism. In his contempt for the illiterate worship of Aristotle, in his admiration of Plato and of the ancient orators and historians, he ranks (though late) with the scholars of the renaissance; but in his assertion of "reason" as the supreme criterion of truth, he must be regarded as the forerunner of Descartes and the modern world. His system of logic, by which perhaps his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but (like every pre-Baconian system) it fails to realize the supreme importance of the inductive method. What strikes one most, however, in Ramus is not so much his particular achievements as his universal intellectual activity. He was the first mathematician of his age in France, and wrote treatises on arithmetic, geometry, and algebra, which were text-books for 100 years; he was among the earliest adherents of the "Copernican" system of astronomy, and in natural philosophy avowed himself an enemy to hypothesis and abstractions; rhetoric, morals, theology, all engaged his pen, and he seldom handled a subject which he did not to some degree elucidate. His followers were a widespread and for long a powerful body of thinkers and teachers. France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain, had their *Ramists*, as they were called, and they have disappeared chiefly because their tendencies are embraced in the broader and more critical methods of modern scientific inquiry. A list of his writings is given in the *Nouvelle Biographie Universelle*, article "Ramus."—See Waddington's *Ramus, sa Vie, ses Ecrits, et ses Opinions* (Paris, 1855); E. Saisset's *Les Précurseurs de Descartes* (Paris, 1862); and C. Desmazes's *P. Ramus, Professor au Collège de France, sa Vie, ses Ecrits, sa Mort* (Paris, 1864).

RA NA AND RA NIDAE. See FROG.

RANCE, ARMAND JEAN LE BOUTHELIER DE, the well-known founder of the reformed order of La Trappe (see TRAPPISTS), was b. Jan. 9, 1626, at Paris, where he was educated. Having taken his degree in the Sorbonne with great applause, and embraced the ecclesiastical profession, he soon became distinguished as a preacher, and through the favor of cardinal Richelieu obtained more than one valuable benefice. He succeeded, while yet a young man, to a large fortune, and for a time, notwithstanding his clerical character, was carried away by the gayety and dissipation of Parisian life. After a time, however, having forfeited the favor of cardinal Mazarin, and being deeply moved by the death of a lady, the duchess de Montazon, to whom he was much attached, he withdrew from Paris, and after a time resolved to sell all his property, to distribute the proceeds among the poor, and to devote himself exclusively to the practice of piety and penitential works. Finally, he resigned all his preferments (of which, by the abusive practice of the period, he held several simultaneously), with the exception of the abbacy of La Trappe, to which convent he retired in 1662, with the intention of restoring the strict discipline of the order. The history of the reforms which he effected will be found under the head TRAPPIST. He lived in this seclusion for 33 years, during which he published a large number of works, chiefly ascetical. The only remarkable event of his literary life was his controversy with Mabillon, in reply to his *Etudes Monastiques*, on the subject of the studies proper for the monastic life. Rancé's

work is in 4to, 1692. In his youth, he had edited *Anaereon*, in one volume, octavo (Paris, 1639), with a dedication to cardinal Richelieu. He died Oct. 27, 1700.

RANCHE'ROS (from the Spanish *ranch*o, comradeship) is the name given in Mexico to a mixed breed of Spanish and Indian blood, who inhabit the country, and may almost be said to live in the saddle from their youth, are splendid riders and hunters, and form the bravest part of the Mexican army—its irregular cavalry. The importance of their services was seen in the wars with the United States. The Rancheros are lank in frame, with brown weather-stained faces and muscular limbs, hardy, temperate, and always ready for the boldest enterprises. They practice polygamy.

RANCIDITY. See OILS AND FATS.

RANDALL, HENRY STEPHENS, LL.D., 1811-76; b. N. Y.; graduated from Union college, 1830; studied law and was admitted to the bar, but never engaged in active practice. He interested himself in agriculture and education, was associate editor of Moore's *Rural New Yorker*, and in 1851 was made secretary of state and superintendent of public instruction of New York. He published pamphlets on sheep-raising, educational papers, and a life of Jefferson (1857).

RANDALL, SAMUEL J., b. Philadelphia, 1828; received an academic education, and engaged in mercantile pursuits. He was for four years a member of the Philadelphia city councils, and in 1858 was elected to the state senate. He was elected a member of the U. S. house of representatives in 1863, and, taking his seat in the 38th congress, has continued in congress from that time forward, and was chosen speaker of the house at the last session of the 44th congress, and again for the 45th congress. At the beginning of the war of the rebellion, he enlisted as a private soldier in the volunteer army, and went to the front with his company; and while serving under col. Geo. H. Thomas was re-elected to congress.

RANDAZZO, a t. of Sicily, in the province of Catania, at the base of mount Etna, and 8 m. n. by w. from its summit, on the Cantara. It crowns the summit of a low cliff of lava, and ascends the slope above, with brown battlemented walls and Norman towers, so mediæval in its whole appearance, that it has been likened to "a town of the middle ages preserved as a curiosity." Randazzo is believed to have been founded by the Lombard adventurers who assisted count Roger in his conquest of Sicily. Pop. '71, 7,945.

RANDERS, a t. in Jutland, chief town of the *Amt* or bailiwick of the same name, is situated on the Guden, at its entrance into the Randers-Fiorde, 20 m. from the mouth of the latter in the Cattegat. Though still fortified, it has much declined from its early *prestige* and importance. Brewing, distilling, and the manufacture of gloves, which are in high repute, and of stockings and cloth, are carried on. Pop. '70, 11,354.

RANDOLPH, a co. in e. Alabama, adjoining Georgia; drained by the Tallapoosa and Little Tallapoosa rivers; about 690 sq.m.; pop. '80, 16,575—3,420 colored. The surface is uneven, and heavily timbered. The soil is fertile. The principal productions are wheat and corn. Co. seat, Wedowee.

RANDOLPH, a co. in n.e. Arkansas, bordering on Missouri; drained by Big Black, Spring, and other rivers; traversed by the Cairo and Fulton railroad; 1000 sq.m.; pop. '80, 11,724—11,633 of American birth, 627 colored. The surface is broken, heavily wooded, and fertile; corn, cotton, pork, and cattle are the staples. Limestone is found. Co. seat, Pocahontas.

RANDOLPH, a co. in s.w. Georgia; drained by Pataula and Ichawaynochaway creeks; traversed by the Southwestern railroad; about 475 sq.m.; pop. '70, 10,561—5,477 colored. The surface is level. The soil is fertile. The principal productions are cotton and corn. Co. seat, Cuthbert.

RANDOLPH, a co. in s.w. Illinois, bounded by Missouri, and on the s.w. by the Mississippi river; drained also by the Kaskaskia river; intersected by the Iron Mountain, Chester and Eastern railroad; 580 sq.m.; pop. '80, 25,691—21,886 of American birth. The surface is hilly, heavily wooded, and fertile; wheat, hay, oats, corn, and pork are the staples. Bituminous coal and limestone are found. Co. seat, Chester.

RANDOLPH, a co. in e. Indiana, bounded by Ohio on the e.; drained by White, Whitewater, and Mississinewa rivers; traversed by the Pittsburg, Cincinnati and St. Louis and other railroads; 480 sq.m.; pop. '80, 26,437—25,898 of American birth. The surface is level, heavily wooded, and fertile; corn, oats, wheat, pork, and cattle are the staples. Co. seat, Winchester.

RANDOLPH, a co. in n. central Missouri; drained by Chariton river and branches of Salt river; traversed by the St. Louis, Kansas City and Northern, and a division of the Missouri, Kansas and Texas railroads; 440 sq.m.; pop. '80, 12,751—12,302 of American birth, 2,814 colored. Surface, a very fertile prairie; oats, corn, sorghum, wool, and butter are staples; tobacco is raised in very large quantities; coal and limestone are found. Co. seat, Winchester.

RANDOLPH, a co. in w. central North Carolina; drained by the Uharce and Deep rivers; about 760 sq.m.; pop. '80, 20,836—3,077 colored. The surface is varied, heavily

timbered, and contains gold and quartz. The soil is fertile. Corn, wheat, and live stock are the principal productions. Co. seat, Ashborough.

RANDOLPH, a co. in e. West Virginia, watered by the Cheat river, the Dry, Glade, and Laurel forks of the Cheat, and Tygart's Valley river; intersected by Cheat mountain and other ridges of the Alleghenies; about 1075 sq.m.; pop. '80, 8,102—7,632 of American birth, 111 colored. The surface is uneven and heavily timbered. The soil in the lowlands is fertile. The principal productions are corn, wheat, oats, and hay. Co. seat, Beverley.

RANDOLPH, a t. in e. Massachusetts, incorporated 1793; 15 m. from Boston on the Old Colony railroad; pop. '80, 4,027. It is regularly laid out with many old shade trees; has an elegant town-house, 3 churches, 1 chapel, 1 newspaper, a public library, and library building of Quincy and Randolph granite, given by the heirs of col. Royal Turner. It has a national bank, public schools, and a high-school, supported in the main by a bequest of Amasa Stetson. Its manufactures are important. It has several very large boot and shoe factories and woolen mills.

RANDOLPH, EDMUND, 1753-1813; b. Va.; nephew of Peyton. He sided with the whigs, and was disinherited by his father, a bitter royalist. In 1775 he was a member of Washington's staff, and the next year sat in the Virginia convention in May. He was a member of the continental congress 1779-83, and of the constitutional convention of 1787. He proposed in that body the so-called Virginia plan, but would not sign the new constitution. He was, however, in favor of its adoption in the Virginia convention called to act upon it. He was governor of Virginia in 1788, attorney-gen. 1788-90, and in 1794 became Jefferson's successor in the state department. He resigned in Aug., 1795, being suspected of an intrigue with the French minister.

RANDOLPH, PEYTON, 1723-75; b. Va.; second son of sir John Randolph. After graduating at William and Mary college, he completed his education in England, and on his return was made king's attorney gen. for the colony; in 1748 was a member of the house of burgesses, and was chairman of a committee to revise the Virginia code of laws. In 1764 he drew up the address from the burgesses to the king, protesting against the passage of the stamp-act, and was conspicuous in bringing about the first Philadelphia congress, and in all the movements which brought on the revolution. In 1774 he was president of the first colonial congress, also a delegate in the following year; was re-elected president, again served as speaker of the house of burgesses of Virginia, and shortly after his return to congress died suddenly of apoplexy.

RANDOLPH, JOHN, OF ROANOKE, an American statesman, was born at Cawsons in Chesterfield co., Va., June 2, 1773. He was descended from an ancient and wealthy family, and boasted that the Indian princess Pocahontas was one of his ancestors. Educated at Princeton and Columbia colleges, he embraced the profession of the law, and in 1799 was elected to congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity, and for 30 years was more talked and written of than any American politician. Tall and meager, peculiar in dress and manners; he was described as a strange mixture of the aristocrat and the Jacobin. He was the democratic leader of the house of representatives, but quarreled with Jefferson, and opposed the war of 1812, and the Missouri compromise, and stigmatized the northern members who voted for it as "doughfaces." In 1822 and 1824 he visited England, where his eccentricities attracted much notice. In 1825 he was chosen United States senator from Virginia, and in 1830 appointed minister to Russia. By his will, he manumitted 318 slaves, and provided for their maintenance in a free state. He died in Philadelphia, June 24, 1833. See *Life of John Randolph*, by Garland (2 vols., New York, 1850).

RANELAGH, a village forming part of the suburb of Dublin, is situated 2 m. s. from the center of the city. It consists of one principal street with a square, but is surrounded by villas. Pop. '71, 3,209.

RANGE, in gunnery, is the distance between a point on the ground vertically below the muzzle of the piece and the point on the same level at which the projectile touches in its descent. The point-blank range is when the piece is fired in a horizontal position; the range then increases with the elevation; and if the air opposed no resistance, the greatest range would be attained with the piece elevated at an angle of 45°; but in practice this angle is found to be, on an average, a little over 30°. As the resistance of the atmosphere increases as the square of the velocity of the shot, being also in the direct ratio of its front section, while the momentum is as the velocity multiplied by the weight; it follows that a heavy shot should have a greater range than a light one; and that of two shots of the same weight, an elongated cylinder of small diameter will have a longer range than a spherical ball of greater diameter. On the other hand, from the rapid increase in a duplicate ratio of the resistance, as compared with the initial velocity, the range only increases to a certain point, in consequence of a more rapid flight of the projectile. The longest range yet attained has been by sir Joseph Whitworth with a 9-inch rifled gun, with which he sent a bolt a distance of 11,243 yards, or 6 miles 683 yards.

RANGELEY LAKES, a series of lakes in n.w. Maine, in the great lumber region of Franklin and Oxford counties, forming a portion of the most picturesque scenery in the state. The chain consists of a number of distinct bodies of water connected by

small streams. The most remote, Oquossuc or Rangeley lake, 1511 ft. above the level of the sea, is thus connected with Umbagog, partly in New Hampshire, 1256 ft. above the sea, making a distance of nearly 50 m., comprising a water surface of 80 sq. miles. The lakes abound in salmon and other delicate fish, two species of trout, weighing 10 lbs., being found in these waters only, and secured with little trouble. They are designated as Rangeley, Cupsuptic, Mooselucmaguntic, Molechunkamunk, or Upper Richardson, Lower Richardson, and Umbagog, and are a favorite resort for artists, tourists, and sportsmen.

RANGOON, the principal sea-port and chief t. of Pegu (q. v.), is built on the left bank of the Ragoon river, the eastern branch of the Irrawaddy, at the distance of 26 m. from the sea, in lat. 16° 42' n., and long. 96° 13' east. Rangoon was founded or rebuilt by the great Alompra in 1755. The British flag was first planted in the town, May, 1824, when the Anglo-Indian troops took possession of it at the commencement of the first Burman war. The second Burman war began with the bombardment of Rangoon, April 11, 1852, and it was captured April 14 by the united forces of Bengal and Madras. At the close of the contest Pegu was annexed to British India, and Rangoon became a part of the same territory. Pop. '69, 87,553; of whom 1627 were Christians, 11,997 Mohammedans, 5,998 Hindus, 62,054 Burmese, and 5,887 others. Pop. '72, 98,745. A great change has taken place in Rangoon under the dominion of the British, and large sums have been expended on its improvement. Capital roads and streets now intersect every part of the town. The native town is of a very mean appearance, but many substantial buildings of brick or stone have been erected by the European inhabitants. Rangoon possesses a government naval yard, and a patent slip for repairing ships.

Rangoon is a stronghold of Buddhism, and on every side are seen gigantic monuments that from age to age have been erected by the followers of Gau-ta-ma; pagodas, temples, images, wonderful in their vastness and grotesque splendor. Of these, the most notable is the famous *Shoay Dagon*, or golden dagon dagoba, or shrine, the foundation of which is said to have been laid 2,300 years ago. It lies about 2. m. n. of the town, on elevated ground, and the area on which it stands is 800 ft. square. The dagoba itself is a stupendous mass of solid masonry, tapering gradually from an octagonal base of 1355 ft. to a spire of small circumference, which is surmounted by the sacred *tee*, or umbrella of open iron-work. The whole building is one dazzling blaze of gold, and altogether forms a most magnificent object, its magnitude and massiveness being very remarkable. This celebrated monument derives its peculiar sanctity from being the depository, according to Burman tradition, of relics of the last four Buddhas—viz., the staff of Kan-tha-than, the water-dipper of Gau-na-gon, a garment of Ka-tha-pa, and eight hairs from the head of Gau-ta-ma. The shrine is surrounded by numerous temples, containing colossal images of Gau-ta-ma, richly gilt, and sitting in solemn conclave, cross-legged, like so many tailors at a Quaker's meeting.

Rangoon, possessing a continuous water-communication with the upper provinces and the Burman kingdom, is very favorably situated for internal as well as for foreign commerce. There are 5 light-houses on the Burmese coast to guide vessels to the port. Teak-timber and rice are the principal exports by sea, but they also include cotton,utch, hides, ivory, jade, kerosene, petroleum, precious stones, shellac, and tobacco. The imports by sea consist of betel-nut, cotton twist, cotton piece goods, crockery, cutlery, hardware, silk and woolen piece goods, raw silk, spirituous liquors, and wines. The annual value of exports from Rangoon amounts to above £2,500,000, and this sum is exceeded by the value of the imports. The town is fortified and garrisoned. An English newspaper is published here.

RANK. *Army rank* is somewhat confusing from its varieties, and from the fact that the same officer may hold at once three different ranks. The first and only rank up to the grade of capt. is *regimental* or *substantive* rank. Above this, officers may advance in two ways: first up to the rank of lieut.col. by substantive or regimental rank; second, up to col. by obtaining rank in the army, generally called *brevet rank*, and above that by army rank through the several grades of general officers. In his regiment, the officer holds only his regimental rank, whatever his brevet rank may be; but among officers of the army generally he takes precedence according to his brevet rank. In describing an officer who has brevet rank his regimental rank is placed first—as, capt. and brevet lieut.col. Brown, which means that an officer named Brown, who holds rank in a regiment as capt., has for his services been promoted in the army to be lieut.col. Officers of the foot-guards have higher rank in the army. See FOOT-GUARDS. Another class of rank is relative rank, which attaches to certain officers. Thus capt. Brown aforesaid, in addition to regimental rank as capt., and army rank as lieut.col., may possibly hold a staff appointment which confers on him the relative rank of col. *Local rank* is a common expedient for advancing comparatively junior officers to important duties, a higher rank than that properly held in the army being assigned to an individual within certain geographical limits, as in the East Indies, the Crimea, etc. *Temporary rank* is similarly limited by time, and is conferred usually for the period during which some appointment is held, as the officer acting as director of ordnance ranks as maj.gen. while so employed. *Honorary rank* carries neither duty nor emoluments; it is commonly given to the amount of one step to an officer who has served the time necessary

for retirement; thus, a capt., after thirty years' service, may retire (on the pay of capt.) with the honorary rank of maj. Officers who have quitted the army are also allowed to retain as honorary the last rank they held.

Navy rank has no irregularities; it is plainly what it professes to be. The marines rank with corresponding grades in the army, and their and the army rank, as compared with the navy, will be shown under **RELATIVE RANK** (q. v.).

RANK AND FILE, the body of soldiers constituting the mass of the army, and including corporals, bombardiers, and privates. Rank and file means literally the lines of men from side to side, and from front to back—a rank being a row of men standing side by side, and a file of soldiers a line of men standing one behind another. The strength of a force is reckoned by its rank and file; the non-commissioned and commissioned officers forming the supernumerary ranks charged with the direction of the mass.

RANKÉ, LEOPOLD, one of the most distinguished modern historians of Germany, was b. at Wiehe, in Thuringia, Dec. 21, 1795, and educated for a school-master. In 1818 he was appointed rector of the gymnasium at Frankfort-on-the-Oder; and in 1824 published at Berlin his first work, *Geschichte der Roman. und German. Völkerschäften von 1494-1535*. It attracted considerable notice; and in the following year he was called to Berlin as extraordinary prof. of history at the university, where his lectures soon began to be numerously attended. About this time his attention was directed to the historical value of the reports sent home by the Venetian ambassadors at the different European courts during the 16th and 17th centuries, and the result of his studies and investigations among these was his *Fürsten und Völker von SüdEuropa im 16 und 17 Jahrh.* (Berl. 1827), in which the affairs of Turkey and Spain are especially handled. Immediately after the publication of this work he commenced a four years' tour through Europe, for the purpose of examining the archives of the different nations. The fruit of his varied researches partly appeared in his *Serbische Revolution* (Berl. 1829); *Verschwörung gegen Venedig im J. 1688* (Berl. 1831), and *Vorlesungen zur Geschichte der Ital. Poesie* (Berl. 1837); but a much greater and more valuable performance than any of these was *Die Röm. Päpste, ihre Kirche und ihr Staut im 16 und 17 Jahrh.* (3 vols., Berl. 1834-36; 3 ed., Berl. 1844-45), a work which, on account of its important conclusions regarding the character and policy of the papacy, many of which it may be said to have almost placed beyond controversy, was not only received with unbounded applause in Germany, but was translated again and again in Holland, England, France, and America, and may be regarded as one of the most widely-circulated and influential histories of modern times. It was followed up by his *Deutsche Geschichte im Zeitalter der Reformation* (6 vols. Berl. 1839-47), considered in Germany his most finished and thorough production, and in the composition of which he was enabled to avail himself of many documents never before published or made use of. In a still higher degree than in his earlier writings, we find displayed here his skill in grouping events together in a vivid and intelligent manner, placing them before the eye of the reader in their whole significance, with all their causes, relations, and consequences. Ranké's next effort, *Neun Bücher Preuss. Geschichten* (1847-48), remodeled and re-issued in 1875 under the title *Genesis des Preussischen Staates*, may be regarded as continuing his history of Protestantism, and was worked up from the Prussian historical archives, opened to literature for the first time. The stormy period of 1848 found him in the Frankfort parliament; but he did not acquire any distinction in that arena of babbling and incompetent patriots, and soon betook himself again to more familiar and more valuable labors. His *Franz. Geschichte vornehmlich im 16 und 17 Jahrh.* (1852-57) is an admirable work, full of new information and enlightened views; and his *exposé* of the reign of Louis XIV. is put, even by French critics, on a level with that of Voltaire. Still later are his *Englische Geschichte vornehmlich im 16 und 17 Jahrh.* (1859-67, Eng. trans. 1875); *Die Deutschen Mächte und der Fürstenbund*; and his memoir of *Hardenberg* (1877). A collected edition of his works was begun in 1874. Ranké became ordinary prof. in 1834, and was ennobled in 1866. He has trained a numerous body of historical students.—Ranké has three brothers, **FRIEDRICH HEINRICH RANKÉ** (born 1797), **KARL FRIEDRICH RANKÉ** (born 1802), and **ERNEST RANKÉ** (born 1814), who have also risen to eminence as churchmen and scholars.

RANKIN, a co. in s. Mississippi having the Pearl river for its w. boundary and the Strong river on the s. e.; 800 sq. m.; pop. '80, 16,752—16,791 of American birth, 9,560 colored. It is intersected centrally by the Vicksburg and Meridian railroad. Its surface is generally level, with dense forests of oak, hickory, beech, and pine upon the hills, and groves of magnolia, beech, and elm along the water-courses. Its soil is fertile, adapted to the raising of cotton, corn, rice, oats, wool, and live stock. Co. seat, Brandon.

RANKINE, WILLIAM JOHN MACQORN, 1820-72; b. Edinburgh; studied with his father a retired lieutenant of the rifle brigade, attended lectures in the university of Edinburgh, and afterward studied natural philosophy. In his youth he was author of a remarkable paper on the use of cylindrical wheels for railway carriages. In 1841-51 he was employed on the railways of Scotland as a civil engineer. He made an investigation into the theory of molecular vortices, an account of which he published in 1849, and was elected a fellow of the Royal Society of Edinburgh. He published in the *Philosophical Magazine* a paper on the *Centrifugal Theory of Elasticity as applied to Gases and Vapors*,

In 1843 he was elected an associate of the institution of civil engineers. Other articles appeared in the scientific journals from his pen. He resided a year in Glasgow, and addressed the philosophical society there; became fellow of the Royal society of London, and gave a course of lectures in the university at Glasgow; was elected regius professor of civil engineering in that institution. He was a contributor to the *Encyclopedia Britannica*; and in 1869 published a *Cyclopedia of Machine and Hand Tools*, containing 155 pages of copper-plate engravings, with descriptive letter-press. He stood at the head of the scientific engineers of England.

RANKING AND SALE is, in Scotch law, an action whereby the land or heritable property of an insolvent person is sold, and the proceeds divided among the creditors. The main object is to sell the property in spite of the debtor, and have the proceeds distributed among the creditors, for which purpose it is necessary to arrange or rank the creditors according to their respective legal priorities. The sale takes place in the parliament house at Edinburgh, one of the macers acting as auctioneer. If no offerers appear, the sale is adjourned, and the upset price is lowered.

RANKNESS, an excessive luxuriance of growth in vegetables, a condition as unfavorable as its extreme opposite to their health and to the productiveness of crops. It is often caused by injudicious manuring, and is most frequent in moist seasons. The decay of mushrooms in pastures, as in fairy rings (q.v.), sometimes produces a rankness of grass which causes all animals to refuse it; such herbage abounding to an unusual degree in chlorophyll (q.v.), but being very deficient in those qualities which render herbage most palatable and nutritious to cattle. Rankness in grain-crops is attended with a diminished production of grain, the flowers often proving abortive, and with a much increased liability to the attacks of parasitic fungi. In fruit-trees, it displays itself, even when the soil is only a little too rich, in a tendency to the production of shoots and foliage, instead of blossoms and fruit, and is to be counteracted by withholding manure, by root-pruning, or by cutting away portions of bark. In wall-trees, deep cuts may even be made into the wood, although in standards this would involve a danger of destruction by the next storm.

RANNOCH, MOOR AND LOCH. The moor, in the n.w. extremity of Perthshire, with a mean elevation of about 1000 ft. above sea-level, is a wild waste, 28 m. long, and 16 m. broad, and is one of the largest and most desolate and dreary moors in Scotland. Its surface is for the most part a broad, silent, and featureless tract of bog, heath, and rock, girdled by distant and gloomy mountains. In its western part is loch Lydoch, which winds amid flat and dismal scenery. Stretching eastward from the moor is loch Rannoch, about 9 m. long by from 1 to 2 m. broad. It is surrounded by mountains, contains two islands, and is drained of its surplus waters by the Tummel, a tributary of the Tay.

RANSOM—corrupted from the Latin *redemptio*—is the price paid by a prisoner-of-war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare, the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors; but those for princes or great nobles, to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming king Richard I. for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and king John of France for £500,000, payable in installments.—In modern warfare, where the fighting is performed by professional soldiers, pecuniary ransoms are scarcely ever resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

RANSOM, a co. in e. Dakota, drained by the Sheyenne river and its branches in the n.e., and several creeks and lakes in the s.; 1764 sq.m.; pop. '80, with La Moure co., 557—357 of American birth. Its surface is generally level, spreading out into broad, fertile prairies. In the n.w. is fort Ransom and a military reservation.

RANTOUL, ROBERT, JR., 1805—52; b. Mass.; graduated at Harvard in 1826, and was admitted to the bar. He represented Gloucester in the legislature 1834—37, where he advocated the abolition of capital punishment. In 1837 he was appointed a member of the state board of education, and the next year removed to Boston. He was collector of that port 1843—45, when he was appointed U. S. district attorney for Massachusetts. In 1851 he filled a part of Daniel Webster's unexpired term in the U. S. senate, and the same year was elected to congress. He was an orator of considerable power, popular with the working classes, and a radical democrat, but an opponent of the fugitive slave law.

RANULA is the term applied to an encysted tumor, containing a glary fluid, and lying under the tongue. The ordinary method of treating such tumors is by free

incision, or by cutting out a piece of the sac; and if this is not sufficient to effect a cure, the interior should be touched with nitrate of silver, or a small seton should be passed through it, with the view of destroying it by suppuration. The name of the tumor is due to the supposed frog-like form which the swelling assumes.

RANUNCULA CEE, a natural order of exogenous plants, mostly herbaceous, rarely shrubs, and generally natives of cold damp climates. Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species is about 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated sheathing stalks. The calyx is of 3 to 6 deciduous hypogynous sepals; the corolla of 3 to 15 hypogynous petals, in one or more rows, sometimes assuming very remarkable forms, as in larkspur, aconite, and columbine; rarely absent, in which case the sepals are gayly colored. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil; the ovary with one or more ovules. The fruit either consists of dry achenia, or is berry-like or follicular.—Acridity is the prevailing character of the order, and the leaves of some species readily produce blisters; but this property disappears when they are dried or heated. Many are narcotic and poisonous; some are used in medicine, as aconite and hellebore. The seeds of *nigella sativa* were formerly used instead of pepper. The fruit of the May apple or wild lemon (*podophyllum peltatum*) of North America may be eaten, but is very acid.—Many of the order produce flowers of great beauty, as some species of *ranunculus* (q. v.), *anemone* (q. v.), *larkspur* (q. v.), *peony* (q. v.), *columbine* (q. v.), *clematis* (q. v.), etc.

RANUNCULUS, a genus of plants of the natural order *ranunculaceæ*; having five sepals; five petals, with a nectariferous pore at the base of each petal, often covered with a scale; many stamens situated on a receptacle, and germens accumulated into a head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers, familiarly known as *buttercups*; others, known by the name of *crowfoot*, are troublesome weeds in gardens and pastures. Many, as the spearworts, are found chiefly in moist places, and some are altogether aquatic, covering the surface of ditches, ponds, and rivers, where the water is shallow, with a carpet of verdure exquisitely studded with beautiful white flowers.—One species, the ASIATIC **RANUNCULUS**, or GARDEN **RANUNCULUS**, exclusively the ranunculus of florists, a native of the Levant, has been cultivated in Europe for almost 300 years. From clusters of small tubers it sends up several bipartite leaves, and an erect branched stem, with terminal flowers, which, in the cultivated varieties, are often double or semi-double, yellow, white, red of various shades, or of mixed colors, very brilliant, and from an inch and a half to two inches and a half in diameter. The cultivated varieties are extremely numerous. The ranunculus is propagated by seed, by offset tubers, or by dividing the clusters of tubers. The roots are often taken up in summer, after the leaves die, and kept in a dry place till the beginning of the ensuing winter or spring. Protection by frames and glasses, shading from strong sunshine, and other such means, are employed in order to increase the beauty of the flowers. The ranunculus loves a free and rich soil. Double-flowered varieties of some other species, with taller stems and smaller white or yellow flowers, are cultivated in flower-gardens, sometimes under the name of *bachelor's buttons*. The acridity of many species of ranunculus is such that the leaves, bruised and applied to the skin, produce blisters; and those of *R. sceleratus*, a pretty common British species, are said to be used by beggars to cause sores, in order to move compassion. *R. thora*, a Swiss species, is of extreme acridity, and hunters were accustomed, in former times, to poison darts and arrows with its juice. Water distilled from the leaves of *R. flammula*, a British species, with rather tall stem and ovato-lanceolate leaves, common by the sides of ditches, etc., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning.—Yet the leaves of *R. ficaria*—sometimes called *pilewort* and *lessercelandine*, a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pastures in which *R. acris*, *R. repens*, etc., are very abundant are injured by them, and they ought to be diligently grabbed out; they are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage is even advantageous, and that they may act as a condiment. Their acridity is lost in drying, and they are not injurious to hay. The small tubers of pilewort, or lessercelandine, are used for the cure of hemorrhoids; but their acridity also disappears when they are boiled, and they are then a pleasant article of food.

RANZ DES VACHES (in German, *Kuhreigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on an instrument called the *alphorn*, consisting of a wooden tube somewhat bent, about three feet long, widened out into a bell, and bound by a pitched cord. The associations of pastoral life recalled by these airs to the Swiss in foreign countries, have been said to produce that unaccountable longing for home, or *nostalgia*, which has been remarked among the Swiss soldiers abroad. The bands of the Swiss regiments in foreign service have, on this account, to be prohibited from playing the Ranz-des-Vaches. The Emmenthal, Entlebuch, the Bernese

Oberland, the Grisons, Appenzell, and other pastoral districts of Switzerland have each their respective Ranz des Vaches. A collection of Ranz des Vaches, along with other Swiss melodies (*Sammlung von Schweizer Kuhreigen und Volksliedern*), was published at Berne, in 1818; and these airs are also to be found in the *Allgemeines Schweizer Liederbuch*, 1851. The Ranz des Vaches of Switzerland are ruder in their character than the mountain melodies of the Tyrol, with which they are sometimes confounded.

RAPALLO, a maritime t. of northern Italy, province of Genoa, and 17 m. e. of the city of that name, with 5,350 inhabitants. It was first called Tigulia. Its only object of interest is the sanctuary of the Madonna, on the monte Allegro, erected in 1557. Rapallo is a thriving commercial town, and has manufactures of wax and of soap, and of laces in thread and in cotton; it has fisheries of coral and tunny.

RAPE is the crime of having carnal knowledge of a woman against her consent and by force. The essence of the offense is that force be used, and it is immaterial what is the age of the woman, and whether she is married or single, chaste or unchaste. The only difference caused by the habitual unchastity of the woman is that in such a case it is less easy to satisfy the jury that the element of consent was wanting. The two elements of rape are the carnal knowledge and the force used. As to the element of resistance on the part of the woman, or force on the part of the man, several niceties often occur in the application of the law, from the great variety of circumstances attending this crime. With regard to an idiot woman, it has been held that it is not necessary to prove resistance on her part, and that the crime may be committed though she made no resistance. If consent be extorted by fear and threats, or where several men join together, and resistance is useless, this is the same as using violence to overpower the woman. Where the woman is stupefied by drink, so that the power of resistance is annihilated, it is the same as knocking her down. In a case, however, where force is used in the first instance, but the woman afterward in some degree consents, the crime of rape will not be committed, though the evidence may establish the crime of assault. Some difficult cases have occurred with reference to married women who have been beguiled by men personating their husbands, and so been, in a certain sense, cheated out of their consent. But it has been repeatedly decided by a majority of the court, both in England and Scotland, that such an offense was not rape.

One of the important circumstances attending the crime of rape is the mode of proof, and in this respect it differs from other crimes. It is held to be all but essential, as a corroboration of the woman's story, that if her cries of resistance were not heard, at all events she should have, immediately after the offense, complained on the first opportunity to her friends or relations. It is not allowed to give in evidence the particulars of such complaint, but merely the fact that she made a complaint against some person. Unless this important particular be proved, her evidence is looked upon with great suspicion, and may be discredited by the jury, unless there were peculiar circumstances to account for the want of such complaint. One of the common defenses to a charge of rape is the unchastity of the woman, the object being to render it unlikely that she did not consent, and hence it is in practice considered a proper question for the prisoner's counsel to put to her, whether she had not had connection with the prisoner before or with other men; but at the same time she is cautioned by the judge that she is not bound to answer such questions unless she likes. If, however, she denies the accusation, witnesses may be called to contradict her on that point.

The crime of rape is felony by the law of England, and is punishable by penal servitude for life, or for not less than three years, or by imprisonment not exceeding two years, with or without hard labor. Of late attempts have been made to add flogging or corporal punishment to the other punishment, but bills having that object have been thrown out of parliament. There are several other crimes in the same category as rape, but punishable under separate enactments. Thus, the crime of having carnal connection with a girl under the age of 10 years is felony, and punishable like rape. Whoever has carnal connections with a girl who is between the age of 10 and 12 years, is guilty of a misdemeanor, and liable to penal servitude for three years, or imprisonment for two years with hard labor. Consent of the girl in these two cases is immaterial. The forcible abduction of women is divided into two offenses. Wherever a woman of any age has property, and is forcibly taken away with intent to marry or carnally know her, the offense is felony, punishable by penal servitude of three to fourteen years, or two years' imprisonment. Again, if a girl, though having no property, is under the age of 21, and is fraudulently allured or taken away out of the possession of her parents or guardians, with intent to marry or carnally know her, this is felony, punishable as in the preceding case. In order to the commission of the latter offense, an improper motive is necessary on the part of the man, but the consent of the girl is of no consequence.

RAPE, or **COLE-SEED** (*Brassica napus*; see BRASSICA), a biennial plant much cultivated both on account of its herbage and its oil-producing seeds. It is a native of Europe, and perhaps of England; but it is hard to say where it is truly indigenous and where naturalized. It is so nearly allied to *brassica rapa* (turnip), *B. campestris* (Swedish turnip, colza, etc.), *B. oleracea* (kale, cabbage, etc.), and *B. præcox* (summer rape), that botanical distinction is difficult, particularly as to some of the cultivated varieties. Dr.

Lindley gives the following synoptical view of the most characteristic differences of these species, in Morton's *Cyclopaedia of Agriculture*:

Leaves bright green	<i>B. rapa.</i>
Leaves glaucous—	
Leaves hispid when young.....	<i>B. campestris.</i>
Leaves never hispid—	
Siliques spreading.....	<i>B. napus.</i>
Siliques erect—	
Calyx erect.....	<i>B. oleracea.</i>
Calyx spreading.....	<i>B. praeox.</i>

The root of rape is slender, or in cultivation sometimes becomes carrot-shaped (see *NAVEW*); but it never becomes turnip-shaped. The stem is taller than that of the turnip, or Swedish turnip, and the foliage more luxuriant. The cultivation of rape is very general in many parts of the continent of Europe, from which it seems to have been introduced into England at least as early as the 16th c.; and in the 17th c., if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the continent it is not unusual to sow rape in order to *green-manuring*, plowing its herbage into the soil, a mode of enriching land much more common in some parts of Europe than it is in Britain. Rape delights in a rich alluvial soil, and is particularly suitable for newly-reclaimed bogs and fens, in which the turnip does not succeed well; but it is also extensively cultivated in the chalk and oolite districts of the south of England. The mode of cultivation does not differ much from that of turnip, and similar manures are used. In rich soils rape sometimes attains a height of three, or even four feet, so that the sheep turned in are hidden beneath the leaves and seem to eat their way into the field. They eat the stalks even more greedily than the leaves. A too exclusive feeding on rape is, however, apt to produce diseases, which a sprinkling of salt, a supply of hay, etc., are found useful in preventing. When rape is cultivated for seed it is sown in autumn. When the seed is ripe rape is cut with the sickle, and after a short time allowed for drying, the seed is thrashed out, when the haulm is often burned, a wasteful practice, as its decay affords more abundant and useful manure, and indeed cattle are fond of it as food. *Rape-cake*, the mass of seeds from which oil has been obtained by crushing, is used for feeding oxen and sheep, but is very inferior to linseed-cake and some other kinds of oil-cake. Ground into dust it is a very valuable manure. *Rape-oil* is extensively used for machinery and for lamps; but the oil and cake so called are not exclusively obtained from this plant, nor are the names *colza-oil* and *rape-oil* used to discriminate the produce of different plants, although in some parts of Europe the name *colza* is given to varieties of *brassica campestris* and *B. oleracea*, which are cultivated in the same way as rape. *B. praeox* is also cultivated in some places, being sown in spring and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names. See *OILS*.—The name *rape* is from the same root as Ger. *reps*, and Lat. *rapa* (a turnip); *colza-seed* and *colza* from the same as *kale*.

RAPHAEL, or RAFFAELLO SANTI, or SANZIO, called by his countrymen *Il Divino*, "the divine," is ranked by almost universal opinion as the greatest of painters. He was b. at Urbino in 1483. and in 1497, on the death of his father, Giovanni Santi, who was his first instructor, he was placed under Pietro Perugino, the most distinguished painter of the period, who was then engaged on important works in the city of Perugia. In 1504 Raphael visited Florence, and improved his style by studying composition and expression in the works of Masaccio, and color and effect in those of Fra Bartolomeo. He seems to have lived in Florence till 1508, when he went to Rome on the invitation of pope Julius II. His celebrated frescoes in the Vatican and numerous important works were then commenced. Julius died in 1513, but his successor, Leo X., continued Raphael's services, and kept his great powers constantly in exercise. The works of Raphael are generally divided into three classes: His first style, when under the influence of Perugino's manner; his second, when he painted in Florence from 1504 to 1508; and his third style, which is distinguishable in the works executed by him after he settled in Rome. Each of these styles has its devoted admirers. Those who incline to art employed in the service of religion prefer the first manner, as embodying purity and religious feeling. His last manner, perfected when the taste for classical learning and art was strongly excited by the discovery of numerous valuable works of the classic period, is held by many connoisseurs as correctly embodying the highest art; while his middle, or Florentine style is admired by some as exemplifying his powers, freed from what they deem the rigid manner of Perugino, and untainted by the conventionalism of classic art. In all these different styles he has left works of great excellence. "The Coronation of the Virgin," in the gallery of the Vatican, and "The Sposalizio," or Marriage of the Virgin, in the Brera gallery at Milan, belong to the first period. The "St. Catharine," in the national gallery, London; "The Entombment," in the Borghese gallery, Rome; "La Belle Jardinière," in the Louvre, to his second period. While the "St. Cecilia," at Bologna; the "Madonna di San Sisto," at Dresden; "The Cartoons,"

at Hampton court; "The Transfiguration," and all the Vatican frescoes, except "Theology; or, the Dispute on the Sacrament," the first he executed on his arrival from Florence, are in his third manner, or that which peculiarly marks the Roman school in its highest development. Raphael died at Rome on April 6th, 1520, the anniversary of his birthday.

RAPH'ALL, MORRIS JACOB, PH.D., 1798-1868; b. at Stockholm, Sweden, of Jewish parentage; educated in the Jewish college of Copenhagen; received in his 13th year the Hebrew academic degree which procured for him the title of rabbi. In 1812 he went to England, where he spent six years studying the English language; then traveled, and studied at the university of Giessen 1821-24. In 1825 he settled in London; gave lectures in 1832 on the Biblical poetry of the Hebrews; in 1834 published the *Hebrew Review*; in 1841 was appointed rabbi preacher of the synagogue at Birmingham. In 1849 he was invited as rabbi preacher to the Anglo-German congregation of the "great synagogue" *B'nai Jeshurun* in New York. His principal published works are the *Post-Biblical History of the Jews*, 2 vols.; translations of *Eighteen Treatises of the Mishna* jointly with D. A. de Sola; and other translations from Hebrew writers.

RAPHANIA, or **ERGOTISM**, is a disease which was much more prevalent some centuries ago than it is at present. It is defined as "a train of morbid symptoms, produced by the slow and cumulative action of a specific poison peculiar to wheat and rye, and which gives rise to convulsions, gangrene of the extremities, and death" (Aitken's *Science and Practice of Medicine*, 1858, p. 332). It has been described under various names. From the 10th to the 14th centuries it was known as *St. Anthony's fire*, a title which has been since associated with erysipelas. It was then described as epidemic gangrene. The name *raphania* was first given to it by Linné, who thought the morbid symptoms were dependent upon the mixture of *raphanus raphanistrum*, or jointed charlock, with the wheat used as food. It was suspected as early as the end of the 16th c. that the disease was due to the development of a fungus on the grain, and this fact is now established beyond doubt, although some writers hold (like Linné) that this morbid state is also produced by the admixture of poisonous plants, especially *lotum temulentum* or darnel being mingled with the grain. Although rye is the ordinary seat of the poisonous fungus, wheat, rice, and other grains are liable to be similarly affected, and to produce similar results. For an account of the fungus see **ERGOT**.

There are two forms of the disease—the spasmodic and the gangrenous. The spasmodic form begins with tingling or itching of the feet and hands and sometimes of the head. Violent contractions of the hands and feet, giving rise to intense pain in the joints, are a common symptom. The head is much affected, the patient complaining of drowsiness, giddiness, and indistinct vision. If coma or epileptic convulsions supervene there is little hope of recovery. The appetite is usually enormous; spots like those of purpura appear on the face, and there are seldom any signs of improvement for some weeks. The gangrenous form begins with extreme lassitude, and is accompanied by some febrile disturbance. The extremities are painful, cold, almost insensible, and not readily moved; and after a varying time gangrene supervenes.

With regard to treatment, the first thing to do is to replace the poisonous flour by easily-digested, nourishing, wholesome food. The pain must be relieved by opiates, the blood purified by the administration of chlorate of potash, and the general tone of the system improved by tonics, such as the preparations of iron, bark, etc. In the spasmodic form warm baths and gentle friction would probably prove serviceable. Whatever be the form of treatment adopted the mortality in the gangrenous form is usually 90 per cent. The spasmodic form is much less destructive to life.

RAPHIDES are crystals found in the interior of the cells of plants. The word is the plural of the Greek *raphis*, a needle, and was originally used to denominate crystals of an acicular form, which are often collected together in bundles. But crystals of various forms are found in the cells of plants, consisting chiefly of phosphate or of oxalate of lime. In many kinds of plants they very much abound, and often in a particular manner in particular parts of plants. They are very minute and are found in such delicate tissues as the petals of the pelargonium.

RAPIDAN. See **RAPPANHANNOCK**.

RAPIDES', a parish in central Louisiana, on the Calcasieu and Red rivers; bounded n.e. by Saline bayou; traversed by the New Orleans and Texas Pacific railroad; 1400 sq. m.; pop. '80, 23,597—23,237 of American birth; 14,071 colored. The surface is level and there are extensive pine forests; cotton, sugar, corn, and pork are the staples. Chief town, Alexandria.

RAP'IER is said to have had distinct meanings at different times, and in ancient fencing to have been a long cutting broadsword; but for the last century at least the rapier has been a light, highly-tempered, edgeless, thrusting weapon, finely pointed and about 3 ft. in length. It was for long the favorite weapon in dueling, and was worn by every gentleman. At present it is worn only on occasions of court ceremonial, and answers no other purpose than to incommode the wearer. In war a rapier could never have been of any service.

RAPIN DE THOYRAS, PAUL, DE, a French historian of England, was descended from a Protestant Savoyard family, which settled in France in the 16th c., and was born at Castres, in Languedoc, Mar. 25, 1661. He studied at the Protestant college of Saumur, and passed as advocate in 1679, but had no liking for the profession; and when the edict of Nantes (1685) forced him to leave France, he sought employment first in England (where he was unsuccessful), and afterward in Holland, where he enlisted in a corps of volunteers at Utrecht, formed by his cousin-german, Daniel de Rapin. With his company he followed the prince of Orange to England in 1688, was made ensign in the following year, and distinguished himself by his bravery at the siege of Carrickfergus, the battle of the Boyne, and the siege of Limerick, where he was shot through the shoulder by a musket-ball. In 1693 he was appointed tutor to the earl of Portland's son, with whom he traveled in Holland, Germany, and Italy, after which he took up his residence at the Hague; but in 1707 withdrew with his family to Wesel, in the duchy of Cleves, where he devoted the remaining 17 years of his life to the composition of his great work. The severity of his labors is believed to have shortened his days. He died May 16, 1725. Rapin's *Histoire d'Angleterre* was published at the Hague in 8 vols. the year before his death. It was undoubtedly, as Voltaire has said, the best work on English history that had until then appeared: full, minute, careful in citing authorities, clear, rapid, and accurate in narration, methodical in the arrangement of its materials, comparatively impartial in spirit, and yet betraying on the part of the author an honorable reverence for law and liberty. Rapin begins with the invasion of Britain by the Romans, and ends with the death of Charles I. The work was continued to the death of William III. by David Durant (Hague, 2 vols., 1734). The best edition of the *Histoire* in its augmented form is by Lefebvre de Saint-Marc (Hague, 16 vols., 1749, *et seq.*). The original was translated into English by the rev. Nicholas Tindal, M.A. (Lond. 15 vols., 1725-31), and subsequently by John Kelly, barrister (in 2 vols. fol.).

RAPP, GEORGE, and FREDERICK. See HARMONISTS.

RAPP, JEAN, Count, a French gen., was b. at Colmar, in the department of Haut-Rhin, France, April 27, 1773. He was intended for the church, but his taste for a military life led him to enroll himself (1788) in the mounted "chasseurs" of the French army. Rapp distinguished himself by dashing gallantry in Germany and Egypt, and on the death of Desaix at Marengo he became aide-de-camp to Napoleon. His brilliant charge at Austerlitz upon the Russian imperial guard, which put the latter to a complete rout, was rewarded with the grade of gen. of division (Dec. 24, 1805). But Rapp joined to the utmost bravery and coolness a quick and unerring judgment, which enabled him not only fully to comprehend Napoleon's plans, and execute to the spirit the duties intrusted to him, but also at times to amend and even disobey his orders with the happiest results. The latter was the case at Lobau, where Rapp's disobedience decided the battle in favor of Napoleon; and for this service he was named a count of the empire (Aug. 1, 1809). He opposed the Russian expedition with the utmost earnestness; but, notwithstanding, accompanied the emperor throughout the whole of it, adding on many occasions to his own reputation and the glory of the French arms. His obstinate defense of Dantzic for nearly a year against a powerful Russian army placed him in a high position among military men; and his chivalrous and considerate treatment of the unfortunate inhabitants during the siege was so warmly appreciated by them that they presented him with a magnificent sword enriched with diamonds. The Russians, contrary to the articles of capitulation, sent Rapp and his garrison prisoners to Russia, and he did not return to France till July, 1814. On reaching Paris he was well received by Louis XVIII.; and in March, 1815, was one of those appointed to oppose the return of Napoleon; but deserted, along with his troops, to his old master, and was appointed commander-in-chief of the army of the Rhine (April 16), and peer of France (June 2). After Waterloo, Rapp again submitted to Louis, but retired to Switzerland for two years, returning in 1817, and receiving a full pardon in the following year. He was re-created a peer of France (March 5, 1819), and held various offices about the court; but, broken in health by constant hard service and numerous severe wounds, he died at Paris, Nov. 8, 1821. A volume of memoirs (1823, in 8vo) has been published under his name.

RAPPAHAN NOCK, a river of Virginia, formed by the union of the North Fork and the Rapidan, which rise in the Blue ridge of the Alleghany mountains, and flow eastwardly to their point of union, 40 m. above Fredericksburg, where the falls afford water-power. The river is navigable from this point s.e. to Chesapeake bay, which it enters by a broad estuary, 70 m. long. The Rappahannock and the Rapidan were the scenes of some of the most sanguinary battles of the war of secession, at Fredericksburg, Chancellorsville, and the Wilderness.

RAPPAHANNOCK, a co. in n. Virginia, lying on the w. slope of the Blue ridge range; drained by the Hazel and Rappahannock rivers; 230 sq. m.; pop. '80, 9,297—9,276 of American birth; 3,536 colored. The surface is very hilly, there is much beautiful scenery, and the valleys are of great fertility; wheat, corn, grass, and pork are the staples. Co. seat, Washington.

RAP PAREE, a wild Irish plunderer, so called from his being generally armed with a rapary, or half-pike. The term was in common use in the 17th century. See *Notes and Queries*, Aug. 17, 1861.

RAPPEE', a coarse-grained species of snuff (q.v.). The word is of French derivation, and arose from this species of snuff being manufactured from dried tobacco by means of the *rape* or *raspe*, an instrument by which the thin parts of the leaf were cut from the veins and fibers, the latter alone being used in the manufacture of rappee.

RAPPEN, a small Swiss coin, made of an alloy of copper and tin, forming the $\frac{1}{100}$ th part of the modern franc (q.v.), and therefore equivalent to the French centime. The old Swiss franc (= about 1s. 2d. sterling) was also divided into 100 rappen. The rappen was first coined at Freiburg, and took its name from the head of a raven (Ger. *rabe*, pronounced in some parts *rape*) impressed upon it.

RAPTO RÉS. See ACCIPITRES.

RARATONGA. See COOK ISLANDS.

RARITAN, a river in n. New Jersey, 33 m. long, formed of two branches, the n. branch rising in the highlands of Morris co., and the s. branch finding its source in Morris co., flows through Hunterdon co., uniting with the n. branch to form the Raritan in central Somerset co., thence intersecting Middlesex co., empties into Raritan bay at Perth Amboy. In its course it passes the cities of Somerville and New Brunswick, and is navigable to the latter city, 15 m. above its mouth.

RAS = (Heb. *rosh*), an Arabic word, signifying "head," "promontory," occurs in the names of many capes on the Arabian and n. African coasts, and also in Sicily and Malta; as Rasigelbi (corrupted from Rasi-calbo), "the dog's cape," on the n. coast of Sicily; Ras-el-Abyad, "white cape," on the coast of Palestine; Ras Bab-el-Mandeb, "cape of the gate of tears," at the strait of Bab-el-Mandeb; Ras-el-Jezirah, "cape of the peninsula;" Ras-el-Had, the eastern point of Arabia.

RASHES, affections of the skin, characterized by a red superficial efflorescence, diffused or in patches, disappearing under pressure, and usually ending in desquamation. To this division of cutaneous disorders belong rubeola (or measles), scarlatina (or scarlet fever), crysipelas (or St. Anthony's fire), erythema, roseola (or scarlet-rash), and urticaria (or nettle-rash). Of these rashes, rubeola, scarlatina, and crysipelas are rather to be regarded as fevers or blood diseases than as cutaneous diseases, in the true sense of the phrase.

RASHI (i.e., Rabbi Solomon [Shelomo] Izaaki, or Ben Izaak, often erroneously called Jarchi), the greatest Jewish commentator and exegete, was born about 1040, in Troyes, in France. The range of his studies was as extraordinarily wide as were his early developed faculties brilliant, and his industry and perseverance enormous. Philology, philosophy, medicine, astronomy, civil and canonical law, exegesis, were the chief branches of his learning; and to a rare proficiency in them, he united a complete mastery over the whole range of Scripture and the Talmudical sources. In order further to perfect himself for his gigantic task, he traveled for seven years, visiting the academies of Italy, Greece, Germany, Palestine, Egypt, where he sat at the feet of the great masters of the age, collecting their sayings and legal decisions. His chief work—and one universally recognized as the principal work of all scriptural exegesis—is his commentary to the whole of the Old Testament. Up to this day it has not been superseded by any other, although in the province of philology and antiquities, investigation has been much furthered since his time. Rashi's style is extremely brief and concise, yet clear and pregnant; obscure and abstruse (as it has been pronounced by some) only to those who lack the necessary preliminary knowledge. According to the fashion of its day, it is replete with allegorical or rather poetical illustrations, gathered from the wide fields of the Midrash within and without the Talmud; and many a passage is thus preserved to us, which, in the disordered state of those manuscripts, would probably otherwise have been lost. This commentary—entirely translated into Latin by Breithaupt, and partly also into German—was the first book ever printed in Hebrew (Reggio, 1474), and has since been reprinted with almost every complete edition of the Hebrew Bible. Of his numerous other works is first to be mentioned his commentary to 23 treatises of the Talmud, supplemented after his death by his grandson, Samuel ben Meier; further, a commentary to the Pirke Aboth; the *pardes*, treating of laws and ceremonies; a collection of legal votes and decisions; a commentary to Midrash Rabbah; a book of medicine; a poem on the unity of God, etc., etc. He died about 1105; and such was his piety and his surpassing eminence, that later generations wove a shining garland of legends around his head. The confusion of Rashi with two Jarchis, who lived long after him, has not hitherto been properly accounted for. They bore that surname because they were born at Lunel, Jerach being the Hebrew for moon, *lune* in French.

RASK, RASMUS CHRISTIAN, a distinguished Danish philologist, was b. at Brendekilde, near Odense, in the island of Fünen, Nov. 22. 1787; studied at Copenhagen, and in 1808 published his first work, *Vejledning til det Islandske eller gamle nordiske Sprog* (Rules of the Icelandic Language, or the Ancient Language of the North). During the years 1807-12 he occupied himself with drawing up grammatical systems for most of the Germanic, Slavic, and Romanic tongues, and in comparing them with those of India. He then visited Sweden, where he commenced to study Finnish; and in 1813 proceeded to

Iceland, where he lived for two or three years, perfecting his knowledge of the language, the history, and the sagas of the inhabitants. On his return to Copenhagen he was appointed sub-librarian to the university; and in 1818 published a splendid work, *Undersøgelse om det gamle nordiske eller Islandske Sprogs Oprindelse* (Researches concerning the Origin of the Icelandic or Ancient Language of the North), which led Grimm to his famous discovery of the displacement of consonants in the Teutonic languages. Previous to this, however, he had resolved to visit Asia; and after spending a year (1817) in Stockholm, where he published his admirable *Angelsaksisk Sproglaere* (Anglo-Saxon Grammar), and the first critical and complete edition of the two great monuments of Scandinavian mythology, the *Snorra Edda* and the *Edda Saemundar*, he went to St. Petersburg, where he devoted himself for two years, with intense eagerness, to the study of the oriental languages, principally Sanskrit, Persian, and Arabic, but not failing to acquire, at the same time, a competent knowledge of Russian and Finnish. Thus equipped he proceeded to Astrakhan, where he stayed six weeks, to study the language of the Tartars, and then commenced a journey through the country of the Turkomans, the Caucasus, Persia (where he added the Mongol and Mantchu dialects to his already enormous linguistic acquisitions), Hindustan (cultivating in the last-mentioned country the society of learned Brahmans, and visiting all their great schools), and finally Ceylon, where he made himself acquainted with Cingalese and Pali, and wrote his *Singalesisk Skriflæere* (Colombo, 1822). In 1823 Rask returned to Copenhagen, laden with learning and rare manuscript treasures, of which the greatest part was presented to the university. In 1825 he was appointed professor of "literary history," and in 1828 of oriental languages. Next year he was made chief custodian of the university library; and in 1831, professor of Icelandic. But his immense labors had exhausted his energies, and he died Nov. 14, 1832, at the early age of 45, a victim of hard work. Besides the productions already mentioned, Rask wrote *Frisisk Sproglaere* (Cop. 1825); *Den gamle Aegyptiske Tidsregning* (The Ancient Egyptian Chronology, 1827); *Den ældste Hebraiske Tidsregning* (The Oldest Hebrew Chronology, 1828); besides grammars of several languages, and a great number of miscellaneous articles in the learned journals of the north, which were collected after his death, and published (Cop. 3 vols., 1834-38), together with a life by Petersen.

RASKOL'NIK (Russ. *separatist*), the name of a variety of sects in the Russian church, which date from an early period, and must be regarded rather as a general designation of dissenters from the established church of Russia, than as a description of any specific form of doctrinal belief. Such dissent is traceable from the very earliest period of the distinct organization of the Russian church. A monk, named Andrew, in 1003; another, called Demity (Demetrius), in the 12th c.; an Armenian monk, named Martin, who was burned as a heretic at Constantinople in the end of the same century; Leo, bishop of Rostow, in the beginning of the 14th, and Strigolnik and Nikita toward its close—are all mentioned as having originated or propagated heresies of various kinds. A still more remarkable and more formidable organization—a form of Crypto-Judaism—was introduced in the 15th c. by a concealed Jew, called Zacharias, who succeeded in gaining many followers. One of these, called Zosima, is particularly noticeable as having obtained much popularity, and even managed to have himself elected metropolitan of Moscow. His sect, which studiously concealed itself wherever this concealment seemed necessary, was condemned by a synod (1490), and repressed with great rigor; but it continued to maintain a concealed and precarious footing, and is said to possess disciples even to this day, especially in the government of Irkutsk, under the name of Selesnewschtschina. A sect, whose leading principles were borrowed from the German reformers, was founded in 1553 by Matthias Baschkin; but it was condemned at a synod in Moscow, and does not appear to have taken much hold on the people.

But it is from the middle of the 17th c. that—the separation of the sects from the national church having become more tangible, from its involving non-conformity with the established worship—the designation of Raskolnik finds its fullest application. At that period a complete revision of the ancient Slavonic liturgical and ritual books, which had suffered grievously from the ignorance, and probably also from the heterodoxy of transcribers, was undertaken by the patriarch Nikon. See PHILIPPINS. The revised books were introduced into the churches by the authority of the czar as well as of the patriarch; but many of the clergy and people resisted the innovation, and refused the new liturgies. Foremost among the recusants, or non-conformists, were those who had already been sectaries upon other grounds; but all differences were to some extent merged in this common ground of protest, and all were known under the common appellative Raskolniks.

In later Russian history the Raskolniks are sometimes called by the name, which they themselves affect, of Starowierzi ("men of the old faith"), or Prawaslawnūje ("orthodox"). Each sect has its specific doctrinal peculiarities; but most of them follow certain common observances, in which lies their tangible difference from the national church. They cross themselves with the first and middle finger, and not with the first three fingers; they use only the unrevised service-books; they repeat Hallelujah only twice; in church ceremonies they turn from left to right, and not from right to left; they use seven and not five altar-breads in the eucharistic offering; they pay worship only to ancient pictures, or those painted by themselves; they use an eight-pointed instead of

the ordinary cross; they attend only their own churches, and hold no communion of worship with the members of the national church; they never shave or cut their hair, and adhere strictly to the old Russian costume.

They may be divided, in general, into two classes—those which have popes (priests), and those who do not recognize the priestly order. The former are in every respect more moderate and more free from fanaticism than the Raskolniks, who discard the ministry of priests. Their priests, however, have often been outcasts of the orthodox church, who betook themselves to the rival communion. The most notable among the Raskolniks of this class are those called Peremasanowschtsina, who re-ordain all popes joining their communion; the Jewlewschtschina, who are said to permit freedom of divorce and exchange of wives; Dositheowschtschina, so-called from their founder, a monk named Dositheus; and Tschernobolzi, whose chief distinction consists in refusing to take an oath, and to say the prayer for the emperor prescribed in the liturgy. Of the popeless Raskolniks, the chief are the Philippins (q.v.), the Pomoranians or Rebaptizers, the Theodosians—an offshoot of the Pomoranians—and a sect of mystic spiritualists with strong Protestant and rationalistic leanings, called Duchoborzen. A curious development of the Raskolniks movement is found in the Samokrischtchina (self-baptizers) and the Samostrigolschtschina (self-ordainers), among whom each one administers baptism to himself, each priest ordains himself, and each monk or nun performs the ceremony of their own consecration without the interposition of the regular ministry. It may be added, in conclusion, that with a considerable proportion of these various sectaries, there is found largely mixed up with religious fanaticism an element of communism and of disaffection toward the reigning dynasty, or, more properly, toward the established order of things. The latter may be in part explained by the rigorous measures of repression under which the Raskolniks have suffered for many successive generations. The former is an ordinary accompaniment of the sectarianism of the poor, and is especially frequent among sectaries of the peasant class.

RASPAIL, FRANÇOIS VINCENT, 1794-1878; b. France; fought at the barricades in the revolution of 1830. He opposed the government of Louis Philippe, and was prosecuted for his newspaper articles, and for his membership of illegal societies. In 1831 he published *Cours Élémentaire d'Agriculture et d'Économie Rurale*; and in 1837 *Système de Chimie Organique*. In 1852 he was imprisoned for his opposition to the *coup d'état*. On his release he went to Belgium. He was a member of the *corps législatif* in 1869, and of the chamber of deputies 1876-77.

RASPBERRY, *Rubus idæus*, the most valued of all the species of *rubus* (q.v.). It has pinnate leaves, with 5 or 3 leaflets, which are white and very downy beneath, stems nearly erect, downy, and covered with very numerous small weak prickles; drooping flowers, and erect whitish petals as long as the calyx. The wild raspberry has scarlet fruit, and is found in thickets and woods throughout the whole of Europe and the n. of Asia. It is common in Britain. The raspberry has long been in cultivation for its fruit. There are many cultivated varieties, with red, yellow, and white fruit, much exceeding the wild kind in size. The stem in a wild state is 3 to 4 ft. high; in cultivation, 6 to 8 ft. or upward. Some of the cultivated varieties are also more branching than is common in a wild state, the stem of the wild plant being simple or nearly so. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. Plantations of raspberries are most easily made by means of suckers. The raspberry loves a light rich soil, and is rather partial to a shady situation. The tall kinds are unsuitable in situations much exposed to winds, as the stems are easily broken. The rows are generally about 4 ft. apart, the plants 3 to 4 ft. apart in the rows. The young stems are thinned out to allow free access of air to those which are left. Stakes are often used to support the stems, or they are variously tied together. The fruit is used for dessert; for jams, jellies, etc.; for making or flavoring many kinds of sweetmeats; and mixed with brandy, wine, or vinegar, for the preparation of *R. syrup*, *R. vinegar*, etc. Different preparations of it are used in medicine in cases of fever, inflammation, etc. Raspberry vinegar is a particularly grateful and cooling drink in fevers. Raspberries, fermented either alone or along with currants or cherries, yield a strong and very agreeable wine, from which a very powerful spirit can be made.—Some of the other species of *rubus*, most nearly resembling the raspberry, produce also agreeable fruits. *R. odoratus* is a highly ornamental shrub, a native of Canada and the northern states of America, is frequent in gardens both in Europe and America, but rarely produces its fruit in Britain.

RASPBERRY VINEGAR, a culinary preparation, consisting of raspberry juice, vinegar, and sugar. It is best made by putting carefully gathered and very ripe raspberries into jars, and when as full as they will hold of the fruit, fill up the jar with good vinegar; after 8 or 10 days, pour off the vinegar, and let the fruit drain for some hours. The mixture of vinegar and juice thus obtained is added to another quantity of fruit, and treated in the same way. This is sometimes repeated a third time, and then the liquid is gently boiled for about five minutes with its own weight of refined sugar. Added to water it forms a most refreshing summer drink, and is a useful cooling drink in sickness.

RASSEL, LOUIS NATHANIEL, 1844-71; b. France; reared a Protestant; graduate of the polytechnic school in 1862, and of the military school of Metz in 1866; soon achieved reputation as a writer on military matters. After the capitulation of Bazaine at Metz he escaped, and denounced that chief; and when Paris capitulated and terms of peace were made by the Thiers government, Rassel joined the government of Paris, which rejected peace on those terms, and fought in its service against the national forces. Taken prisoner by the latter he was tried by a court-martial for treason, and sentenced to be shot. The high esteem that his talents and character had won him were testified in petitions for clemency from his former associates who had not acted with him, but which were unsuccessful, and he was shot Nov. 28, 1871.

RASTADT, a t. and fortress in Baden, stands on the river Murg, 3 m. from its junction with the Rhine, and 15 m. s.w. of Karlsruhe. It is a station on the Baden railway. Steel wares, weapons, and tobacco are manufactured. From 1725 to 1771 the town was the residence of the margraves of Baden-Baden. From 1840 till 1866 the fortress of Rastadt was occupied by the troops of the Germanic confederation. Rastadt is memorable for two congresses—the former in 1714, when a treaty of peace, which brought the war of the Spanish succession to a close, was signed between marshal Villars and prince Eugene; and the latter in 1799. On the breaking up of the congress of 1799 without any definite result, the three French plenipotentiaries set out for Strasbourg on the evening of April 19; but they had scarcely got beyond the gates of Rastadt when they were attacked by a number of Austrian hussars; two of the three were slain, and the third sabered, and left for dead in a ditch. The papers of the legation were carried off, but no further spoil was taken. This flagrant violation of the law of nations roused the indignation and horror not only of France, but of all Europe. The instigator and conductor of the assault were never known. Pop. '75, 12,205. Rastadt is now officially spelled *Rastatt*.

RAT, the popular name of all the larger species of the genus *mus*. See MOUSE. Two species are particularly deserving of notice, the only species found in Britain, or, indeed, in any part of Europe, and both very widely distributed over the world: the BLACK RAT (*M. rattus*) and the BROWN RAT (*M. decumanus*). Extremely abundant as these animals now are, their introduction into Europe—which, if at all through human agency, was unintentionally so—took place within recent times. Neither of them was known to the ancients. Both appear to be natives of the central parts of Asia, where other nearly allied species are also found. The black rat found its way to Europe about the beginning of the 16th c.; the brown rat first appeared at Astrakhan in the beginning of the 18th c., and reached Britain and the western countries of Europe about the middle of the century. The Jacobites of Britain were accustomed to delight themselves with the notion that it came with the house of Hanover, and chose to call it the *Hanoverian rat*. It also received the name of *Norway rat*, from a belief, unquestionably erroneous, that it was introduced from Norway, a country which it did not reach until long after it was fully established in Britain.

These two species are like one another, and very similar in their habits. The brown rat is the larger and more powerful of the two, and has waged war against the other with such success as to cause its total, or almost total, disappearance from many places where it was once very abundant; so that in many parts of Britain, where the black rat was once plentiful and troublesome, it would now be difficult, perhaps impossible, to obtain a single specimen. Rats, when pressed by hunger, do not scruple to devour the weaker even of their own kind. The extirpation of the black rat does not, however, always follow from the introduction of the brown rat, each probably finding situations more particularly suited to itself. In their native regions, they exist altogether; and in some parts of Europe the black rat is still the more plentiful of the two. Both infest ships, and are thus conveyed to the most distant parts of the world, some of them getting ashore at every port, and establishing new colonies, so that they are now common—and particularly the brown rat—almost wherever commerce extends.

The black rat is nearly $7\frac{1}{2}$ in. in length, exclusive of the tail, which is almost 8 in. long. The brown rat attains a length of more than $10\frac{1}{2}$ in., with a tail little more than 8 in. long. Besides its larger size and comparative shortness of tail, it differs from the black rat in its smaller ears and less acute muzzle, as well as in its lighter color and shorter hair. The tails of both are covered with a multitude of rings of small scales.

Both species are extremely prolific, breeding at a very early age, several times in a year, and producing from 10 to 14 at a birth. The excessive increase of their numbers, where abundant food is to be found, and there are few enemies to interfere with them, is thus easily accounted for. They sometimes multiply amazingly in ships; and perhaps nowhere more than in the sewers of towns. But in the latter situation, they really render good service to the promotion of public health, acting as scavengers, and devouring animal and vegetable substances, the putrefaction of which would otherwise be productive of pestilence. Such, indeed, seems to be the great use of the rat in the economy of nature; and it is perhaps worthy of notice, that the visits of the plague to western Europe and to Britain have ceased from the very time when rats became plentiful. The brown rat, inhabiting sewers, is generally larger, fiercer, and of coarser appearance than the same species in houses or barns. Rats are also often found inhabiting burrows in dry

banks, near rivers, etc. They feed indiscriminately on almost any kind of animal or vegetable food; they make depredations in fields of grain and pulse, from which they often carry off large quantities to be stored in their holes; they devour eggs; they kill poultry, partridges, etc.; they make most unwelcome visits to dairies and store-closets; and they multiply enormously in the vicinity of slaughter-houses and knackers' yards, which afford them great supplies of food. Their strong rodent teeth enable them to gnaw very hard substances, such as wood and ivory, either for food, or in order to make their way to more tempting viands.

They are creatures of no little intelligence. Many curious stories are told of the arts which they employ to attain desired objects, of the readiness with which they detect the approach of danger, and the skill with which they avoid it. Their sense of smell is very acute, and the professional rat-catcher is very careful that the smell of his hands shall not be perceived on the trap. They are very capable of being tamed, and have in some instances proved interesting pets.

The flesh of rats is eaten, but only by rude tribes, or when food is scarce. The skin is used for making a fine kind of glove-leather.

The name rat is often popularly given, not only to species nearly allied to these, but to other species of *murida*, now ranked in different genera, some of which are noticed in other articles.

RAT, WATER. See **VOLE.**

RATAFIA, the generic name of a series of cordials, prepared usually by mixing an alcoholic liquor with the juice of some fruit or some flavoring material, and sugar or syrup. The name is of French origin, and is said to have been given in consequence of the former habit of preparing a choice drink to be used at the ceremony of *ratifying* a treaty. A favorite flavoring for ratafias is the almond—hence, bitter almonds, cherry, peach, apricot, plum, and other similar kernels, are much used, and hence small almond-flavored cakes are called ratafia cakes; but many other flavors are used, as orange flowers, gooseberries, raspberries, aniseed, angelica stalks; chocolate; black currants, coffee, etc.

RATCH, OR RATCHET, in machinery, is a small piece of metal, so placed with one end on a pivot that the other can fall into the teeth of a wheel. Being perfectly free to move up and down, its own weight makes it drop into tooth after tooth as the wheel revolves. But, from the peculiar shape of the teeth, which have the form of an inclined plane on one side, and a perpendicular face on the other, the wheel can only revolve in one direction.

RATE, OR ASSESSMENT, is a money payment levied upon the owners or occupiers of real property, in respect of some benefit to such property, or in discharge of some legal liability attaching to it. The power of rating proprietors or tenants of lands is a power not existing by the common law of England, except for the repair of the parish church or of the parish highways; for poor rates, county rates, etc., are all authorized by some statute or statutes. A rate is in the nature of a local tax, and therefore so far contrary to the law, that clear authority must always be shown for levying it. Hence, whenever a statute prescribes the conditions under which a rate may be imposed, it invariably states by whom the rate is to be made, and how it is to be enforced, and what appeal is to be allowed in case of an individual being aggrieved. These conditions must all be strictly complied with to the letter, otherwise the party rated can raise objections, and resist the rate. It may be said to be a general rule, that all rates must be so entitled that the parties rated are informed even by its heading whence the authority is derived. It is almost an invariable rule that the payment of rates is enforced in a summary way by justices of the peace, and this is one of the chief functions performed by justices. The mode in which this is practically done is by the party who has power to rate, or the agent or collector, applying to the justices for a summons, calling on the rate-payer to pay it. If payment is refused or neglected, application is next made for a distress-warrant to enforce payment, which means, if the payment is not made forthwith, or within a short specified time, the constable may seize the goods and chattels of the rate payer, and sell them to make up the amount; and if there are no goods to seize, the party may be imprisoned for a specified time. As a general rule, imprisonment is only allowed after all means of recovering the rate by distress or seizure of the goods have failed. Owing to the strictness with which the machinery of rating must be carried on as directed by the statute, the ingenuity of the rate-payers, whetted by the natural indisposition of mankind to pay taxes, constantly prompts them to detect flaws in the proceedings, and litigation in various shapes is thereby produced throughout the country. As a new rate is almost invariably made every year, and sometimes every half year, constant opportunities for displaying this spirit of resistance are afforded.

RATEL, *Mellivora*, a genus of quadrupeds of the bear family, *ursida*, nearly allied to the gluttons (q. v.), from which it differs in having one false molar less in each jaw, and the upper tubercular teeth slightly developed. The general aspect is similar to that of the badgers, but heavier and more clumsy. Two species are known, one of which, the **CAPE RATEL** (*M. ratel* or *Capensis*), inhabits the s. of Africa, and is said to feed much on bees and their honey, its thick fur protecting it against their stings; the other inhabits the n. of India, prowls about by night, is a voracious devourer of animal food,

and often scratches up recently interred bodies from their graves. The Cape ratel is about the size of a badger; gray above, black below. It is easily tamed, and is amusingly active in confinement, continually running about its cage, and tumbling strange somersaults to attract the attention of spectators, from which it seems to derive great pleasure.

RATEL-I-COUM, a Turkish sweetmeat, which has become common in confectioners' shops under several names, but chiefly that of "lumps of delight." Its composition is starch and syrup, sometimes colored. It is imported in the form of small cakes, about an inch thick, and 1 or 2 in. square, and evidently cut from a mass. These pieces have been sprinkled with powdered white sugar, to prevent them from sticking together in the small boxes in which they are packed.

RA'THENAU, or **RATHENOW**, a t. of Prussia, in the province of Brandenburg, on the right bank of the Havel (here crossed by a stone bridge), 45 m. w.n.w. of Berlin. It consists of two portions, one old, and surrounded by walls, and the other new. Weaving, spinning, and brick and tile making are carried on, and there are three factories for making optical instruments. Pop. '72, 8,500.

RATHKEALE, a market and post t. of the co. of Limerick, Ireland, situated on the river Deel, 17 m. s.w. of Limerick. Rathkeale is a place of some inland commerce, but possesses no manufactures of any note. It is remarkable as a chief center of the palatine settlers introduced into Ireland soon after the close of the Jacobite war. Several of the families still remain in the district. The pop. in 1861 numbered 2,761, and in '71 had decreased to 2,517.

RATHLIN, ISLAND OF, an island $6\frac{1}{2}$ m. in length by $1\frac{1}{2}$ in breadth, in the barony of Carey, co. of Antrim, Ireland, $6\frac{1}{2}$ m. distant from the coast of Ballycastle, lat. $54^{\circ} 36'$ n., long. $9^{\circ} 15'$ w., supposed to be the Ricinia of Ptolemy, and Ricinia of Phny, and called variously by later writers Rachi, Raghlin, and Ragheren, or Ragh Erin, fortress of Ireland. Rathlin has been known in history since the days of the first religious migrations of the Irish monks under Columba; it was the scene of more than one struggle in the Danish wars, and it afforded shelter, after his defeat in Scotland, to Robert Bruce. In 1558 the Scottish colony which then inhabited the island was attacked by the lord-deputy Sussex, and expelled from the island with such slaughter, that in 1590 Rathlin was said to be entirely uninhabited. The geological formation of Rathlin is basalt with limestone, and on the e. side the basalt takes a columnar form, similar to that of the Giants' Causeway on the Irish and of Staffa on the Scottish shore. The soil is light, but in the sheltered valleys productive. Formerly, a considerable industry existed on the island in the manufacture of kelp; but since the cessation of that trade (see **KELP**) the pop., which in 1841 amounted to 1039, had, after a lapse of 30 years, been reduced to less than half that number.

RATIBOR, a t. of Prussia, in upper Silesia, stands on the left bank of the Oder, 44 m. s.s.e. of Oppeln. It is a growing town, and a station on the Breslau and Vienna railway. Pop. '75, 17,269, who are employed in the grain and timber trade and in the manufacture of tobacco.

RATIFICATION is a legal term used in the law of Scotland to denote the acknowledgment made by a married woman apart from her husband, and before a justice of the peace, that a deed executed by her is voluntary, and made with full knowledge of its legal effect. In this sense, the term corresponds to what is technically called in England an acknowledgment by a married woman. With regard to minors, the term is also technically used to denote the kind of confirmation or approval given by a person arrived at majority to acts done by him during minority, and which has the effect of conclusively establishing the validity of the act, which would otherwise be voidable.

RATING OF MEN, in the navy, signifies the grade in which the man is entered on the ship's books; as, rated a petty officer, rated an able seaman, etc.

RATINGS OF SHIPS are classifications by which certain allowances, the complement of officers, and other arrangements are regulated. This rating is for merely official and administrative purposes, and gives no idea of the force of the ships. The classification at present is as follows: 1. *Rated ships*. *First-rates*—all ships carrying 110 guns and upward, or 1000 men and upward. *Second-rates*—one of the queen's yachts; all ships above 80 guns and under 110, or with crews of from 800 to 999 men. *Third-rates*—the queen's other yachts; vessels bearing the flag or pendant of any admiral-superintendent or captain-superintendent of the royal dockyards; all ships of 60 to 80 guns, or carrying 600 to 799 men. *Fourth-rates*—all frigate-built ships carrying from 410 to 600 men. *Fifth-rates*—all ships of from 300 to 400 men. *Sixth-rates*—all other ships bearing captains. 2. *Sloops*—comprising all vessels bearing commanders, and having the principal armament on one deck in broadside ports. 3. *Gun-vessels*—all vessels having commanders, and carrying their principal armament on one deck amidships. 4. *All other ships* and smaller vessels commanded by lieutenants.

RA TIO See PROPORTION.

RATION, in the army and navy, is the allowance of provisions granted to each officer, non-commissioned officer, soldier, or sailor. The army ration at home is $\frac{3}{4}$ lb. of meat, and 1 lb. of bread ("best seconds") if in barracks, or $\frac{3}{4}$ lb. of meat with $1\frac{1}{2}$ lbs. of bread if in camp. If a grocery ration is also issued, $1\frac{1}{2}$ d. for each such ration is deducted from the pay of the recipient. When men are not supplied with rations, an allowance of 6d. per diem is granted. Abroad, the ration is 1 lb. of bread, or $\frac{3}{4}$ lb. of biscuit, and 1 lb. of fresh or salt meat, except at certain stations, where, for climatic reasons, a different ration is specially provided. The bread ration may be increased during operations in the field, though not above $1\frac{1}{2}$ lbs. of bread or 1 lb. of biscuit. During active operations, the officer commanding may direct the issue, in addition to the above, of wine, spirits, or any other article of subsistence equivalent thereto. The stoppage for this foreign ration is 1d. The families of soldiers accompanying them abroad are allowed the following rations: the wife (married under regulation), half a ration; each legitimate child under 7, a quarter ration; from 7 to 14, a third part of a ration. When officers receive a colonial allowance in lieu of rations in kind, each is subjected to a daily stoppage of 2 $\frac{1}{2}$ d. A ration of forage at home consists of 10 lbs. of oats, 12 lbs. of hay, and 8 lbs. of straw for each horse. Cavalry soldiers receive this without stoppage; but their officers suffer a deduction of 8 $\frac{1}{2}$ d per ration. Staff officers and mounted officers of infantry provide their own forage, and are granted a pecuniary allowance of 1s. 10d. per day to enable them to do so.

The full navy ration consists of the following articles: Daily— $1\frac{1}{4}$ lbs. of ship-biscuit, or $1\frac{1}{4}$ lb. of soft bread, $\frac{1}{2}$ pint of spirit, 2 oz. sugar, 1 oz. chocolate, $\frac{1}{2}$ oz. tea; 1 lb. fresh meat, and $\frac{1}{2}$ lb. fresh vegetables, when these are procurable; otherwise 1 lb. salt pork, with $\frac{1}{2}$ pint split peas, or 1 lb. of salt beef, with 9 oz. flour, $\frac{3}{4}$ oz. suet, and $1\frac{1}{2}$ oz. of currants or raisins. On alternate salt-beef days—2 oz. preserved potatoes. Weekly— $\frac{1}{2}$ pint oatmeal, $\frac{1}{2}$ oz. mustard, $\frac{1}{2}$ oz. pepper, $\frac{1}{2}$ pint vinegar.

The sailor's ration is issued free of any stoppage.

RATIONALISM (Lat. *ratio*, reason), strictly signifies that method of thought which in matters of religion not only allows the use of reason, but considers it indispensable. The term has now, however, acquired a wider meaning, and stands in opposition to *supernaturalism*, or the belief in that which either transcends, or, as others view it, contradicts, both nature and reason—as, for example, miracles. To comprehend rightly the struggle between rationalism and supernaturalism, in modern Protestant theology, one must look at it from a historical point of view. The German and Swiss divines, in maintaining their polemic against Roman Catholicism (after the original enthusiasm of the reformation had cooled down), took their stand on the absolute authority of the Bible as a purely divine book, containing no admixture of error of any kind, either in form or substance—the very vowel-points of the Hebrew (an innovation long posterior even to Christianity) being expressly held to be inspired. This, the oldest and most stringent kind of Protestant orthodoxy, gradually fell to pieces, partly on account of its unscientific character, and partly because it was demonstrated that the Bible itself put forth no pretensions to such infallibility. The first concessions to rationalism were the admissions that the biblical writers differed in regard to their style and literary merit; next (as a logical inference from the foregoing), that they exercised a certain amount of independent power in the composition of their works. But gradually other points were assailed, some of which have been surrendered, while others are still tenaciously held; as that, in matters of physical science, the sacred writers spoke according to the conceptions and beliefs prevalent in their age, and not according to any supernatural enlightenment; that, on historical points, their information might be either erroneous or defective, or both; that they might err in anything except religious doctrine or sentiment; finally, that they might err in such, too, and that the Bible is not the "word of God," but only contains that "word," which it is the province of human reason to discover, and to separate from whatever accretions of fable, myth, symbolism, or error have grown over it through the agency of man or the lapse of time. This is properly the theological rationalism of modern times, and is held in Germany, France, Holland, England, and America by many divines, who, nevertheless, look upon themselves as essentially Christian in their creed. But as most investigators that proceed so far, take yet a further step, and deny the presence of any element other than human in the Bible, or that there is any satisfactory evidence of the truth of its alleged supernaturalism, the word rationalism has, in vulgar parlance, come to be synonymous with infidelity. It may also be added that the term rationalism is also employed in a restricted sense to denote the method of substituting for the miraculous and supernatural in Scripture, something considered reasonable—e.g., the miracle of the crossing of the Red sea is explained by the hypothesis that the Israelites crossed when the tide was out, while the Egyptians, hurriedly pursuing them, were taken in the returning waters. The leader of this school was *Paulus* (q.v.), whose system, after a time, gave way to the more scientific mythical theory of *Strauss* (q.v.).

RA TIOS, PRIME AND ULTIMATE. There can be little doubt that Newton discovered, by means of fluxions, of which he was in possession at a very early age, the greater part of that extraordinary series of theorems regarding motion, etc., which he

first published in the *Principia*. He had, however, a great partiality for the synthetic form of demonstration, employed with such success by the Greek geometers; and the consequence was that, in the *Principia*, he avoided entirely the use of analysis by fluxions, and invented for synthetical applications the closely allied method of prime and ultimate ratios. The fundamental idea involved in fluxions, prime and ultimate ratios, and the differential calculus, is the same, that of a *limit* (q.v.).

To give an idea of the nature, as well as to show the origin of the name, of the method, we may take a very simple case. Let a particle be projected in the direction AP; it will move uniformly in that line forever, unless deflected from it by some external force. See MOTION, LAWS OF. Suppose that gravity alone acts upon it, then (see PROJECTILES) it will describe a parabolic path, AQ, to which AP is the tangent at A; and the line PQ, which joins the disturbed and undisturbed positions of the particle at any instant, is vertical. Now, the lengths of AP and AQ are not, in general, equal, but they are more and more nearly equal as both are smaller; and, by taking each small enough, we may make the *percentage* of difference between them as small as we choose. In other words, their *prime ratio*, just at A, is unity. Again, the inscribed square is less than a circle; the octagon greater than the square, but less than the circle; the regular polygon of 16 sides greater than the octagon, but less

FIG. 1.

than the circle; and so on, constantly doubling the number of sides. But it can be shown that the difference of area between the polygon and the circle may be made as small a percentage of the area of the circle as we please, by making the sides of the polygon numerous enough. Hence, the *ultimate ratio* of the areas of the circle, and inscribed polygon with an indefinitely great number of equal sides, is unity.

The basis of the method, which is implicitly involved in the foregoing illustrations, is Newton's *first lemma*: "Quantities, and the ratios of quantities, which tend constantly to equality, and may be made to approximate to each other by less than any assignable difference, become ultimately equal." In other words, if we can make the *percentage* of difference of two quantities as small as we choose, we must produce ultimate equality.

From this, in his second and third lemmas, Newton proves the fundamental principle of the integral calculus as applied to the determination of the areas of curves, by showing that if a set of parallelograms, as in the figure, be inscribed in any curvilinear space,

FIG. 2.

the percentage of difference between the sum of their areas and that of the curve may be made as small as we please by diminishing indefinitely the breadth of each parallelogram, and increasing their number proportionally.

Next, he shows how to compare two curvilinear spaces, by supposing them filled with such parallelograms, each of the first bearing to one of the second a constant ratio.

Next, that the homologous sides of similar *curvilinear* figures are proportional.

The sixth lemma is merely a definition of continuous curvature in a curve, as distinguished from abrupt change of direction.

The seventh, eighth, and ninth lemmas are of very great importance. The general principle involved in their proof is this—to examine what occurs in indefinitely small arcs, by drawing a magnified representation of them such as always to be on a finite scale, however small the arcs themselves may be. Thus, to show that the chord of a small arc is ultimately equal to the arc—of which we have in trigonometry (q.v.) as a particular case, the ultimate equality of an arc and its sine—he proceeds somewhat as follows: Let AB be an arc of continued curvature, AC the tangent at A. Produce the chord AB till it has a *finite* length, Ab.

Describe on Ab, as chord, an arc similar to AB. This, by a previous lemma, will touch AC at A. Now, as B moves up to A, let the same construction be perpetually made, then b will approximate more and more closely to AC (because the arc AB is one of continuous curvature), and the magnified arc will constantly lie between AC and Ab. Hence, ultimately, when Ab and AC coincide in direction, the arc Ab (which is always between them) will coincide with Ab. Similarly, AD being any line making a finite angle with AC, draw DBE cutting off a finite length from AD; this process enables us to prove that the triangles AED, and the rectilinear and curvilinear triangles ABD, are all ultimately equal.

FIG. 3.

Finally (and this is the step of the greatest importance in the dynamical applica-

tions), if the lines AD, DE, D'E' be drawn under the above restrictions, the ultimate ratio of the curvilinear or rectilinear triangles AEB, AE'B' is that of the squares of corresponding sides. From this, in the ninth and last lemma, it is easily shown that the spaces described under the action of a finite force have their prime ratios as the squares of the times: whence we pass at once to the ever-memorable investigations of the *Principia* regarding the orbits described under the action of various forces.

The method of prime and ultimate ratios is little used now (except in Cambridge, which does honor to itself in making part of the *Principia* a subject of study), as the differential and integral calculus help us to the required results with far greater ease. But to the true student of natural philosophy, the synthetic method of Newton is of very great value, as it shows him clearly at every step the nature of the process he is carrying out, which is too apt to be lost sight of entirely in the semi-mechanical procedures common to all forms of symbolical reasoning.

• Fig. 4.

RAT ISBON. See REGENSBURG.

RAT LINES, or RATLINGS, are steps in the ladders by which sailors ascend from the deck to the mast-heads. They consist of thin cords fastened horizontally across the shrouds at an easy step apart, thus forming a convenient ladder. To prevent the ratline slipping, it is commonly tied to the shroud in a peculiar knot called a clove-hitch.

RAT-SNAKE, *Coryphodon Blumenbachii*, a serpent of the family *Colubridæ* (see COLUBER), which is often kept in a state of domestication in Ceylon, on account of its usefulness in killing rats. Like the rest of its family, it is destitute of poison-fangs. It is capable of being rendered very tame, and displays considerable intelligence.

RAT-TAIL MAGGOT, the larva of a dipterous insect, *eristalis tenax*, of the family *muscidae*. It inhabits mud, and breathes by means of tubes attached in telescope fashion to the tail, which terminates in a brush of hairs, and is always held up to the surface of the water, being elongated when the depth of water increases. The perfect insect is very like a bee.

BATTAN', RATAN, or ROTTANG, *Calamus*, a genus of palms very different in habit from most of the order; having a reed-like, slender, often jointed, and extremely long stem, sometimes even 1000 ft. or upwards in length. The name rattan is extended to others of the same tribe of palms, having the same general habit, although constituted by botanists into different genera. The stem, which is very smooth, and hard and silicious externally, is either erect, or ascends and descends among trees; often laying hold as it ascends by means of hooked prickles, the extremities of the midribs of its leaves, which are scattered at considerable intervals along its whole length, and envelop it by their sheathing stalks, and then descending in graceful festoons to climb again a neighboring tree. Sometimes, however, there are no leaves scattered along the stem. Sir James E. Tennent says, in his work on Ceylon: "I have seen a specimen 250 ft. long, and an inch in diameter, without a single irregularity, and no appearance of foliage other than the bunch of feathery leaves at the extremity." The leaves are always pinnate, and very beautiful. The fruit is a dry berry, covered with imbricated scales, and generally one-seeded.

The species are very numerous, all natives of the East Indies. A few species are found in the southern parts of India; but they abound along the southern foot of the Himalayas, in Chittagong, Silhet, Assam, the s.e. of Asia, and many of the islands of that region. They are all very useful, are much employed in their native countries, for making plaited work, ropes, etc., and are very largely imported into Britain and other parts of the world, generally under the name of *cane*, and chiefly in order to be used for plaited or wicker work.—Bridges of great strength are made, in some parts of the east, of the stems of these palms. They are twisted into ropes in some parts of the east, which are used for binding wild elephants, and for other purposes requiring great strength; the vessels of Java, Sumatra, and neighboring regions are very generally furnished with cables made of them, which are extensively manufactured at Malacca; and the Chinese make ropes of rattans by splitting them longitudinally, soaking them, and attaching them to a wheel, which is kept in motion, while new rattans are added, one by one, to increase the length of the rope.—The species called *calamus rudentium*, which has very long stems, is much employed in rope-making. Many species probably furnish the canes of commerce, one of which, *C. verus*, a native of India, is only about 20 ft. in length. The elegant walking-canes called *Malacca canes* are believed to be the produce of *C. scipionum*; the plant, however, does not grow in Malacca, but in Sumatra.—Small stems of rattan are used as a substitute for whalebone in umbrellas.—The fruit of some species of rattan is a delicate article of food; and the young shoots, variously dressed,

are equal to the finest of vegetables.—A very fine kind of *dragon's blood* (q. v.) is obtained from a species of rattan (*C. draco*), and particularly from the fruit, on the surface of which it appears as a resinous exudation. Various methods are employed for collecting it.

The canes of commerce are usually imported in bundles of 100 canes, each cane from 15 to 20 ft. in length; from 200,000 to 300,000 of these bundles are annually imported into Britain.

RATTANY, or **RHATANY**, *Krameria triandra*, a half-shrubby plant, of the natural order *polygalæ*, a native of the cold sterile table-lands of the Andes in Peru and Bolivia. It is called *ratanhia* in Peru. It is valued for the medicinal properties of the root, which are shared more or less by other species of the same genus, also natives of South America. The dried root is a powerful astringent, and a useful tonic; and is employed in mucous discharges, passive hemorrhages, and cases of relaxation and debility. It is also used as a tooth-powder, often mixed with orris root and charcoal. Rattany root is imported from different parts of South America, but chiefly from Lima. It is extensively imported into Portugal in order to communicate a rich red color to wines. The peculiar properties of rattany root are supposed to be chiefly owing to an acid called *krameriac acid*.

RATTAZZI, Princess **MARIE STUOLMINE DE SOLMS**, b. London, 1820; daughter of sir Thomas Wyse, who married Lætitia, daughter of Lucien Bonaparte. After the separation of her parents, Louis Philippe placed her in a royal school at St. Denis. She was married in 1850 to Frederic Solms, a wealthy Alsatian, but was separated from him in 1852. As she could not refrain from political intrigues, Napoleon III. objected to her residing in Paris, and she lived till 1860 in Savoy and Nice, devoting herself to literary pursuits under the name of Princess Marie de Solms. In 1860 she married Urbano Rattazzi, an Italian statesman, whose memoirs she has recently published. She is the author of many poems and dramas, and has edited several journals. Among her many novels, *Les Mariages de la Créole* and *Si j'étais Reine* are the most popular.

RATTAZZI, **UREANO**, an Italian statesman, was b. in the middle ranks of life, at Alessandria (Piedmont), in 1810. He was an advocate at Casale, where, in 1847, he was president of the agricultural committee. After the proclamation of the constitution in 1848, he was elected member for Alessandria, and began his political career as a democrat. His knowledge, eloquence, and liberal principles raised him to the ministry, and his first act was to write to the bishops, threatening to have them arrested if they should preach against liberty. He resisted his chief, Gioberti, who wished to send Piedmontese soldiers into Tuscany and Rome, to prevent the occupation of these places by the Austrians and French; urged Charles Albert into a new war with Austria, and after the defeat of Novara, was obliged to retire from the ministry. After Napoleon's *coup d'état*, the liberty of Piedmont was threatened, and Cavour, Rattazzi, and their parties joined together to defend it. This union was called *connubio*. Rattazzi took the portfolio of minister of justice in the Cavour ministry in 1854, and presented the bill for the abolition of convents. The priests were up in arms against him, and he was strenuously opposed by the Catholic party. After the Mazzinian movement in 1857, being accused of weakness in suppressing it, he retired. After the peace of Villafranca, he returned to the ministry. He did not wish to accept definitively the annexation of the duchies, because he knew that the price of it was Savoy and Nice, which he was unwilling to give up; and being, as is alleged, secretly undermined by Cavour and sir James Hudson, he fell. In 1862 Rattazzi was intrusted with the formation of a new ministry. His policy was an attempt to secure the development of Italian liberty and unity by peaceful and diplomatic means. He opposed Garibaldi's expedition against Rome in that year, so that its result was the disaster at Aspromonte. His ministry failed to secure the confidence of parliament, and he accordingly resigned at the end of the year 1862. He returned to office in 1867, but had to resign the same year. He died June 5, 1873.

RATTLESNAKE, *Crotalus*, a genus of serpents of the family *crotalide*, distinguished from the rest of that family by the rattle at the end of the tail. They are also characterized by having only one row of plates under the tail. The genus is subdivided by many authors according to the scales and shields with which the head is covered in different species. All the species are American, and are much dreaded for their deadly venom, although they seldom assail man, unless molested, and the rattle often gives timely warning of danger. The rattlesnake is often found at rest in a coiled form, with the rattle somewhat erected from the center of the coil; and when it begins to be irritated, the rattle shakes. Rattlesnakes are generally rather sluggish in their movements, but they are most active and most dangerous in the warmest weather, their bite being more formidable at such a time, as well as more readily inflicted. The effects of the bite are various, according not only to the condition of the serpent, but also according to the constitution of the person bitten, and the place into which the fangs have been inserted, the worst case being when the poison immediately enters a large vein, and so is carried at once to the most vital parts. Death to human beings has been known to ensue in a few minutes, while in other cases, hours or days have elapsed, and sometimes the sufferer recovers. Almost all animals show what may be deemed an instinctive dread of the rattlesnake, and a great unwillingness to approach it. Hogs and peccaries, however, are so far from regarding it with dread, that they kill and eat it, find-

ing safety from its venom probably not in any peculiarity of constitution, but in their thickness of skin, and the thickness of the layer of fat under the skin. Rattlesnakes are viviparous, and exhibit attachment to their young. It is said of them, as of the viper, that on the appearance of danger, the mother receives her young cubs into her mouth and gullet, or stomach, ejecting them again uninjured when the danger is past, but the same doubt attaches to the story as in the case of the viper. The power of fascination (q. v.) has not been more frequently ascribed to any kind of serpent.

The rattle is a very peculiar appendage. It consists of a number of thin horny cells, jointed together; each, except the terminal one, of a conical form, and in great part covered by that next to it, against the sides of which its apex strikes when the rattle is shaken, so as to produce a rustling or rattling noise. It is generally believed that the number of joints in the rattle increases with the age of the serpent, one being added at each casting of the skin. One species of rattlesnake (*Crotalus horridus*), sometimes called the CARCAVELA, is found in the warm parts both of North and South America. Its muzzle is covered by three or four pairs of plates. Its scales have a sharp elevated keel. It attains the length of 8 ft., although it is seldom found of so great a size. Its color is yellowish-brown above, with a broad dark streak on each side of the neck, and a series of broad lozenge-shaped spots on the back.—Another species, *Crotalus* or *Uropophis*, *durissus*, extends further northward as far as the southern shores of the great lakes. It is of a pale brown color, with a dark streak across the temples, and dark spots on the body, often assuming the form of bands; the keel of the scales not so strongly developed, and the muzzle with fewer shields than in the former species, which it resembles in size. A third species, *Crotalus* or *Crotalophorus* *milliaris*, having the head completely covered with large shields, is also common in many parts of North America, and is as much dreaded as either of those already named, notwithstanding its much smaller size, because the sound of its rattle is so feeble as not readily to attract attention. It is of a brownish-olive color, with brown spots on the back and sides, the belly black.—In the colder countries which they inhabit, rattlesnakes spend the winter in a torpid state, retiring for that purpose into holes, or hiding themselves among moss.

RATZ BOSZORMENY. See BÖSZORMENY.

RAUCH, CHRISTIAN DANIEL, one of the most distinguished German sculptors, was b. at Arolsen, the capital of the principality of Waldeck, in 1777. He early began the study of sculpture; but on the death of his father, in 1797, he was obliged to go to Berlin, where he became valet to Frederick William II., king of Prussia. On the death of that prince, Rauch determined to follow the bent of his inclination for the fine arts. In this he was assisted by the new king Frederick William III., who afforded him facilities for designing and modeling statues, and recommended him as a pupil in the academy of the fine arts. A statue of Endymion and a bust of queen Louise of Prussia executed at this time, convinced the king of Rauch's abilities, and he gave him the means of proceeding to Rome for his further improvement. Rauch spent six years in that city, working at his profession with much assiduity to render himself worthy of the friendship of Thorwaldsen and Canova. At Rome he also enjoyed the friendship of William Humboldt, at that time Prussian minister there.

Among his works at this time were bassi-relievi of "Hippolytus and Phædra," a "Mars and Venus wounded by Diomedes," a colossal bust of the king of Prussia, and busts of Raphael Mengs and the count de Wengersky. In 1811 he was called by the king of Prussia to Berlin to execute a monumental statue of queen Louise. This great work obtained for Rauch a European reputation. It is placed in the mausoleum of the queen in the garden of Charlottenburg. Rauch was not, however, quite satisfied with this triumph of his art, but commenced a new statue of the queen, which he finished 11 years afterward, and which is allowed to be a masterpiece of sculpture. It is placed in the palace of Sans Souci, near Potsdam. Rauch, after this, lived principally at Berlin, but occasionally visited Rome, Carrara, and Munich. He labored indefatigably in his profession, and by 1824 had executed 70 busts in marble, of which 20 were of colossal size.

Rauch's principal works, besides those above mentioned, are: two colossal bronze statues of field marshal Blücher, one of which was erected, with great solemnity, at Breslau in 1827; a bronze statue of Maximilian of Bavaria, erected at Munich in 1825; and statues of Albert Dürer, Goethe, Schiller, and Schleiermacher, erected in various places in Germany. His greatest work is the magnificent monument of Frederick the great, which adorns Berlin. The model for this statue was designed by Rauch in conjunction with prof. Schinkel, the architect, in 1830; and after 20 years' labor the statue was finished in 1850, and was inaugurated with great pomp in May, 1851.

In his works Rauch has the merit of having surmounted the difficulties which modern costume opposes to the ideal representation of personages of the present age; and, while he preserved the salient points of his model, he possessed the art of sacrificing the less important details to the exigencies of the beautiful. He died at Dresden on Dec. 3, 1857.

RAUCH, FRIEDRICH AUGUST, D.D., 1806-41; b. Germany. He studied at the university of Marburg, afterward at Giessen and Heidelberg. After holding a professorship at Giessen and then at Heidelberg for a short time, he sailed for America in 1831, as the

government objected to the free expression of his political opinions. In 1832 he was ordained to the ministry, and placed in charge of the classical school at York, Penn., connected with the theological seminary of the German Reformed church. In 1835 he was appointed president of Marshall college, where he died in 1841. He wrote *Psychology, or a View of the Human Soul*, and left an uncompleted work on *Christian Ethics*.

RAUHÉS HAUS is the name of a great institution founded and hitherto managed by Wichern at Horn, near Hamburg, in connection with the German home-mission (*innere mission*). It is partly a refuge for morally neglected children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, etc., in promotion of the objects of the home-mission. The first foundation of this model institution—for such it has become for Germany as well as for France—was laid by a wealthy citizen of Hamburg, who made over to it a piece of land. It was opened on Nov. 1, 1831, by Wichern with 12 morally neglected children. By the addition of new houses the whole has, however, been very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinder's shop, and bookselling form part of the institution. Recently about 100 neglected children (one-third are girls) receive their education in the establishment. They live in families of 12, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor, manual labor. The watching and care of these children devolve on assistants, who also take part in the instruction of the institution, with a view to prepare themselves for the work of the home-mission in other institutions. These instructors receive board and clothing, but no salary. In connection with the Rauhés Haus there was founded in 1845 a kind of conventual institute for the education of young men with a view to become heads or superintendents of similar institutions. Entrance into this institution is limited to the age of 20—30. Besides religious belief and good character, freedom from military duties, bodily and mental health, some scholastic acquirements, and a knowledge of some craft or of agriculture, are required. The boarding-school was established in 1851, and at the same time a seminary was founded, in which 12 brethren of the Rauhés Haus are especially prepared for school-work.

RAUMER, FRIED. LUDW. GEORG VON, a noted German historical writer, was b. on May 14, 1781, in Wörlitz, near Dessau; studied law and political economy at Halle and Göttingen; filled different law appointments (1806—11); and in the last-mentioned year was named professor at Breslau. In 1819 he was called to Berlin as professor of history and political economy. Among his writings may be mentioned: *Sechs Dialoge über Krieg und Handel* (1806); *Das Bröttische Besteuerungssystem* (Berl., 1810); *The Orations of Aeschines and Demosthenes de Corona* (Berl. 1811); *CCL. Emendationes ad Tabulas Genealogicas Arabum et Ptolemaei* (Heidelb., 1811); *Handbuch merkwürdiger Stellen aus den Lat. Geschichtschreibern des Mittelalters* (Handbook of Remarkable Passages in the Latin Historians of the Middle Ages, Bresl. 1813); *Vorlesungen über die alte Geschichte* (Lectures on Ancient History, 2 vols., Leip. 1847); *Geschichte der Hohenstaufen und ihrer Zeit* (History of the Hohenstaufen Dynasty and their Time, 6 vols., Leip. 1823—25); *Ueber die geschichtliche Entwicklung der Begriffe von Recht Staat und Politik* (On the Historical Development of the Ideas of Law, State, and Politics, 2d ed., Leip. 1832); *Prussian Municipal Law* (Leip. 1828); *Briefe aus Paris und Frankreich*, 1830 (2 vols., Leip. 1831); *Briefe aus Paris zur Erläuterung des Geschichte des 16th und 17th Jahrh.* (2 vols., Leip. 1831); *Geschichte Europas seit dem Ende des 15 Jahrh.* (History of Europe from the End of the 15th Century, vols. 1—8, Leip., 1832—50); *England*, 1835 (2 vols., Leip., 1836); *Englands*, 1841 (3 vols., Leip. 1842); *Beiträge zur Neuern Geschichte aus dem Brit. Museum, etc.* (5 vols., Leip. 1836—39); *Italien: Beiträge zur Kenntniss des Landes* (2 vols., Leip. 1840); *Die Vereinigten Staaten von Nordamerika* (2 vols., Leip. 1845); *Antiquarische Briefe* (Leip. 1851); *Handbuch zur Geschichte der Literatur* (1864—66). He also edited the *Historisches Taschenbuch*, etc. The unfavorable reception of an oration of Raumer in honor of king Frederick II. compelled him, in 1847, to resign the secretaryship of the academy of sciences at Berlin. Raumer was a member of the Frankfort parliament, where he belonged to the right center. Subsequently he became ambassador at Paris, and then member of the first chamber at Berlin. In 1853 he became professor emeritus at the university of Berlin. He died in June, 1873.

RAUMER, KARL GEORG VON, brother of the preceding, was b. April 9, 1783, in Wörlitz; studied from 1801 to 1805 at Göttingen and Halle, then at the mining academy at Freiberg, and was appointed professor of mineralogy at Breslau university in 1811. He took part as a volunteer in the war of liberation (1813—14), was translated in 1819 to the university of Halle; and finally, in 1827, was appointed professor of mineralogy and natural history in the university of Erlangen, where he died in 1865. Raumer obtained a wide reputation by his geographical and geological writings, among which are *Geognostische Fragmente* (Geognostic Fragments, Nürnberg, 1811); *Der Granit des Riesengebirges* (The Granite of the Riesengebirge, Berl. 1813); *Das Gebirge Niederschlesiens* (The Mountains of Lower Silesia, Berl. 1819); *A B C Buch der Krystallkunde* (The A B C of Crystallography, 2 vols., Berl. 1817; supplement, 1821). His interest in literary and scholastic education is evinced in his valuable *Geschichte der Pädagogik* (History of Pedagogy, 4

vols., Stuttg. 1846-55). Other works are his *Lehrbuch der allgemeinen Geographie* (Manual of Universal Geography, Leip. 1848); *Palestine* (Leip. 1850); *Beschreibung der Erdoberfläche* (Description of the Earth's Surface, 6th ed., 1866); and *Kreuzzüge* (1840-64). His autobiography appeared after his death, 1866.

RAUPACH, ERNST BENJ. SAL., a German dramatist, b. on May 21, 1784, in Straubitz (Silesia); received his education in the gymnasium at Leignitz; studied theology at Halle, was for ten years tutor in Russia, held lectures at St. Petersburg university, and was subsequently (1816) appointed there professor of philosophy, German literature and history. Raupach left Russia in 1822, and died at Berlin, Mar. 18, 1852. Among his early plays the following are noteworthy: *The Princes Chavansky* (1818); *Die Gefesselten* (The Enchained, 1821); *Der Liebe Zauberkreis* (The Magic Ring of Love, 1824); *Die Freunde* (The Friends, 1825); *Isidor und Olga* (1826); *Rafaele* (1828); *Die Tochter der Luft* (The Daughter of the Air, after Calderon (1829)). Among his comedies may be mentioned: *Créte and Antieritie*; *Die Schleichhändler* (The Smugglers); *Der Zeitgeist* (The Spirit of the Time); *Das Sonnett*; and the farces, *Denkan Cäsar* (Remember Cesar) and *Schelle im Monde*. Of his posthumous works, the principal are: *Jacobine von Holland* (1852); *Der Kegelespieler* (The Player at Nine-pins); the tragi-comedy, *Mulier tacet in Ecclesia* (1853); and *Seed and Fruit* (1854). Raupach's writings display great knowledge of stage effect, a happy talent for the invention of new and interesting situations, a power of vivid dramatic diction, and a fine play of verbal wit.

RAUSCHER, JOSEPH OTTMAR VON, 1797-1875; b. Vienna; studied law; abandoned it for theology; ordained priest in 1823; vicar at Hütteldorf; professor of canon law and church history at Salzburg; in 1832 director of the Oriental academy at Vienna; subsequently filled various offices, one of which was that of instructor of the present emperor and his brothers. In 1849 he was appointed bishop of Seckau, and in 1853 was raised by the emperor to the archiepiscopal see. In this position he was appointed by the emperor to negotiate a concordat between Austria and the Roman see. For this he was made cardinal the same year.

RAVAILLAC, FRANÇOIS, a native of the French province of Angoulême, where he was b. in 1578, has acquired an obnoxious reputation as the murderer of Henri IV. of France. In early life Ravaillac was in turn clerk to a notary and master of a school; but having fallen into debt, he was thrown into prison, the confinement and restraint of which preyed upon his health, and produced hallucinations of mind. Under the influence of this mental excitement, he renounced all secular pursuits; and on his release from prison, after having served for a time in the order of the Feuillants, he fell under the influence of the Jesuits, through whose instrumentality it is believed that his insane hatred of the Huguenots, as the enemies of the church, was directed more especially against Henri of Navarre, their former leader. Having resolved to assassinate the king, he eagerly watched his opportunity, and on May 14, 1610, as the king was passing in his coach through the narrow street of Laferrière, got upon the right hinder-wheel of the carriage at the moment that its further advance was hindered by a heavy wagon in front of it, and leaning forward, he plunged a knife into the breast of the king. The first blow glanced aside, but at the second thrust the knife entered the heart. Ravaillac escaped in the confusion, but being soon captured with the knife still in his hand, he admitted his guilt; and having been formally tried and condemned, he was put to the torture; and suffered death on May 27, in the Place de Grève, under circumstances of great cruelty, his body being torn asunder by horses. Ravaillac refused to the last to acknowledge whether he had had instigators or abettors, and hence the widest scope was given to conjecture, suspicion being in turn directed to the queen, Marie de' Medici, and her favorites, the Concini, to the duc d'Epéron, and to the Spanish court and their Jesuit advisers, but there is no good ground for such suspicions. M. Henri Martin (*Histoire de France*) and M. Poirson (*Histoire de Henri IV., tome II.*) have examined the particulars of the process instituted against Ravaillac with scrupulous impartiality, and have come to the conclusion that the real cause of the crime was fanaticism degenerated into monomania.

RĀVANĀ (from the causal of the Sanskrit *ru*, cry, alarm, hence literally he who causes alarm) is the name of the *Rākshasa* (q.v.) who, at the time of Rāma, ruled over Lankā or Ceylon, and having carried off Sitā, the wife of Rāma, to his residence, was ultimately conquered and slain by the latter. Rāvan'a is described as having been a giant with ten faces, and in consequence of austerities and devotion, as having obtained from Sīva a promise which bestowed upon him illimited power, even over the gods. As the promise of Sīva could not be revoked, Vish'n'u evaded its efficacy in becoming incarnate as Rāma, and hence killed the demon-giant. See under VISIN'U and RĀKSHASA.

RAVELIN, in fortification, is a triangular work of less elevation than the main defenses, situated with its salient angle to the front before the curtain, which with the shoulders of the adjoining bastions it serves to protect. It is open at the rear, so as to be commanded by the curtain, if taken, and is separated from that work by the main ditch, while in its own front the ditch of the ravelin intervenes between itself and the covert-way. The guns of the ravelin sweep the glacis, and perform a very important function in commanding the space immediately before the salient angles of the two next bastions, ground which the guns of the bastions themselves cannot cover. The bastions, on the

other hand, flank the ravelin. In the fortifications of Alessandria, designed by Bousmard in 1803, the ravelins are placed in front of the glacis.

The original name of the ravelin was *riellino*, which indicates a derivation from *vegliare*, to watch, the ravelin having probably been at first a watch-tower, answering to the still earlier barbacan.

RAVEN, *Corvus corax*, a species of crow (q.v.), remarkable for its large size. It is more than 2 ft. in length from the tip of the bill to the extremity of the tail. The bill is thick and strong, compressed at the sides, the mandibles sharp at the edges; the upper mandible curved at the tip, and exceeding the lower in length. The base of the bill is surrounded with feathers and bristles. The tail is rounded, but the middle feathers are considerably the longest. The wings are long—extending from tip to tip to 52 in.—the fourth quill-feather being longest. The color is a uniform black, with more or less of metallic luster, which is particularly conspicuous in the elongated throat-feathers of the male, and is wanting in the whole plumage of the female and young.

The raven is a bird of wide geographic distribution. It is found in almost all parts of the northern hemisphere, but most abundantly in the more northern and the mountainous parts of it. In other parts of the world, and within the northern hemisphere itself, however, other closely allied species have probably been often mistaken for it. There are several species of crow very similar to the raven in color, size, and habits.

The raven is generally to be seen either solitary or in pairs. It is one of the most thoroughly omnivorous of birds. It feeds on fruits and nuts in forests; it picks up worms or mollusks; it sucks eggs; it kills young hares, or even lambs; it rejoices in carrion, and not unfrequently attacks weak or sickly beasts, almost invariably choosing their eyes as its first point of assault. It generally makes its nest of sticks, coarse weeds, wool, hair, etc., in rocky places, on a narrow ledge of a precipice, or in some similar situation. Ravens are occasionally captured when young, and become interesting pets, being remarkable for their impudence and cunning, their look of sage thoughtfulness, their inquisitiveness, their mischievous propensities, which prompt them to destroy everything that can be destroyed, and always as if the fact of its destruction afforded them pleasure, their thievishness, their love of glittering things, and their power of imitating human speech, which is almost equal to that of parrots. The raven is celebrated for its longevity, and instances are on record of ravens which have certainly lived for 70 or 80 years. The raven has been generally reckoned a bird of ill-omen, probably on account both of its color and its extremely harsh croaking voice, which may sometimes be heard in fine weather as if coming from the sky, the raven being a bird of powerful wing, and often soaring very high in the air.

RAVENNA, a province of n. Italy, in the compartment of Emilia: having Ferrara on the n., Bologna and Tuscany on the w., Forlì on the s., and the Adriatic sea or gulf of Venice on the e.; 742 sq. m.: pop. 221,115. Its surface in the e. is low and marshy; in the w. and at the foot of the Apennines it is more elevated, having a soil well under cultivation, producing corn and hemp. Cattle are raised, and salt is made from the lagoon of Cervia. It is drained by the Santerno, the Senio, the Lamone, the Montone, and the Ronco rivers, and has a canal connecting its capital with the Adriatic. It is traversed by a highway from Faenza, one of its chief cities, across the Apennines into the valley of the Sieve. The products of the leading manufactures are silk, wine, oil, and cream or tartar. Capital, Ravenna.

RAVENNA, an important city of central Italy, 43 m. e.s.e. from Bologna, and 4½ m. from the Adriatic; lat. 44° 24' n., long. 12° 12' east. Pop. '72, of the commune, 58,104; of the town proper, 21,000. It is situated in the midst of a well-watered, fertile, and finely-wooded plain. Ravenna is surrounded by old bastions, and by walls where may still be seen the iron rings to which the cables of ships were formerly fastened; the sea is now at the distance of about 4 m. from the city. The streets are wide; the squares are adorned with statues of the popes, and the houses have a gloomy appearance. Ravenna is an ancient city, rich in monuments of art. The cathedral, built in the 4th c., was almost wholly rebuilt in 1734; it has 5 naves, supported by 24 marble pillars. Of the other 14 churches and other architectural antiquities several date from the 5th and 6th centuries. San Francesco possesses the tomb of Dante, erected in the 15th century. The library of Ravenna contains 50,000 volumes. It has an archaeological museum, and many educational institutions. Ravenna has manufactures of silk, and its trade is facilitated by a canal to the sea.

Ravenna was probably of Umbrian origin; it was at least an Umbrian city when it passed into the hands of the Romans. Augustus made it a first-class seaport and naval station; 400 years later, the emperor Honorius took refuge there, and made Ravenna the capital of the empire. The city was taken by Odoacer, then by Theodorich and by Totila; the latter was conquered by Narses, who made it the residence of the exarchs in 553. In 1218 it became a republic. In 1275, Guido da Polenta conquered it, and there established his court, where he received Dante. Ravenna was afterward taken by the Venetians, who kept it till 1509. Under Charles V. it passed into the hands of the popes.

Under the walls of Ravenna, a great battle was fought in 1512 between the French and the Spaniards, in which Gaston de Foix purchased victory with his life.

RAVENSBURG, a t. in Württemberg, and capital of a bailiwick of the same name, in the circle of the Danube, is pleasantly situated in a fertile and romantic valley, the Schussenthal, at the foot of a hill planted with vines. The principal industries are spinning wool and flax, weaving woolen fabrics, linen, and stockings, bleaching, making paper, playing-cards, furniture, wood-work, sawing wood, etc. Pop. '75, 10,634.

RAVENS-CROFT, THOMAS, an eminent English musical composer. He was b. in 1592, received his musical education in St. Paul's choir, and had the degree of bachelor of music conferred on him when only 15 years of age. In 1611 appeared his *Melismata*, *Musical Phantasies*, etc., a collection of 23 part-songs, some of them of great beauty; and three years later he brought out another collection of part-songs under the title of *Brief Discourses*, with an essay on the old musical modes. Turning his attention to psalmody, he published, in 1621, a collection of psalm-tunes for four voices, entitled *The Whole Book of Psalms, composed into Four Parts by Sundry Authors to such Tunes as have been and are usually sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands*. This was the first publication of its kind, and all similar works of later date have been largely indebted to it. Among the contributors to this collection were Tallis, Morley, Dowland, and all the great masters of the day; the name of John Milton, the father of the poet, appears as the composer of York and Norwich tunes; while St. Davids, Canterbury, Bangor, and many others which have since become popular, are by Ravenscroft himself. Each of the 150 psalms has a distinct melody assigned it. Two collections of secular songs similar to the *Melismata*, and entitled *Panmelia* and *Deuteromelia*, have been assigned to Ravenscroft; but it is probable that only a few of these songs were composed by him, while he may have revised and edited the whole. A selection from the *Melismata*, *Brief Discourses*, *Panmelia*, and *Deuteromelia* was printed by the Roxburgh club in 1823. Ravenscroft died about 1640.

RAVIGNAN, GUSTAVUS FRANCIS XAVIER DELACROIX DE, a celebrated preacher of the Jesuit order, was b. at Bayonne, Dec. 2, 1795. He studied in the Lycée Bonaparte at Paris, and having embraced the legal profession, and obtained his degree, was named auditor of the Cour Royale at Paris, and afterward, in 1821, received an appointment in the tribunal of the Seine. The prospect thus opened for him, however, soon lost its attraction, and in 1822 he formed the resolution of relinquishing his career at the bar, and entering the church. Having spent some time in the college of St. Sulpice, he soon passed into the novitiate of the Jesuits at Montrouge, and thence to Dole and St. Acheul for his theological studies, at the termination of which he was himself appointed a professor. On the expulsion of the Jesuits from France, in 1830, Ravignan withdrew to Freiburg in Switzerland, where he continued to teach in the schools of his own order; but after some time he was transferred to the more congenial duty of preaching, first in several of the Swiss towns, and afterward in Savoy, at Chambéry, at St. Maurice, and other places. At length, in 1835, he appeared in the pulpit of the cathedral of Amiens. In the following year he was chosen to preach the Lenten sermons at the church of St. Thomas d'Aquin in Paris; and finally, in 1837, was selected to replace Lacordaire (q.v.) at Notre Dame, in the duty of conducting the special "conferences" for men which had been opened in that church. For ten years Père de Ravignan occupied this pulpit with a success which has rarely been equalled, and his "conferences" are regarded as models of ecclesiastical eloquence. In 1842 he undertook in addition to preach each evening during the entire Lent; and it is to the excessive fatigue thus induced that the premature break-down of his strength is ascribed. To the labors of the pulpit he added those also of the press. He published an apology of his order in 1844; and in 1854 a more lengthened work with the same view, *Clement XIII. et Clement XIV.*, 2 vols. 8vo, which was intended as a reply to the *Life of Clement XIV.*, by the Oratorian father Theiner. These, with some occasional sermons and "conferences," constitute the sum of the publications issued during his life. In 1855 he was invited by the emperor Napoleon III. to preach the Lent at the Tuileries. On Feb. 26, 1858, he died in the convent of his order at Paris, in his 63d year. His memoirs have been published by his brethren, and a collected edition of his works and remains has been for some time in progress.

RAVINALA. See TRAVELER'S TREE.

RAWAL PINDI, a large walled t. of the Punjab, in the doab between the rivers Indus and Jhelum. It contains a large bazaar, and carries on an active transit-trade between Hindustan and Afghanistan, but is not otherwise noteworthy. Pop. '68, 19,222.

RAWDON, LORD. See HASTINGS, FRANCIS.

RAWICZ, a t. of Prussia, in the government of Posen, close to the Silesian frontier, 64 m. s. of Posen by railway. It is surrounded by walls. Spinning, weaving, brewing, manufactures of tobacco and leather, and a considerable trade, are carried on. Pop. '72, 10,671.

RAWLE, WILLIAM, LL.D. 1759-1836; b. Philadelphia; educated at the college of New Jersey. He studied law in New York, London, and Paris, and in 1783 began to practice in Philadelphia. He was a member of the legislature 1789, and U. S. district attorney 1791-99. He was the first president of the Pennsylvania historical society. He

framed the new civil code for Pennsylvania, and wrote *A View of the Constitution of the United States*, 1829.

RAWLINS, a co. in n.w. Kansas, having the state line of Nebraska for its n. boundary; drained by Beaver creek and the North and South forks of Sappa creek; 1050 sq.m.; pop. '80, 1623—1332 of American birth. Numerous creeks and rivulets flow through it from the Republican fork of the Kansas river, making a fertile agricultural region, well-timbered and affording excellent pasturage.

RAWLINS, JOHN A., 1831—69; b. Guilford, Ill.; farmer until 1854; studied law at Galena, and established a successful practice before the rebellion, in which he served on the Union side as assistant adj. gen., rank of capt., on gen. Grant's staff through the campaigns of 1862 and 1863, and was made chief of staff in 1865, ranking as brig. gen. in the regular army. He was secretary of war 1869.

RAWLINSON, SIR HENRY, K. C. B., oriental scholar and diplomatist, was b. at Chaldington, Oxfordshire, in 1810, and educated at Ealing, Middlesex. He entered the East India military service in 1826, and served in the Bombay presidency until 1833, when he was appointed to assist in reorganizing the army of the shah of Persia. He had early devoted himself to eastern languages and antiquarian researches, and when stationed at Kermanshah, in 1835, he began to study the cuneiform (q. v.) inscriptions of Persia. He announced his cuneiform discoveries in 1837—38 to the Royal Asiatic society of London, and published his travels in Susiana in the *Geographical Society's Journal*. He also made a translation of the Behistun inscription, a most important event in the history of the study of the old Persian languages. After residing as political agent at Candahar (1840—42) and Bagdad (from 1843), he returned to England with the rank of consul-general in 1855. In Jan., 1858, he was elected M. P. for Reigate, but vacated the seat in September, on being appointed a member of the council of India. In 1859 he proceeded to Teheran as envoy-extraordinary and minister-plenipotentiary to the court of the shah. He was returned to parliament as member for Frome, and retained his seat till the general election of 1868. In 1871 Rawlinson became president of the Royal geographical society, an office which he retained until June, 1873. Rawlinson is the author of a large number of most valuable papers on geography, archaeology, history, and modern politics, chiefly connected with Persia and the surrounding countries. The greater number of these have been read to learned societies, but others have appeared in periodical publications. He is also the author of a work entitled *England and Russia in the East* (1875). Rawlinson has not confined his attention to eastern subjects, and his addresses to the geographical society, and on geography and history generally to the Midland institute at Birmingham, on Oct. 6, 1873, show how varied and extensive his acquirements are. Rawlinson was admitted as corresponding member of the institute of France in 1837, and in 1851 was made chevalier of the order of merit by the king of Prussia.—RAWLINSON, REV. GEORGE, brother of the preceding, graduated at Oxford, and was elected a fellow and tutor of Exeter college. Appointed Bampton lecturer in 1839, he published his lectures in the following year under the title of *Historic Evidence for the Truth of Christian Records*. Other works of Rawlinson's are an edition of Herodotus, in which many of his brother's discoveries are incorporated; *The Five Great Monarchies of the Ancient World—Chaldea, Assyria, Babylonia, Media, and Persia; Manual of Ancient History* (1859); *The Sixth Oriental Monarchy—Parthia* (1873); and the *Seventh Oriental Monarchy—the Sassanians* (1875).

RAWSON, ALBERT LEIGHTON, b. Vt., 1829; visited Palestine and other eastern countries; traveled, in 1851—52, from Cairo to Mecca with the pilgrims, under the disguise of a Mohammedan medical student. He published, *The Divine Origin of the Holy Bible; The Pronouncing Bible Dictionary; History of all Religions; Statistics of Protestantism; Antiquities of the Orient; Grammar of the Turkish and Arabic Languages*.

RAWSON, EDWARD, 1615—93; b. England; settled in Newbury, Mass., in 1636; represented that town in the general court for several years, was clerk of that body, and secretary of the Massachusetts colony. He published *The General Laws and Liberties Concerning the Inhabitants of the Massachusetts*.

RAY, *Raiia*, a Linnæan genus of cartilaginous fishes, belonging to the order *plagiostomi* (q. v.) of Müller, and now divided into a number of genera, which form the family *raiidæ* of many naturalists, and the suborder *raie* of some. The true rays have a flat body; the pectoral fins are large and fleshy, appearing as lateral expansions of the body, and along with it forming a circular disk or a rhomboid, to which is attached a rather long and slender tail. The pectoral fins are prolonged till they meet in front of the snout, and backward till they join the ventral fins. The eyes look upward, and the spout-holes or spiracles are also directed upward. The gill-openings, which are five in number, are on the under side of the body, where also the mouth is situated. The gills are close behind the mouth; and toward the tail are the stomach, intestines, and other viscera, in a circular cavity. The males are furnished with claspers. The eggs are large, resembling those of sharks, but more rectangular in form; thin horny cases, with projections at each of the four corners, having such a resemblance to a hand-barrow, that on some parts of the English coast they receive the name *skate-barrowers*. They are also familiarly known as *purses*, and are very often to be seen cast up by the waves upon the beach. Rays live

mostly near the bottom of the sea, and where the bottom is sand or mud. When disturbed, they glide in an undulating manner, and defend themselves against assailants by lashing with the tail, which is generally armed with spines, and in some species—called *sting rays* (q. v.), the family *trygonidae* of some naturalists—carries a single long and strong spine, notched on both sides, a formidable weapon, which is used somewhat as a saw. Rays are very voracious; they devour fishes, mollusks, and crustaceans. Many of the rays are popularly called SKATE. All of them are edible; some, however, are much better than others; and whilst, on some parts of the British coast they are regularly used for food, and brought to market, on other parts of the coast, they are rejected, and are thrown out to rot on the beach. Of British species, two of the most common are the thornback (q. v.) and the homelyn (q. v.). Another is the common skate, also called the blue skate or gray skate (*raia batia*), which is better than either the thornback or homelyn as an article of food. The long-nosed skate (*R. mucronata*) and the white skate (*R. oxyrhynchus*) are also common. The skates sometimes attain a very large size, more than 8 ft. in breadth.—*Torpedo* (q. v.), *cephaloptera* (q. v.), etc., are genera of rays.

RAY, a co. in n. w. Missouri on the n. bank of the Missouri river, drained also by Crooked and Fishing rivers; traversed by the St. Louis, Kansas City and Northern railroad, and its St. Joseph branch; 570 sq. m.; pop. '80, 20,193—19,765 of American birth. Surface partly prairie and partly woodland; tobacco, corn, oats, wheat, sorghum, and wool are staples. Sheep, horses, and cattle are raised in great numbers. Coal and limestone are found. Co. seat, Richmond.

RAY (or, as he himself occasionally spelled it, WRAY), JOHN, an eminent naturalist, was b. at Black-Notley, near Braintree, in Essex, Nov. 29, 1627. He went to Cambridge university, where, after having finished his course, he was elected a fellow, and appointed Greek lecturer, and afterward mathematical tutor in Trinity college; but after a time began to devote himself entirely to the study of natural history. Accompanied by a kindred spirit, Francis Willughby, a friend and former pupil of his own, Ray traveled over most of the United Kingdom, collecting and investigating botanical and zoological specimens, and in 1663 they started on a tour through the Low Countries, Germany, Italy, and France, with a similar object. Willughby taking the zoology under his charge, leaving Ray the botany. In 1667 Ray was elected a fellow of the Royal society, to whose *Transactions* he occasionally contributed valuable papers. In 1672, his friend Willughby, with whom Ray had lived ever since he had left the university, died, leaving him guardian to his two sons (the younger of whom was afterward raised to the peerage as baron Middleton), an office which Ray discharged, and then, after several changes of residence, settled down in his native village, where he died, Jan. 17, 1705. As a botanist and zoologist, Ray ranks very high, being distinguished for his patience, acuteness, and sagacity; and in knowledge he seems to have been far in advance of his time, as the new method of classification of plants which he proposed, though little appreciated or adopted by his contemporaries and immediate successors, was eagerly laid hold of by Jussieu and others, under whose hands it became the foundation of what is now known as the "natural system" of classification. Ray's zoological works are considered by Cuvier as the foundation of modern zoology. In zoology, as in botany, Ray's works are remarkable for the precision and clearness of the classification which he adopts, his divisions in the former subject being founded on the structure of the heart and the organs of respiration. The chief of his works on botany are *Methodus Plantarum Noeæ* (1682, 2d ed., revised and amended by himself), in which he details the principles of his new method of classification of plants; *Catalogus Plantarum Angliæ* (1670), the basis of all the subsequent floras of this country; and a second (1677), third (1690), and fourth (1696) edition of which were published by himself; *Historia Plantarum* (3 vols. 1686-1704), a compilation, including descriptions of all the species which were then known. His zoological works include the *Synopsis Methodica Animalium Quadrupedum et Serpentina Generis* (1693), and three posthumous volumes on birds, fishes, and insects, published by Dr. Derham. He was also the author of some theological works. His friend Willughby having collected the materials for an extensive work on the animal kingdom, left to Ray the task of arranging and classifying them, and the work accordingly appeared in 3 vols., the *Ornithologia* in 1676, with an English translation by Ray in the following year, and the *Historia Piscium* in 1686 (2 vols.). In these volumes were described a large number of species of birds and fishes, which had escaped the observation of previous naturalists.

RAYMOND, HENRY JARVIS, LL. D., 1820-69; b. N. Y.; son of a farmer in Lima, N. Y.; passed his younger days on his father's farm. He graduated at the university of Vermont in 1840, and studied law in New York, in the mean time supporting himself by contributing sketches to the *New Yorker*, a literary weekly, and teaching. In 1841, on the establishment of the *New York Tribune*, Mr. Raymond was attached to the editorial staff, but distinguished himself specially by the ability which he manifested as a reporter. In this profession he became quite unrivalled, his accuracy being unquestioned. In 1848 he transferred his services to the *Courier and Enquirer*, which connection he maintained until 1851; at the same time, and until 10 years later, filling a literary position in the house of Harper & Brothers, publishers. In 1849 he was elected by the whig party to the state legislature, and re-elected in the following year, when he was chosen speaker; in 1851 he visited Europe. Sept. 18, 1851, he published the first number of the *New York*

Times. In 1854 he was elected lieut. gov. of the state, and took a prominent part in the canvass for Fremont in 1856, and for Lincoln in 1860. He was an ardent supporter of the union cause during the war. In 1864 he was elected to congress, where he supported president Johnson's reconstruction policy. Mr. Raymond was first among American journalists. He was in Italy during the Franco-Austrian war in 1859, and gained high repute for his account of the battle of Solferino, which was remarkable both as a specimen of vivid writing, and as an extraordinary journalistic victory, the *Times*, in this instance, beating all its competitors. Mr. Raymond was the author of *A History of the Administration of President Lincoln*, 1864; *A Life of President Lincoln*, 1865; and *Life of Daniel Webster*, 1853. His death was sudden, and was attributed to overwork.

RAYMOND, JOHN HOWARD, LL.D., 1814-78; b. New York; studied in Columbia college; graduated at Union college in 1832; studied law at New Haven, but while there his religious views and character were changed, and he resolved to enter the ministry; returned in 1835 to Hamilton, and entered the institute, now Madison university. He was ordained; declined several important pastorates, and gave himself to teaching. After holding professorships in Madison university, he accepted, 1851, a professorship in Rochester university, but was soon called to the Brooklyn polytechnic institute. In 1854 he became president of Vassar college, filling also the chair of mental and moral philosophy, where he remained until his death. He was distinguished as an organizer, was pleasing and dignified in manner, original and energetic as a teacher. The college greatly prospered under his direction.

RAYMOND, ROSSITER WORTHINGTON, b. Ohio, 1840; graduated at the Brooklyn polytechnic institute in 1858. After spending three years in study at Heidelberg, Munich, and Freiberg, he began practice in 1864 in New York as a consulting engineer. Since 1867 he has been connected with mining journals, and in 1870 was appointed lecturer in Lafayette college on economic geology. In 1871 he was elected vice-president of the American institute of mining engineers, and 1872-74 was its president. He has published annual reports of mining statistics, 1869-75; *The Children's Week*; *Brave Hearts*; *The Man in the Moon*; and other stories.

RAYNAL, GUILLAUME THOMAS FRANÇOIS, 1713-96; b. France; educated for the priesthood with the Jesuits of Pézénas. In 1747 he went to Paris, and was attached to the church St. Sulpice as a poor Bohemian ecclesiastic. It is told that at this time, while the minimum price of a mass by the abbé Prevost was 20 sous, and a cheaper one was offered by the abbé Laporte at 15 sous, Raynal closed the market at 8 sous. His peculiarities soon led him out of the church, and he became one of the editors of the *Avenire de France*, where his thoroughly philosophic mind found associates and scope, and his taste for history made him a historian. His works, though not now of high value, were conspicuous in their time, when philosophy and literary independence were novelties. Among his works were *Histoire Philosophique et Politique des Établissements, et du Commerce des Européens dans les deux Indes*, which contained writings of Diderot as well as Raynal. The work was so full of disrespect of priesthood and superstition that it fell under the condemnation of the parliament, which in 1781 ordered the book to be burned, the author arrested, and his property confiscated; which, however, was not done. Raynal, who had by this time become renowned for the democratic philosophy of his works, traveled to England, Germany, and Russia, and was received with distinction by the classes whose status was to be undermined by his principles. He was elected to the states-general at the beginning of the French revolution in 1789, but was already near his dotage, and made no figure in the great events which followed.

RAYNOUARD, FRANÇOIS JUSTE MARIE, a French poet and philologist, was b. at Brignoles, in Provence, Sept. 8, 1761. He studied at Aix, and came to Paris to cultivate literature at the age of 23, but soon went back to the south, and joined the bar at Draguignan, where he acquired a high reputation. In 1791 he was elected a member of the legislative assembly; but after the fall of the Girondins, whose opinions he shared, he was thrown into prison, and fortunately forgotten. Released from confinement after the fall of Robespierre, he resumed his profession of advocate, and in the course of five or ten years, acquired a modest competency. He then returned to Paris, and devoted himself anew to literary pursuits. His first poem, *Socrate au Temple d'Aglaure* (Par. 1803), was followed by the tragedies, *Éléonore de Bavière* and *Les Templiers*, the latter of which was brought on the stage in 1805, and met with unbounded success. Two years later Raynouard was chosen a member of the academy, of which he became perpetual secretary in 1817. He had been made a member of the imperial legislative body in 1806, and Napoleon, it is said, even meditated appointing him to the presidency, but could not get over Raynouard's brusque manner and fearless independence of spirit. The principal dramas which he wrote during the régime of Napoleon, beside those already mentioned, are *Scipio*; *Les Etats de Blois*; *Don Carlos*; *Charles I.*; *Deborah*; *Jeanne d'Arc à Orléans*. Toward the fall of the empire his attention was turned to linguistic studies, particularly to the study of the Provençal language and literature; and his researches into the origin, grammatical rules, and transformations of the Romance tongue, led to many valuable discoveries, though his theories as to the relation of the language of the troubadours to the other tongues derived from Latin, have been shown to be erroneous (see ROMANIC LANGUAGES). His chief writings in this department are—*Eléments de la*

Grammaire Romane (Par. 1816); *Choix de Poésies Originales des Troubadours* (Par. 6 vols., 1816-21); *Grammaire comparée des Langues de l'Europe Latine dans leur Rapports avec la Langue des Troubadours* (Par. 1821); *Observations Philologiques sur le Roman du Rou (Rouen, 1829)*; *Influence de la Langue Romane* (Par. 1835); and *Lerique Roman, ou Dictionnaire de la Langue des Troubadours* (Paris, 6 vols., 1838-44). Raynouard died at Passy, near Paris, Oct. 27, 1836.

RAZOR, the sharp-bladed instrument used for shaving the beard, has been in use from very ancient times; it is alluded to by Homer, and shaving was in fashionable use by the Greeks and Romans (see **BEARD**), as a mark of civilization. Razors are almost universally metal blades, made exceedingly sharp; but an exception to this is found in some of the razors used by savage nations, as, for instance, the Tahitians, who use pieces of shells and sharks' teeth, upon which they grind very fine edges, sufficiently sharp to remove the beard. The Chinese and Japanese, who shave the head as well as the chin, use razors similar to the European, except that they rarely have handles. The steel of which they are made is of a remarkably fine quality.

The manufacture of razors in Great Britain is chiefly carried on in Sheffield, which place also supplies a large export trade. Great care is exercised in choosing the steel for making the blade, but, notwithstanding this, there is scarcely an article made by cutlers which is so uncertain in quality when used. Nearly 20 operations are required to produce a razor; nevertheless, such is the perfection to which manufactures are brought by a division of labor, and the application of machinery, that the razors supplied to the army (at the contract price of 4½d. each) cannot be surpassed for quality.

RAZOR-BILL, or **RAZOR-BILLED AUK**, *Alca torda*, a species of auk (q. v.), also called the black-billed auk, very common on the coasts of Britain, and of all the northern parts of the Atlantic ocean, frequenting lofty precipices, from which its eggs are taken, with those of guillemots, etc., by persons who are let down by ropes for that purpose. The eggs are esteemed a delicacy; and the flesh of the bird itself is much used for food. Great numbers of razor-bills are annually killed for the sake of their feathers, particularly on the coast of Labrador, where they are extremely abundant. The razor-bill is about 17 in. long, from the extremity of the bill to that of the tail. It is a very fierce bird, and, if seized, will lay hold of the hand in return, and submit to be choked ere it will let go. The egg is about three inches long. The bird lays one or two, upon ledges of rock or in fissures.

RAZOR-FISH, or **RAZOR-SHELL**. See **SOLEN**.

RAZOR-STROP, an article used for the purpose of sharpening razors. It usually consists of a piece of wood, an inch and a half broad, and 10 or 12 in. long, upon each side of which is glued a piece of leather; one of the pieces of leather is usually dressed with a composition of carbonate of iron and grease, which is used first, and the sharpening is finished on the undressed leather of the other side. A leathern strop is frequently used without fixing on wood. In the West Indies razor-strops are commonly made of pieces of the wood of *yucca gloriosa*, *eriolendron anfractuosum*, *agave viripara*, *ochroma lagopus*, and *anona palustris*, all of which contain minute deposits of silica in their cellular structure, which render them very efficient for the purpose. Species of *boletus* are so used in Britain.

REACTION, a term used in reference to the political history of a nation, to designate that tendency, often showing itself, to recoil from the effects of reform or revolution, and to seek a restoration of the previous state of things, or even of one still more antiquated and despotic. The causes that lead to reaction are various. Sometimes it springs, partly at least, from mere disappointment at the smallness of the *visible* results of those changes advocated with so much eloquence, and waited for with so much enthusiasm and hope. The inconsiderate imagination of the people expects a millennium to follow every important change; and when, after the event, men find they are still in the old world of imperfections, hardships, and sorrows, they are prone to believe that they have been deluded, and are only too willing to lend an ear to the insidious misrepresentations of those who are opposed to all progress. But more frequently political reaction springs from immature, or injudicious, or extravagant revolution. The times are not yet ripe (as in the first Italian revolts), or the leaders are unfit (as in the German and Hungarian struggles of 1848-49), or excesses are committed (as in the great French outbreak of 1789), and so a revolution is nipped in the bud, or overthrown on the battlefield; or, inflamed with sanguinary thirst of revenge, it goes mad in a "reign of terror," and exhausting itself in unprofitable frenzies, falls at last an easy prey to any bold and unscrupulous adventurer whom the crowd may elect out of desperation and disgust of anarchy, and whose rule is as absolute as any that preceded it. A reaction may thus, in certain cases, be useful, in so far as it teaches reformers and revolutionists the point beyond which nature forbids them to go; but its agents are almost invariably base in character, odious in their principles, and selfish in their projects. Religious reactions exhibit the same characteristics as political ones, and proceed from the same causes.

REACTION is the term employed in medicine and surgery to indicate the process of recovery from a state of collapse. The subjects collapse, reaction, and the general effects of shock upon the system are considered in the article on **SHOCK**.

READ, GEORGE, 1733-98; b. Md.; educated at Chester and New London; in 1733 was admitted to the bar, and began practice at Newcastle, Delaware. He held several local offices, and was a member of the continental congress 1774-77. In 1777 he became vice-pres. of Delaware, and later acting-president. He was the author of the first Delaware state constitution and a member of the convention that framed the U. S. constitution. In 1782 he was made judge of the court of appeals in admiralty cases; 1789-93 U. S. senator; and from 1793-98 chief justice of the Delaware supreme court.

READ, GEORGE CAMPBELL, d. 1862; b. Ireland; entered the U. S. navy as midshipman 1804, rising through successive grades to rear-admiral in 1862. He bore a record of bravery and courtesy. In the war of 1812, after the engagement between the *Constitution* and the British frigate *Guerriere*, he received the sword of capt. Dacres. In the autumn of 1812 he was in the action between the *United States* and the *Macedonian*. In 1862 he was appointed governor of the Philadelphia naval asylum, which position he held at his death. A narrative of his voyage around the world was published in 2 vols., 1840.

READ, JOHN MEREDITH, 1787-1874; b. Philadelphia; grandson of George, a signer of the declaration of independence; graduated at the university of Pennsylvania 1812, entered at the bar 1818, was district attorney, city solicitor, and member of the city council, and represented his district in the state legislature, 1823; re-elected 1824. In 1851, associated with Thaddeus Stevens, he defended C. Hanway in his trial for constructive treason. He was attorney-general of the state and judge-advocate of the court of inquiry on com. Elliot, judge of the supreme court of Pennsylvania 1860. He was author of many addresses, opinions, lectures, and newspaper articles.

READ, NATHAN, 1759-1849; b. Mass.; graduated at Harvard in 1781, and was tutor there 1783-87. He settled in Danvers in 1795, and began the manufacture of anchors, cables, etc. The next year he invented a machine for cutting and heading nails at one operation. He had, in 1791, attempted to utilize steam for navigation, and had propelled a boat by means of paddles moved by steam. He was a member of congress 1800-03, and in 1807 removed to Belfast, Maine, where he was for some years chief justice of the court of common pleas. He was the first person in this country to apply for a patent; at that time no patent law had been passed. Among his inventions were a method of equalizing the action of wind-mills, pumping-engines, and threshing machines, and tubular steam boilers.

READ, THOMAS BUCHANAN, 1822-72; b. Penn.; entered a sculptor's studio in Cincinnati, but afterward studied painting. In 1841 he settled in Boston, and began to paint portraits. In 1846 he returned to Philadelphia, and in 1850 went to Florence, where he spent most of the rest of his life. Among his works are *Lays and Ballads* (1848); *The House by the Sea* (1856); *The Wagoner of the Alleghanies* (1862); *A Summer Story* (1865); and *Poetical Works* (1866).

READE, CHARLES, D.C.L., one of the more distinguished novelists of the day, was born in 1814. He is the youngest son of the late John Reade, esq., of Ipsden House, Oxfordshire. He received his college education at Oxford, and so distinguished himself as to secure a fellowship. In 1843 he was called to the bar as a member of Lincoln's inn; but his legal studies may be presumed to have been merely nominal, and in no long time it became obvious that his chosen career was that of literature. The books by which he first became known as a writer of distinct mark and promise were his *Peg Woffington* and *Christie Johnstone*, both full of talent, though as yet somewhat crude and immature. In 1856 he fairly established his reputation in the novel in 3 vols., *Never too Late to Mend*, the first of a series of novels, each illustrating some social or public evil. Among his subsequent works are a tale in one volume, *The Course of True Love*, remarkable for a rare nicety and subtlety in the delineation of its leading female character; *White Lies* (3 vols. 1858); *The Cloister and the Hearth*; *Hard Cash* (1863); *Griffith Gaunt* (1866); *Put Yourself in His Place* (1870); *A Terrible Temptation* (1871); and *A Simpleton* (1873). He is besides the author of several dramas, which have had more or less success on the stage; the most general favorite, perhaps, being that entitled *Masks and Faces*. Mr. Reade is by common consent a writer of marked ability. He has much of the true talent of the *raconteur*, along with considerable dramatic instinct, and from all his later novels, a sense of general intellectual vigor is strongly borne in upon the reader; while a certain wayward crotcheticness and odd aggressive eccentricity from time to time cropping out, serve rather to give to his writing some relish and sting of individuality, than seriously to mar its effect.

READE, WILLIAM WINWOOD, 1839-75; b. Oxfordshire, England; nephew of Charles the novelist. He was noted as a traveler and African explorer. His first African journey was in 1832, and on his return he published an account of his tour called *Savage Africa*. In 1868 he started from Sierra Leone and traveled to the sources of the Niger, and in 1873 the London *Times* sent him as special correspondent with the Ashantee expedition. In 1875 he published *Story of the Ashantee Campaign*. Mr. Reade wrote several novels of no great merit, such as *Charlotte and Myra* (1859), and *The Outcast* (1875).

READING, a flourishing municipal and parliamentary borough of England, capital of Berkshire, stands on the left bank of the Kennet, $1\frac{1}{2}$ m. above the junction of that river with the Thames, and 36 m. w. of London by the Great Western railway. It is irregular in plan, though recently it has been improved in this respect. The tongue of land immediately above the confluence of the rivers is the chief business part of the town. The church of St. Lawrence, with a tall flint tower, still shows traces of its original Norman character; and the Benedictine abbey, now a mere shell, was founded in 1121, and was at one time the third in size and wealth in the country. Of the numerous educational establishments, the free grammar-school, to which are attached two fellowships at St. John's college, Oxford, and two scholarships, has an endowment of £50 per annum. Reading is an important mart for corn and other agricultural produce, carries on manufactures of silks, silk-ribbons, etc., and has extensive iron-works and a large biscuit factory. Pop. '71, 32,324.

READING, a city of Pennsylvania, on the left bank of the Schuylkill river, 58 m. n. w. from Philadelphia, pleasantly situated on an ascending plain, and supplied by a mountain behind it with streams of pure water. Reading has regular streets, public offices, several newspapers, blast-furnaces, rolling-mills, foundries, manufactories of steam-engines and machinery, cottons, woolens, nails; also flour and saw mills, with a large trade in coal by canal and railway. Pop. '70, 33,930.

READING (*ante*), a city in s. e. Pennsylvania, incorporated 1847. The original survey comprised 450 acres set off by Thomas and Richard Penn in 1748. It is on the Philadelphia and Reading railroad, at the junction of the East Pennsylvania, the Reading and Columbia, and the Berks and Lehigh railroads; also at the junction of the Schuylkill and Union canals; pop. '80, 43,280. The river is here crossed by three bridges. It is 55 m. n. e. of Harrisburg. On the e. is Penn's mount, containing extensive beds of iron ore, on the s. Neversink mountain. It contains two opera houses, a jail, an academy of music, several hotels, a public library, public schools (including high and normal), a Roman Catholic academy, and other private institutions of learning, and several charitable institutions, including a Roman Catholic hospital. The court-house is a fine building having an imposing front with columns of red sandstone. The municipal government is divided into 9 wards, governed by a mayor, a select council of 9, and a common council of 28. It has a well-organized fire department, an efficient police force, 3 national banks with an aggregate capital of \$700,000, a savings-bank with deposits amounting to \$100,000, and 4 fire-insurance companies. The principal buildings are erected with great regularity on streets crossing at right angles. Among the manufactories are shoe factories, breweries, tanneries, and the railroad repair shops; cigars, hats, bricks, lumber, paper, etc., are manufactured. It supports 11 newspapers, the larger number German, and is the center of a rich farming district, and active local trade.

READING AND SPEAKING. Reading is the delivery of language from writing; speaking is the utterance of spontaneous composition. Reading is merely mechanical when words are intelligibly but unimpressively delivered; and it is oratorical in effect when the sentiment proper to the utterance is expressed by pauses, tones, emphasis, etc. Recitation from memory is another form of reading, the matter being delivered from a mental transcript. This mode is highly favorable to oratorical effect, but it is limited in application, and untrustworthy where exactness of phraseology is important. Speaking from spontaneous composition is the highest form of oratory. The qualities requisite for these arts are very different.

To read well involves a perfect understanding of the construction of sentences, and ability to analyze complex forms of composition, and discriminate between essential and expletive words; it also involves a nice perception of the qualities of modulation, and their relation to expressiveness, together with ability to regulate the voice so as exactly to suit the sound to the sense. The study of the art of reading is thus valuable as a means of improvement in composition, as well as for its influence in refining the taste, and exercising all the faculties of perception, expression, and adaptation.

In good reading, the thoughts of the writer must first be taken into the reader's mind, and then delivered as the writer himself might have uttered them immediately on their conception. Children, when set to read language above their comprehension, are of necessity merely mechanical readers; and in this way they acquire habits of unintelligent reading, which are seldom perfectly thrown off in after-life. In silent reading, or the perusal of language for our own information, we gather the sense as we proceed, and correct misapprehensions by reflection; in reading aloud for the information of others, we must perfectly comprehend the matter before we utter it, so as to avoid misleading the hearer. A practiced reader can, no doubt, exercise sufficient prevision at the time of reading, by keeping his eye in advance of his utterance, to read any ordinary composition fairly at first sight; but for public reading this would be insufficient. Whatever is to be read in public should first be well studied in private. The reader thus knowing definitely what he has to express, will give forth no uncertain sounds, and his manner will have the freedom of memoriter delivery, without the disadvantage of its constraint upon the mind. His whole attention will be concentrated on the object of his reading, the effective conveyance of the matter and spirit of the composition. The presence of the book before him will be necessary chiefly to give confidence, and prevent the possi-

bility of rambling. The eye, assisted by memory, will take in clauses and even sentences at a glance, so that it may be freely raised during utterance. If the eye of a reader is fixed on the book, he seems to be perusing it for his own information; but if he look his hearers in the face, as, with due preparation, he should be able to do, his delivery may have all the qualities of spontaneous oratory, and be to the hearers speaking rather than reading. This effectiveness is rarely exemplified, because the requirements for public reading are so little understood, and so habitually neglected in our systems of education. The tameness, monotony, and rhythmical sing-song so generally associated with reading, have created a prejudice against the use of "paper" in pulpit addresses, in consequence of which, in some churches, the practice of reading sermons is discountenanced, while in others it is positively interdicted. The quality of sermons, as compositions, is seriously impaired under such circumstances; but the cure for bad reading—against which the prejudice is directed—is *good* reading. All men cannot be orators, but all may be taught to read oratorically; and were students systematically trained in this art, the services of the church would be rendered far more attractive and influential. In the absence of this training, preachers are the most ineffective of public speakers; and discourses prepared to be delivered from memory are among the meanest specimens of literary compositions.

The chief points of difference between ordinary reading and the utterance of spontaneous composition are the uniform force and time, and continuative tones of the former, as contrasted with the reflective breaks and varying modulations and emphases of the latter. The speaker feels what he wishes to say, and he conveys with definiteness the felt relation of each word to the idea which is dominant in his mind. Expletive and explanatory phrases are given parenthetically; ellipses, interpolations between grammatically related words, similes, quotations, and all other elements of rhetorical style, are indicated by changes of modulation; and the *point* of every sentence is made unmistakably apparent. The reader sees all the parts of a sentence level to his eye, and he is apt to deliver them with a corresponding indiscriminateness of manner; either without variety of time, tone, and stress, or with mere alternation of force and feebleness, or the equal indefiniteness of emphasis on every phrase.

The first requisite for effective reading is a clear conception of the author's intention, together with such a command of the voice as may enable the reader to express that one meaning to the exclusion of all other possible meanings. For every cluster of words is like a many-sided crystal, which may be made to throw light from any of its facets, according as one or another of them is presented uppermost. The most prominent word in the utterance of a sentence is not necessarily the most important grammatical word, but that which is new in reference to the context; and such words as are already before the mind—whether directly stated, inferentially included in former expressions, or otherwise implied—are pronounced with subordinateness of manner. Thus, in the following lines:

The quality of mercy is not strained,
It droppeth as the gentle rain from heaven
Upon the place beneath. It is twice blessed;
It blesseth him that gives and him that takes.

If the first line were read independently, it would be emphasized as follows

The quality of *mercy* | is not *strained*;

but if read in connection with the preceding context, the emphasis would be different. Thus:

Portia. Then must the Jew have mercy.
Shylock. On what compulsion must I? Tell me that.

"Mercy" and the "compulsion" of mercy being thus already before the mind, the chief point in Portia's reply will now be:

The quality of mercy *is* not strained,
It droppeth, etc.

But, as to "drop" is the natural characteristic of "rain," and as rain always falls "from heaven," and necessarily upon the "place beneath," these implied words will be pronounced subordinately; thus:

It droppeth as the *gentle rain* from heaven
Upon the place beneath.

Bearing in mind, further, that mercy is of necessity "blessed," the reader will proceed:

It is *twice* blessed;

and as the object of the speech is to *solicit* mercy, he will give prominence to the word that advances the suit. Thus:

It blesseth him that *gives*, and him that takes.

On this principle, the reader shows that he has, in his own mind, performed the writer's process of thought, and so made the language which he interprets virtually his own. But in order to express with definiteness the thoughts and sentiments thus adopted, the reader must have the *instrument* of expressiveness perfectly under control. His voice should have no more predisposition to any particular tune than the flute or violin of a

musician. Tones have an inherent value, which is above and independent of language, so that assertive construction may be made to convey interrogative meaning, and interrogative language may have assertive or imperative force. The modulations of the voice unravel all the complexities of composition, separating words from their immediate context, or connecting them with others from which they are most widely separated in the sentence. Thus, in the following lines:

Slowly and sadly we laid him down,
From the field of his fame fresh and gory,

the clause "fresh and gory" is, by relative modulation, shown to refer to "him" in the preceding line, and not to the nearer words "fame" or "field." So, also, in the following passage: "And they came with haste, and found Joseph and Mary, and the babe lying in a manger." Here the series "Joseph and Mary | and the babe" is divided by a modulation of the voice, so as to show that the last word "babe" is alone the grammatical antecedent to the clause "lying in a manger." From such illustrations it will be obvious that good reading involves close thinking, and that the governing qualities of tone demand accurate appreciation and careful culture.

The tones of the speaking voice are all more or less *inflected*, in which respect they differ essentially from singing tones, which are level, and only varied in pitch. The term "modulation," as understood by elocutionists, has reference to the general pitch of the vocal inflections in a passage. The inflections themselves are all either rising or falling. The rising turn of voice carries on the hearer's attention to what is to follow—the falling turn directs attention to what has gone before; the former asks, or appeals to the hearer—the latter affirms or enjoins from the speaker; the former is negative—the latter is positive. Simple inflections rise or fall directly from their accentual pitch to their termination, and the range of the inflection may have any extent, from less than a semitone to more than an octave. The strongest rising tones are expressive of interrogation, incredulity, or entreaty, and the strongest falling tones of affirmation, assurance, or command. Compound inflections unite the two vocal movements—falling before a rising termination, and rising before a falling termination—with one accentual impulse; and the effect of this opposition of tone is to add to the expressiveness of the termination a suggestion or *inférence* in accordance with the expressiveness of the commencing turn. Thus: "Not *one*," with compound rising tone, implies "but more." "Even *one*," with compound falling tone, implies "and not more."

The emphatic force of tones depends on their accentual pitch in relation to that of preceding tones, as well as on the extent and the direction of the inflection. The amount of possible variety in these degrees is exceedingly great, but the peculiar expressiveness of individual modes of inflection is definite, traceable to systematic principles, and of limited extent, depending principally on three qualities—

1. Rising or falling accent as well as termination; as
Cónstánt, Cónstánt.
2. Rising or falling accent with opposite termination; as
Cónstánt, Cónstánt.
3. Accent higher or lower than preceding pitch; as
díc? To sléep. To sléep? Perchance to dréam.

These three sources of vocal variety the student of elocution should have under ready and perfect control.

The art of elocution has received comparatively little attention in modern times. The value of a good delivery is certainly not less now than it was among the orators of ancient Greece and Rome; but the assiduity with which the art was cultivated by the latter, and the estimation in which it was held by them, present a strong contrast to the negligence and apathy of modern speakers in regard to delivery. This fact is not easily accounted for; the influence of elocution being such, that an inferior address well delivered never fails to create a stronger impression on an audience, than the most masterly composition that lacks the graces and enforcements of effective utterance and action.

The model for effective reading is to be found in the ordinary style of animated conversation. The speaker's tones are not governed by the laws of punctuation, or by formal grammatical periods. Every clause in a sentence is, to the speaker, a period. The most complex sentence is only an aggregation of correlative sentences, each of which is a separate act of thought, and should be delivered as such in reading, as it always is in speaking. Modulation will show the relation of each part to the whole, but inflection should at the same time show each part to be in itself complete, as the statement of a distinct though subordinate fact or circumstance.

The rules which some elocutionists have laid down for the reading of sentences, are clearly at variance with this natural principle of intonation, and they lead to an artificiality of manner which is at best a pedantic tune. The formal arrangements of inflections which have been gravely prescribed for "simple" and "compound," "commencing" and "concluding" series, "penultimate" and "ante-penultimate" clauses, etc., have done much to discourage students from paying proper attention to the art of elocu-

tion, and have almost justified the denunciations of some authors, who have declared elocution to be altogether unworthy of study. Thus, archbishop Whately, in his disgust at the jerking alternations of ups and downs prescribed in elocutionary rules, counsels students to have nothing to do with rules, but simply to be "natural." To be natural, however, is to follow those laws or principles which undoubtedly are to be deduced from the operations of the voice in spontaneous speaking; and these must be studied by all who would be "natural" in practising the art of reading. In elocution, as in painting and in every art, the highest attainment of the finished artist is to be natural. Nature and art are not opposites; the former is the *end* of the latter; the latter the *means* to the former. To be natural does not "come by nature," but by art; and "art itself is nature." Elocution, therefore, is none the less "natural," that it must be studied as an art; and the study of this art is not justly to be contemned, whatever condemnation may be due to the errors of elocutionists.

To acquire a natural style of reading, the chief point to be attended to is the logical clausuring of sentences, so as to present, with separate completeness to the hearer's mind, every fact and every associated circumstance, whether principal or subordinate. Punctuation is not a sufficient guide for this purpose; it will sometimes even mislead. Thus, in the following sentence from Macaulay's *Essay on Milton*: "Even when a system has been formed, there is still something to add, to alter, or to reject"—the logic of the sentence is not brought out by the punctuation. The reader should make a modulative break after the word "something," where no comma is placed, and he should, notwithstanding the separating commas, unite the three subsequent clauses by a modulative tie, to show their expletive nature, and the equal relation of each of them to their common antecedent. Thus: "There is still *something* | to add, to alter, or to reject."

In the following sentence from the same essay, no comma occurs, but the reader will nevertheless divide the period into at least three modulative clauses: "The blaze of truth and liberty | may at first dazzle and bewilder | nations which have become half blind in the house of bondage." Here the first section contains the *subject* of the sentence, the second the *predicate*, and the third the *object*, with its dependent clauses. It is to be observed that the object "nations" is separated from its governing verb "bewilder," only because the former is itself the governing antecedent to a new but subordinate sentence.

These illustrations are sufficient to show that the clausuring of sentences for effective reading is dependent on a different principle from that which regulates punctuation.

Nor is any particular mode of vocal inflection necessarily associated with any of the marks of punctuation. This is particularly to be noted in connection with the sign of interrogation. The position of this mark, too, at the end of a period often misleads readers into an unnatural tone. The interrogative part of the sentence may not extend beyond a single clause, and this may be followed by many clauses within the same period. The mark of interrogation would therefore be better placed at the beginning of a sentence. But, as above shown, interrogative language may sometimes require for its just expression any one of all the tones in the gamut of speech. Thus: "Will you?" If pronounced with a simple rising tone, this question asks or appeals; and with an extended range of inflection, it expresses doubt or surprise. But the form of words does not necessitate the rising tone. Thus: "Will you?" If pronounced with a simple falling turn, the question expresses desire or expectation on the part of the speaker; and with an extended range of inflection, it conveys more or less of authoritative injunction.

The same question may legitimately, also, take either of the compound forms of inflection. Thus: "Will you?" If pronounced with a compound rising turn, it infers some cause of opposition or hindrance; and with an extended range of inflection, insinuates more or less of threatening or penalty. With a compound falling tone, thus: "Will you?" it suggests more or less of defiance and contempt, according to the pitch of the commencing turn, and the extent of the concluding inflection.

The principles of vocal expression, clausular pronunciation, emphasis, etc., as above sketched, apply equally to speaking as to reading; but it is in connection with the latter chiefly that they require to be studied, as they are generally applied instinctively in spontaneous speaking, even by those who are most enslaved by vicious habits in reading. The management of the voice, however, should be more than an instinct to the orator; and there is much in the philosophy of vocal expression that will be studied with equal advantage by both speakers and readers.

Extemporaneous speaking is greatly assisted by a good habit of elocution, and it is at the same time strongly conducive to the formation of such a habit. The deliberate utterance which weighs every phrase, gives the mind time to revolve its ideas, and choose the most effective words for their expression; and the evolution of a continuous train of thinking in coherent sentences compels deliberation and guarded delivery. But while the grandest triumphs of oratory are thus to be achieved, the requisites for success are such that great orators must ever be few in number. The ancient rhetoricians describe their model speaker as one who is accomplished in all knowledge, and esteemed for every virtue, and who has devoted more than the average duration of human life to laborious preparation; for they held that the oratorical faculty could not attain its full development and influence until hoary hairs had added the venerableness of age to a reputation for learning, sagacity, and unimpeachable morality.

Speaking from memory admits of the application of every possible element of effectiveness, rhetorical and elocutionary; and in the delivery of a few great actors, the highest excellence in this art has been exemplified. But speaking from memory requires the most minute and careful study, as well as high elocutionary ability, to guard the speaker against a merely mechanical fluency and thoughtlessly rhythmical utterance. This mode of delivery is therefore only appropriate to special efforts, for which due preparation can be made. Otherwise, memoriter delivery—as of sermons composed and learned at the rate of one or two every week—is altogether incompatible with excellence either of matter or of manner.

That the art of reading, which is on all accounts worthy of the highest position among the exercises of students for the oratorical professions, should be so utterly neglected in our systems of education, is a reproach to the enlightenment of our age; and it is especially a scandal to our universities, in which the examples of the famous orators of antiquity, and the lessons of their experience, are so fully known, yet practically dishonored.

REAL is a phrase much used in the law of the United Kingdom in combination with various other terms. In the law of England and Ireland real property or real estate, or realty, constitutes one of the great subdivisions of all property, consisting of what is popularly known as land and houses, which are not legal terms; personal property, or personalty, includes all the other kinds of property, as goods and chattels, money, etc. The same or a similar distinction pervades the laws of all countries. In the Roman law things were divided into movable and immovable. In the law of Scotland the division is into heritable and movable. The division into realty and personalty comes into operation in the event of the death of an owner of property, especially when he dies intestate, in which case his realty goes to the heir-at-law, and the personalty to his administrators or executors. See **SUCCESSION**. A division also exists in England of actions into real and personal actions, the object of the former being to recover real property, and of the latter to recover damages, or the possession of personal property; while there is also a class of actions called mixed actions, which partake of the nature of both. With regard to chattels there is also a subdivision into real chattels and personal chattels, the former consisting of contracts and interests affecting real estate, such as leases and mortgages, while personal chattels include corporeal movables. Then there is a division of assets into real assets and personal assets, the former being the real estate, so far as it can be made according to the rules of law liable for the debts of the deceased. In Scotland the word is also frequently used technically, though not in the same sense as in England. Thus, real actions in Scotland mean actions the object of which is to recover possession of the property itself, whether heritable or movable, and a real right is a right to the property itself in a like sense. A real burden, in the law of Scotland, means the right to a sum of money, or other obligation, so secured on land that the land cannot be sold or alienated except as subject to the burden, and until the burden is discharged.

REAL', a silver coin and money of account in Spain, Mexico, and other old Spanish possessions. It is the $\frac{2}{5}$ part of the piaster (*peso duro*), or $\frac{1}{2}$ of the *peseta*, the franc of the new Spanish decimal system, and has a value, varying with the exchange, of about 2½d. Of the old Spanish reals now disused, the *real de plata* was the $\frac{1}{4}$ of the piaster or *peso duro* (see **PIASTER**); and the copper-real or *real de vellon*, was the $\frac{2}{5}$ part of the piaster. The real was first coined in Spain in 1497, and has since that time frequently varied in value. At the present day, in Mexico, Peru, and the Central American republics, the piaster is divided into eight reals, and silver coins of one real are current, while in Colombia it is divided into 10 reals, and silver reals and half-reals are coined. The real is also a money of account in Portugal, being the equivalent of 40 reis; and in Batavia it is the name of a weight for gold and silver articles corresponding to 17 dwts. 14 grains troy weight.

REAL'GAR, a mineral consisting of about 70 parts of arsenic and 30 of sulphur. This native sulphuret of arsenic is of a very brilliant scarlet color, generally translucent, but sometimes transparent; and occurs in the vicinity of volcanoes, and in many igneous rocks; massive, disseminated, or crystallized. Its crystals are prisms, sometimes needle-like. It yields to the pressure of the nail.

RE'ALISM. See **NOMINALISM**.

REAL PRESENCE, in the Eucharist, a doctrine forming an article in the belief of the Roman, the Greek, and other eastern churches, and of some bodies or individuals in other Christian communions, according to which it is held that, under the appearance of the Eucharistic bread and wine, after consecration by the priest, Christ himself is really and substantially present, body and blood, soul and divinity. The word *really* is used in opposition to "figuratively;" and the decree of the council of Trent, which is the authoritative expositor of the Roman Catholic belief, conjoins with that word the terms "truly" and "substantially," the former being used in order to exclude the notion of a barely typical representation, such as is recognizable in the paschal lamb and the other Messianic types of the old law; and the latter for the purpose of meeting the view ascribed to Calvin, that Christ, as apprehended by the faith of the believer, was for such believer rendered virtually present in the Eucharist, and that his body and blood

were received in virtue and efficacy, although not in corporeal substance. The belief of the Roman and eastern churches as to the reality of the presence, was shared by Luther, who, however, differed from Catholics as to the mode; and has always been followed also by one school of divines in the Anglican church, whose doctrine became very prominent in the time of Laud, and has been revived in the late Tractarian movement. But between Catholics and all the non-Catholic schools of whatever class, one marked difference exists. According to the former, the presence of Christ in the consecrated Eucharist is *permanent*; so that he is believed to be present not alone for the communicant who receives the Eucharist during the time of his communion, but also remains present in the consecrated hosts reserved after communion. On the contrary, all the Lutherans, and almost all Anglicans, confine their belief of the presence to the time of communion, and all, with hardly an exception, repudiate the worship of the reserved elements, as it is practiced by Catholics.

The question as to the *reality* of Christ's presence in the Eucharist is quite distinct from that which regards the *mode* of the presence, for which see TRANSUBSTANTIATION.

REAM, a certain quantity of paper, consisting of 20 quires, each quire containing 24 folio sheets. A *printer's ream* should consist of 21½ quires. The word appears to be derived from the Saxon *ream*, a band, and was probably applied in consequence of the bundle of paper being held together by a band.

REAPING, the act of cutting corn, has been performed from time immemorial with an instrument called a reaping-hook or sickle. The sickles in use among the ancient Jews, Egyptians, and Chinese appear to have differed very little in form from those employed in Great Britain. The reaping-hook is a curved instrument of about 1½ ft. in length, tapering from a breadth of about 2 in. at the butt-end, where it is fixed into a wooden handle. The edge is sometimes serrated, but, as a rule, it has long been made plain and sharp like a knife. In reaping, the harvester takes the corn in his left hand, and then with the hook cuts the stalks as close to the ground as possible; but when a grass crop has been sown down with the grain, the stubble is often left rather longer, in order to preserve the young grass. The corn is placed handful by handful in a band usually made of the corn, and when as much has been cut as will form a sheaf, it is tied up by the "bandster." The most expert reapers slash down the corn with the hook in the right hand, using the left merely to keep the corn from falling, until sufficient to make a sheaf has been cut, when the reaper places his hook under the corn, and supporting it with his left arm, deposits it all at once in the band. A bandster (one to every three or four reapers) binds the grain, and sets it up in stooks of generally 12 sheaves. It was surprising to see women of 60 years and upward handling the "hook" with great dexterity, accomplishing their 20 and sometimes 24 stooks of 12 sheaves each per day. After such a day's work, these women appeared much fatigued, but a night's rest seemed to set them on foot, vigorous as ever. They divested themselves of much of their clothing, and really worked hard for their money.

In the principal corn-growing districts of Scotland a great proportion of the reaping by hand was at one time done by laborers from Ireland, who undertook the work at from 8s. to 15s. per acre, with board and lodging in addition. Their fare was of the simplest kind—consisting, in the majority of cases, of porridge morning and evening, and bread and beer for dinner; their lodging at night was the barn or some outhouse, the farmer providing coarse blankets for covering. The quantity of porridge consumed at each meal by those people was sometimes astonishing—no less, as has been proved by actual weighing, than 5 lbs., with 1½ lbs. of milk besides. In England, most of the corn was cut by piece-work, at prices varying from 10s. to 18s. per acre. On the stronger lands of the midland and southern counties, the stubble is sometimes left knee-high, and afterward at leisure cut by the scythe, or with a long hook, at a cost of 2s. per acre. In Yorkshire, Derbyshire, Oxfordshire, and on many of the lighter soils in other counties, the operation of fagging or hacking, to be afterward noticed, was preferred as being more expeditious than reaping. A good hand cut down from one-third to one-half of an acre of wheat, and often consumed, during his long day's labor, two gallons of good ale.

The scythe, in some counties, more than thirty years ago, was preferred to the sickle. The most common varieties were the Hainault scythe—an importation from Belgium—the cradle scythe, and the common scythe fitted with a cradle. The Hainault scythe consists of a blade about 2 ft. 3 in. long, having a handle 14 in. long. This the mower holds in his right hand, while in his left he carries a hook, with a handle of about equal length. "The reaping," says the late Mr. Henry Stephens, in his *Book of the Farm*, "is done by pressing the back of the hook with the left hand against the standing corn, in the direction of the wind, and by cutting with the scythe close to the ground against the standing corn with a free swing of the right arm," the hook keeping the cut corn from falling until a sufficient quantity to form a sheaf has been cut. This operation was practiced in many parts of England, and especially on the lighter soils, under the name of fagging or hacking, the reaper sometimes using in his left hand, instead of the hook, a stout crooked stick from 2½ to 3 ft. long. Beans and oats were the crops most generally fagged. The cradle scythe is composed of a blade about 3½ ft. long, attached to a principal helve or sned about 4 ft. long, into which another helve of about 2½ ft.

in length is tenoned, thus making two handles. The cradle or bow is a piece of wood jointed to the heel of the blade, into which are inserted three or four wooden teeth, in a line with the blade, the object of which is to secure the grain being laid evenly in one direction. As skill at the working of the scythe, however, increased, the cradle or bow was discarded in many cases. By the scythe, corn can be cut at a rather less cost per acre than with the hook; but the work is not so neatly done. As nice a stubble will be left by a good hand with the scythe, and often nicer than by the hook, but the sheaves are not, as a rule, so tidy after the scythe, though they will stack rather earlier. Of a fair working crop, an adept at the scythe would cut 2 or 2½ acres per diem. The average area cut per day with the scythe does not exceed 1½ acres. In fact, if the crop is heavy, that extent is a very hard day's work. Those who contract for cutting the crops by the scythe obtain the services of the best men, and thus generally get about 2 acres per day reaped, and reaped very well too. In the midland and southern counties of England, the scythe, long in general use, was of larger size, and had only one long shaft, on which were fixed two handles. In Bedfordshire, Hertfordshire, and some of the eastern counties, the whole of the cutting, until the introduction of reaping-machines, was done by these scythes. The harvest operations then, from the cutting of the crop to the thatching of the ricks, cost from 18s. to 25s. per acre.

The process of reaping with either the sickle or the scythe is, however, both tedious and expensive; and hence, during the last three-quarters of a century, many attempts have been made to accomplish the work by machinery—attempts which, in the course of the last 20 years, have been crowned with complete success. Reaping by machinery, however, is no modern invention. Pliny the elder, who was born early in the 1st c. of the Christian era, found a reaping-machine in Gaul. He says: "In the extensive fields in the lowlands of Gaul, vans of large size, with projecting teeth on the edge, are driven on two wheels through the standing corn by an ox yoked in a reverse position. In this manner the ears are torn off, and fall into the van." Palladius, about four centuries later, found a similar appliance for reaping corn in Gaul. He gives a more detailed but similar description of the machine.

In modern times the idea of a mechanical reaper appears to have originated with a Mr. Capel Lloft, who, in 1785, suggested a machine something after the pattern of the ancient one above described. Between that time and the great exhibition of 1851, in London, from which the general use of mechanical reapers may be said to date, the patents taken out for reaping-machines were very numerous. Among the most promising of these may be mentioned those of Mr. Gladstone of Castle-Douglas; Mr. Smith of Deanston; Mr. Kerr, Edinburgh; Mr. Scott of Ormiston; Mr. Dobbs, an actor in Birmingham; Mr. Mann of Raby, near Wigton; and the late rev. Patrick Bell of Carmylie, Scotland. In 1826 Mr. Bell constructed an efficient and simple machine, which long continued in use, and several features of which are observable in the reapers of the present day. The inventor of this, the first machine of the kind in Scotland, received a public testimonial from agriculturists, in consideration of the services he thus rendered to agriculture. In America Mr. Hussey and Mr. McCormick took out patents for reaping-machines of superior character in 1833 and 1834 respectively.

The movements of the cutters of these machines were various. A few were advancing only, some sidelong and advancing, others reciprocating and advancing, a large number continuous and advancing, and others continuous and alternate. The reciprocating and advancing motion is that now employed on the machines in use. The principal difference in the machines now so largely used for cutting corn is in the form and character of the cutters, and in the mode of delivering the grain after it is cut.

The cutting-knives are of two kinds—one, obtuse-angled and serrated; the other, acute-angled and for the most part plain. Both are attached to a bar, and are made to work through another bar of iron fitted with hollow fingers, called guard-fingers, which, projecting forward, catch the standing corn, and retain it firmly until it is cut. The serrated knife saws through it; the plain knife clips it, as it were; the finger-guard forming the fixed blade of the scissors.

The delivery of the sheaves is effected either by manual or mechanical labor; but the vast proportion of the machines in use are what are termed manual delivery-reapers. The delivery of the sheaves by manual labor is now almost at the back of the machine, the side delivery being generally abandoned, unless in the self-deliveries. In delivering the grain a man with a short-handled rake in his hand sits upon the machine almost opposite the cutting apparatus. With this he inclines the grain toward the knife; and when sufficient to make a sheaf has been cut, he rakes it off the platform upon the machine, on to which it has fallen, and deposits it on the ground. In making a neat and squarely-formed sheaf, the raker is greatly assisted by a hinge in the platform, which enables him, by pressure of the foot, to tip the board over, so as to let the corn slide gently down. With the back-delivery the sheaves must be tied up and removed out of the way of the machine before it comes round again. Such a reaper, therefore, always requires a full supply of hands to attend upon it. But it is the best for all that. It does require a skillful, careful man to "till," but the fact that the course has to be kept clear for the horses every round spurs the laborers, who thus do more work than they would otherwise accomplish. Besides, it is a very doubtful advantage to be enabled to slash down the crops irrespective of the gathering capacities. Moreover, with the self-

delivers it is the distance gone over, and not the quantity of crops collected, that regulates the size of the sheaf. With uneven crops this is an inconvenience. Sheaves of different sizes are very troublesome in the stook. They will not stand well, and in stacking it is difficult to keep uniformity in building. Large and small-sized sheaves are not equally dried, and are not ready for stacking at the same time. Eight people "lifting" after the manual-reaper will do as much work as nine following the self-delivery, so that the saving of a man's labor claimed by the self-delivery is doubtful. The sheaves are rather better formed by the manual machine than by the self-delivery. Each kind has, however, and will likely continue to have its advocates, though the preponderance is in favor of the manual.

The mechanical or self-delivery machines, as they are generally called, are of two kinds—one lays the cut corn in swaths, the other deposits it in sheaves. The latter is decidedly the best and most fashionable of the two.

The automaton sheaf-deliverers best known to the public are those of Samuelson of Banbury; Hornsby & Son; Burgess & Key; Brigham & Bickerton, Berwick; Howard & Co., Bedford. We give a description of Samuelson's sheaf-deliverer (largely used in Great Britain). The self-delivering machinery consists of a series of four rakes—two toothed, and two plain—attached to an upright shaft, in such a manner as to admit of a free ascending, descending, and horizontal motion. The two toothless rakes, or "dummies," are shorter in the arms by 6 in. than the other two, and are merely employed to incline the grain toward the cutter. The platform upon which the grain falls after it is cut is of quadrant shape, and is surrounded, on the outer edge, by a rim of about a foot deep. The side of the *cam* next the platform is bent or depressed, so that the rakes on reaching this point, make a sudden fall, or eccentric motion, thus assuming the horizontal attitude necessary to sweep over the platform on the level. The rakes are adjusted so as to lay the sheaves about 12 ft. apart, to the side, and out of the way of the horses. This machine has a double-throw knife—an arrangement which reduces the driving speed, and consequently the wear and tear of the machinery.

In McCormick's automatic delivery-machine, a rake is so used that "during one part of the revolution of the gathering-reel it acts as one of the vanes of the reel in bending the standing corn to the cutting-blades. When the rake reaches the cutting-blades in front of the platform, it ceases to revolve around the reel-shaft (which continues its rotary motion), and is made to move horizontally upon a vertical hinge, to which one end is attached (the points of the teeth being near the surface of the platform), sweeping the cut corn off at the side, and depositing it on the ground in sheaves ready for the binder." The Messrs. Brigham & Bickerton's improved machine has a deep upright board of sheet-iron to keep the corn on the platform. Iron rods on these sheets separate the corn. This firm has thrown off two branches lately. The first off-shoot was Messrs. Lillie & Elder, and the last was Bickerton & Co. The three firms make good serviceable reapers. Howard's and Hornsby's reapers are substantially and simply constructed, embracing slight improvements every other year, formed on experience. Prices range from £20 to £35.

The makers of manual delivery-machines are numerous, including in a prominent degree Kemp, Murray & Nicholson, Stirling; Jack & Sons, Maybole; Harrison, Macgregor & Co.; Picketsley, Sims & Co.; Ransome, Sims & Head, Ipswich; Samuelson & Co., Banbury; J. & F. Howard, Bedford; and many others of fame. The manual delivery-machines of the first-named firm are very popular, strong, and ingeniously manufactured, while those of the Maybole firm are not quite so strong, but work with great ease and tastefulness. Carefully handled, the manual delivery-reaper will take up laid and twisted crops admirably. Indeed, all the reapers nowadays, perfected as they are year by year, now do their work remarkably well, leaving a beautiful stubble and a nice sheaf. The sheaves from the reaper, however, are not so easily dried for the stackyard as those from the scythe, but they defend rain better, and are altogether preferable. The number of reapers now in use in Great Britain is enormous, and is growing rapidly every year. They are a most decided improvement. Indeed, they are one of the most valuable introductions that have been made in rural agriculture in this country. At almost every farm of ordinary or even comparatively small dimensions, there is a reaper, and three or four engaged on the larger holdings. The cost of the manual delivery ranges from £18 to £30.

The cost of reaping by machinery is much less than either by scythe or sickle. Mr. Wilson of Woodhorn, Morpeth, found that the cutting of wheat with the sickle (binding and stocking included) cost him from 11s. to 15s. per acre, and with the scythe 8s., while with the machine it only cost him 5s. 9d., exclusive of wear and tear. From data supplied by a large number of their customers, Messrs. Samuelson & Co. make out that the saving by mechanical over hand labor is, as compared with reaping, 4s. per acre, and with mowing, 1s. 9d. per acre; and most farmers who have tried reaping-machines set down the saving at from 20 to 30 per cent. Besides, there is about a like economy in time, which is of immense importance in a variable climate like that of Great Britain.—See Woodcroft's *Appendix to Patents for Reaping-machines*; Mr. Jacob Wilson's "Essays on Reaping-machines," in *Transactions of Highland Society* for January, 1864; *Book of Farm Implements*, and *Book of the Farm*, by Henry Stephens; J. C. Morton's *Cyclopædia of Agriculture*.

REAPING (*ante*). Pliny the elder, A.D. 33, describes in Gaul a cart fitted with stationary combs, tearing off the grain and abandoning the straw; and Palladius describes the same, 391, unchanged in three centuries, but in its reversely yoked cattle and elevated platform foreshadowing the modern header.

The modern reaper, originating with Mr. Capel Lloft in 1785, suggesting a machine little in advance probably of the ancient "comb," received its first legal recognition in 1799, in England. Various inventors followed; and in 1826 the rev. Patrick Bell, in Scotland, built, and during 1828 and 1829 worked successfully, a simple machine, pushed by horses, and cutting by a series of scissors, and moving the grain into swathes continuous around the field, by an inclined sidewise-moving apron. Used from 1828 to 1832 in Scotland, a single specimen was imported and tried by John B. Yates, at Chittenango, N. Y., in 1835. Its main feature, the sidewise-moving apron, is used in a modified form to-day. Before 1832 only eight U. S. patents were granted; and previous to Bell, Hussey, and McCormick, all were merely experimental.

Obed Hussey in 1833 invented the reciprocating angular wave-edged knife, serrated now for reaping, smooth for mowing, and moving as one blade of a pair of scissors in as many stationary blades—double fingered, embracing the sickle above and below—as there were projections or serrations in the sickle. His reaper was tried in Hamilton county, Ohio, in 1833, and patented in the same year. Following him, in 1834, C. M. McCormick, formerly of Virginia, now of Chicago, patented a reaper; farther improved by him in 1845 and 1847, and in all adopted Hussey's knife; but since the Hussey reaper, carrying a platform and support for the raker, raked directly rearward, the improvement of Seymour of Brockport, and Palmer and Williams in 1851, changed the platform to a quadrant shape, and employed a vibrating rake, from the center of the platform circle. After this Bell's machine again appeared in competition, in England, with Hussey's and McCormick's, in 1853. Following these, Dorsey of Maryland in 1856 added to the rake over the quadrant platform three additional arms, and made its motion continuous; and following him, Samuel Johnston of Brockport, N. Y., placed rake teeth on each arm of the Dorsey rake, and a double cam guide-way to the pivot head. Thus the reel was abandoned, only continuing to be used with some special machines; but from the invention, in 1858, of the C. W. and W. W. Marsh harvester—a simple addition of an elevating device and raised table for reception of grain—the use of the reel revived. Many varieties—notably the McCormick, Elward, and Adams and French (vibrating slats to shift the grain step by step as an apron and elevator)—have all had as an object the carrying of manual or mechanical binders; the latter using wire and cord, and freeing the former human binder for other labor. The wire binders have been proved injurious in leaving wires to go through threshing. The string binder, largely experimental, is destined to receive great favor; and every firm building grain-harvesting machinery projects one. In mowers, simply cutting, the Wheeler type, invented 1854; the Buckeye, of the same year, invented by Aultman and Miller; and the Ball type, all aim at flexibility. Keichum and Kirby originated the one-wheel class of machine.

REASON—REASONING. The word reason denotes that function of our intelligence having reference to the attainment of a particular class of truths. We know a great many things by immediate or actual experience. Our senses tell us that we are thirsty, that we hear a sound, that we are affected by light. These facts are truths of sense, or of immediate knowledge, and do not involve the reason. Reason comes into play when we know a thing not immediately, but by some indirect process; as when, from seeing a river unusually swollen, we believe that there have been heavy rains at its sources. Here the mere sense tells us only that the river is high; it is by certain transitions of thought, or by the employment of our thinking powers, that we come to know the other circumstance, that in a remote part of the country there have been heavy rains.

In ascertaining these truths of reason, or of inference, as they are called, there are various steps or operations, described under different names. Thus we have (1) **DEDUCTION**, or **SYLLOGISM**; (2) **INDUCTION**; and (3) **GENERALIZATION** of notions, of which **ABSTRACTION** and **DEFINITION** are various phases. These are described under their several designations. The nature of the function or faculty denominated reason or the reasoning faculty can be explained by showing how it results from the fundamental powers of the intelligence. See **ASSOCIATION OF IDEAS**.

There is another and peculiar signification attached to the word reason, growing out of the philosophy of Kant. He maintained the existence of certain principles or cognitions *à priori*, or of intuitive origin, and not derived from experience, such as cause and effect, the axioms of mathematics, etc. See **COMMON SENSE**. It was a function of the reason, according to him, to recognize those principles; while the generalizations of mere experience, as that water extinguishes fire, were proved by the understanding. Other philosophers give the name "noetic faculty" (Greek, *nous*) to the same function. Hamilton calls it the "regulative faculty."

REAU-MUR, RENÉ ANTOINE FERCHAULT DE, a celebrated naturalist and physicist, was born at La Rochelle, in the department of Charente-Inférieure, France, Feb. 28, 1683; and studied in the Jesuits' college at Poitiers, and afterward at Bourges. With an eye observant of facts of every kind, and an indiscriminate thirst for information, he yet

specially devoted his attention to physics, natural history, and mathematics. In 1703 he went to reside at Paris, where he speedily attracted general attention by the publication of three geometrical memoirs on particular cases of the intersection of lines; and in 1708 he was elected a member of the academy of sciences, and was charged with the supervision of the work *Description des divers Arts et Métiers*, published under the auspices of the government. Réaumur lightened his labors with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, gold-bearing rivers, and turquois mines of France. His investigations into the nature of the turquois of Languedoc led him to the discovery, that they consisted of the fossil teeth of extinct animals. The collections of memoirs of the academy of sciences from 1722 till 1725 contain a number of papers by Réaumur, in which he details his discoveries of the mode of producing steel from iron (an art till that time unknown in France), of the tendency which fused metals have to become crystallized, and of the mode of tinning iron (also till that time unknown in France). For these brilliant and valuable successes, he received from the French government a sum of 12,000 livres, which he spent in promoting and encouraging the industrial arts in his native country. Réaumur's volatile genius next prompted him to take up the subject of pottery; and here also his ingenuity and perseverance were rewarded with success, for though he failed in successfully imitating the porcelain of China, he succeeded in producing (1739) an opaque glass, which was equal to the porcelain of Saxony and Japan. All this time he occasionally pursued his studies in natural history, at one time propounding a mode for preserving eggs (by coating them with fat), at another giving directions for the production of fowls by artificial incubation. His invention of the *thermometer* (q.v.) which bears his name need not be more than mentioned here. He died of a fall from a horse at his estate of Bermondière, in the department of Maine, Oct. 17, 1757, leaving behind him a voluminous collection of works on all the subjects above stated, also a treatise on "the silk of spiders," which was translated into Mauchu by the command of the emperor of China; and a number of memoirs (1731-40), containing his thermometric researches on air, and on mixtures of fluids with fluids or solids. But by far his most important work is the *Mémoires pour servir à l'histoire des Insectes* (Amsterdam, 12 vols. 1737-48), which embodies a number of original observations and discoveries concerning the habits and instincts of insects, sufficient of itself to immortalize their author. Only six volumes of this work have been published, the seventh being very incomplete at the period of the author's death. While collecting materials for this great work, he kept numerous insects of all kinds in his garden, in order to have every opportunity for observing them. The academy of sciences obtained, by the terms of Réaumur's will, his collections of minerals and plants; materials for a history of quadrupeds and birds, afterward made use of by Brisson and Buffon; a history of arts, in MS.; and an immense number of finished and unfinished MS. memoirs.

REBATE, a longitudinal groove, cut in a piece of timber, to receive the edge of another piece, or the ends of a number of pieces of wood. A notch, such as that in a door standard for the door, is also called a rebate. In masonry, such a joint is called a joggle.

REBÁT'ED, in heraldry, having the points broken off or cut short.

RE'BEÇ (anciently *rubèbe*, or *rebelle*, Arabic, *rebab*), an ancient musical instrument of the violin kind, of which the body, instead of consisting of two hemispherical enlargements, like other instruments of the same tribe, was narrow toward the neck, and gradually enlarged till it rounded off at the lower end. It had a bridge and three string-tuned in fifths, and was played with a bow. The earliest known representation of the rebec, however, taken by the abbé Gerbert from a MS. of the 9th c., gives it but one string. The Moors introduced this instrument from the east into Spain, whence it spread over the rest of Europe, and was the precursor of the violin. The four classes of rebecs, treble, alto, tenor, and bass, were favorite instruments of the minstrels of the middle ages, and were used both for the dance and to accompany street-singing. Milton, in his *L'Allegro*, characterizes this instrument as the "jocund rebec."

REBELLION (Lat. *rebellio*, from *bellum*, war, a revolt by nations subdued in war), an openly avowed renunciation of the authority of the government to which one owes allegiance, or a levying of war to resist the authority of the government. Unlike insurrection, which may be merely an opposition to a particular law, rebellion involves a design to renounce all subjection to the state. A *commission of rebellion* is a commission awarded against a person who treats the sovereign's authority with contempt, by not obeying his proclamation according to his allegiance, and refusing to attend his sovereign when required. It consists of four commissioners, who are ordered to attack the rebel wherever found. In Scotland, by a legal fiction, a debtor disobeying a charge on letters of horning to pay or perform in terms of his obligation, was accounted a rebel, as being disobedient to the sovereign's command contained in the writ. This disobedience was called civil rebellion, and the penal consequences of actual rebellion followed it, until they were abolished by 20 Geo. II. c. 50. By the old form of diligence (which is still competent), it has therefore been said that debtors were imprisoned not for debt but for rebellion. This fiction was discarded in the provisions of the statute 1 and 2 Vict. c.

114, simplifying the form of diligence and the steps by which imprisonment for debt is effected.

The expression "the great rebellion," is generally applied in England to the revolt of the Long parliament against the authority of Charles I. It began with the votes of the two houses regarding the militia in 1642, by which they endeavored to seize the military power of the country, and the departure of the king for York, which was immediately followed by the breaking out of hostilities. The civil war was, properly speaking, terminated by the submission of Charles to the Scots, in April, 1646; but the period of the rebellion is usually held to include the commonwealth or protectorate, and and to extend to the restoration of Charles II. in May, 1660.

The revolts in behalf of the house of Stuart in 1715 and 1745 are often, particularly in Scotland, spoken of emphatically as "the rebellion." The former rising in favor of the chevalier de St. George, son of James II. of England, called the old pretender, was headed by the earl of Mar, and put down in 1716: the latter was led by prince Charles Edward, known as the young pretender, who, landing in the Hebrides, was joined by the Highland chieftains and numerous followers, and after taking possession of Edinburgh, and marching to Derby, retreated into Scotland, and was defeated with great slaughter by the duke of Cumberland at Culloden, April 16, 1746.

REBELLION, WAR OF THE, the conflict between the northern and southern states of the union in 1861-65; ostensibly and immediately occasioned by disagreement between the two sections on the subject of slavery, but perhaps not less the result of long-standing political and economical differences, and of a general failure to assimilate on the part of the northern and southern people. The question of slavery had rested for 10 years after the Missouri compromise of 1821; but the formation of anti-slavery societies in the north in 1832, and the public agitation which followed, led by Arthur Tappan, William Lloyd Garrison, Wendell Phillips, and other prominent abolitionists, aroused a strong public sentiment in opposition to slavery. This sentiment found expression in the nomination of anti-slavery candidates for the presidency and vice-presidency at each election from 1840; by the introduction into congress of the "Wilmot proviso" in 1846; and by the John Brown raid at Harper's Ferry in 1859; while the opposition which it created was signified by the repeal of the Missouri compromise act in 1854; the "Dred Scott" decision in the U. S. supreme court in 1857; and the adoption of the Kansas (Lecompton) constitution of 1858. The John Brown affair (see BROWN, JOHN) had greatly intensified popular feeling north and south; and at the presidential election of 1860 four candidates were in the field: Stephen A. Douglas of Illinois, and John C. Breckenridge of Kentucky, nominated by the two wings of the democratic party; John Bell of Tennessee, nominated by the so-called "union," or compromise party; and Abraham Lincoln of Illinois, nominated by the republican party. The election was hotly contested, and during the campaign both sections were excited to fever heat by the powerful addresses made by the leading political speakers of all parties. Abraham Lincoln was elected president; the vote being: Lincoln, electoral 180, popular 1,857,610; Douglas, electoral 12, popular 1,365,976; Breckenridge, electoral 72, popular 847,952; Bell, electoral 39, popular 590,631. The result of the election was to precipitate rebellion. Nov. 7 the legislature of South Carolina called a state convention to consider the propriety of seceding from the union. This convention met at Charleston, Dec. 17, and on the 20th passed "an ordinance to dissolve the union between the state of South Carolina and other states united with her, under the compact entitled the constitution of the United States of America;" declaring that "the ordinance adopted by us in convention on the 23d day of May, in the year of our Lord 1788, whereby the constitution of the United States was ratified, and also all acts and parts of acts of the general assembly of the state ratifying amendments of the said constitution, are hereby repealed; and that the union now existing between South Carolina and other states, under the name of the United States of America, is hereby dissolved." This example was followed by secession acts similarly phrased, passed by the different southern states in the following order: Mississippi, Jan. 8, 1861; Florida, Jan. 10; Alabama, Jan. 11; Georgia, Jan. 19; Louisiana, Jan. 26; Texas, Feb. 1; Virginia, April 25; Arkansas, May 6; North Carolina, May 20; Tennessee, June 8. The avowed reasons for this course on the part of the states named were: "the refusal of fifteen of the states, for years past, to fulfill their constitutional obligations;" and "the election of a man to the high office of president of the United States, whose opinions and purposes are hostile to slavery." The states of Kentucky and Missouri were divided in sentiment on the question of secession, and thereafter had representatives in the governments and armies of both sections. Feb. 4, 1861, a congress met at Montgomery, Ala., in which were represented all the states which had passed ordinances of secession previous to that date. This congress adopted for the new organization of states a constitution, and the title "Confederate States of America." Jefferson Davis, of Miss., was elected president, and Alexander H. Stephens, of Georgia, vice-president, of the new confederacy. In the mean time the state forces of South Carolina had seized the U. S. custom-house, post-office, and arsenal in Charleston, and had taken possession of forts Pinckney and Moultrie in the harbor of that city; maj. Robert Anderson, in command of fort Moultrie, with a force of only 80 men, having withdrawn to fort Sumter, which he considered more

defensible. April 12, 1861, hostilities began with the bombardment of fort Sumter, which, after a brave defense, although several times set on fire by missiles, was surrendered on the 14th by maj. Anderson—the small garrison marching out with the honors of war. On the day following this event president Lincoln issued a proclamation calling for 75,000 volunteers for three months; and on May 3 a second call for 64,000 men for the army, and 18,000 for the navy, to serve “during the war.” The U. S. regular army consisted Jan. 1, 1861, of 16,402 officers and men; but these had been dispersed by Mr. Floyd, secretary of war under Buchanan, to the most distant parts of the country. Under his directions, also, vast quantities of arms and ammunition had been transferred from northern to southern arsenals during 1860; and the ships of the U. S. navy were mostly absent on foreign stations. It is to be observed here also that a very large proportion of the southern army officers resigned and entered the confederate service; this course was by no means so general on the part of southern born officers in the navy. In the southern states preparations for war were carried on with great energy. Gen. Robert E. Lee was appointed commander-in-chief of the confederate forces in Virginia, their main body being concentrated at Manassas Junction (Bull Run). The Mississippi river was blockaded by the confederates at Memphis, Tenn., May 10; the president of the United States proclaimed a blockade of all southern ports April 19; on June 10 a union force was repulsed by the confederates at Big Bethel, Va.; and on July 21 was fought the first battle of Bull Run, when the confederates, about 30,000 strong, under gens. Johnston and Beauregard, defeated the federals, in about the same force, under gen. Irwin McDowell, and threatened the capital. The union loss was 481 killed, 1011 wounded, 1460 missing; the confederates lost 378 killed, 1489 wounded, 30 missing. This was the first important battle of the war, and its effect was to rouse both sides to their uttermost, for what was now understood to promise a long and bloody struggle. Meanwhile, gen. George B. McClellan had succeeded in wresting the western portion of Virginia from the confederates; and, on the day following the disastrous defeat at Bull Run, he was appointed commander-in-chief of the army of the Potomac. His skill in organizing and disciplining large bodies of men, and making valuable soldiers out of raw and inexperienced recruits, doubtless qualified that army for the magnificent part it afterward took in the war. The congress of the United States met in extra session July 5, 1861, and the president called for men and money. To this congress responded by voting half a million men and \$500,000,000. At the south the enlistment of 400,000 men was going on under a call from the confederate congress. The northern states in their individual capacity had before this period drawn upon their own resources in behalf of the union cause: New York and Pennsylvania each voting \$3,000,000 for the prosecution of the war; Massachusetts and other New England states sending regiments into the field fully armed and equipped; while in every city, town, and hamlet volunteers were gathering and forming themselves into companies and regiments, to be afterward offered to the governors of the respective states, and through those officials to the country. The latter half of the year 1861 was devoted mainly to organization, and the engagements that occurred were generally without great importance. The confederates had possession of the U. S. arsenal at Harper's Ferry and the navy-yard at Norfolk, Va., where they had seized 2,000 cannon and the steam-frigate *Merrimack*, one of the finest in the U. S. navy. Oct. 21 they gained a success by almost annihilating the union force of 1500 to 1700 men under gen. Charles P. Stone and col. E. D. Baker, which had been sent to Ball's Bluff on the Potomac, and left there unsupported. Nov. 7 gen. U. S. Grant, after having seized Paducah, at the mouth of the Tennessee river, and another important strategic point at the mouth of the Cumberland, captured the confederate camp at Belmont, Mo., and thus checked the advance of gen. Jeff. Thompson with a rebel force in that direction. On the same date a U. S. naval force under admiral Dupont captured forts Walker and Beauregard at Port Royal, S. C. The following day became important in history as that in which the confederate commissioners Mason and Slidell were taken by capt. Wilkes of the U. S. frigate *San Jacinto* from the British mail steamer *Trent*, while on their way to their respective missions to England and France. This act, which was near involving the United States in a war with Great Britain, was disavowed by the U. S. government, and the envoys were surrendered, thus averting the danger. The union force in the field in the beginning of 1862 was about 450,000 men; the confederate force numbered about 350,000. During January some slight successes were gained in Kentucky, at Prestonburg and Mill Spring, by the federals under col. Garfield and gen. Thomas. Gen. Grant, aided by a naval force under commodore Foote, captured fort Henry on the Tennessee river Feb. 6; and ten days later gen. Grant attacked fort Donelson, on the Cumberland, which surrendered with 12,000 prisoners and 40 cannon. A naval expedition under gen. Burnside and commodore Goldsborough captured Roanoke island, New Berne, N. C., and Beaufort, between Feb. 8 and April 25. Mar. 9 occurred the remarkable naval engagement between the floating battery *Monitor* and the confederate iron-clad *Virginia* (formerly the *Merrimack*), resulting in the defeat of the latter off fortress Monroe, and her hasty retreat to Norfolk. This experiment with the *Monitor* was followed by the construction of a fleet of vessels after the same model by the U. S. government. On Mar. 8 occurred the battle of Pea Ridge, in western Arkansas, which lasted three days, in which the federals under gen. S. R. Curtis defeated the confederates under gen. Earl Van Dora. April 6 gen. Grant was defeated

at the battle of Shiloh, being driven to the Tennessee river; but renewed the battle with victory on the following day. On the same date gen. Pope and commodore Foote captured Island No. 10, in the Mississippi river, with 8,000 prisoners. Fort Pulaski, near Savannah, Ga., was bombarded and captured by maj. Gillmore April 11; and in this month the first attacks on the forts below New Orleans were made by admirals Farragut and Porter. The army of the Potomac, which had devoted its time during the winter of 1861-62 to organization, moved early in the spring to the peninsula formed by the James river and Chesapeake bay and gained the important battle of Williamsburgh in May, the evacuation of the town and works being the result of the attack by gen. Hancock, then in command of two brigades, and who bore the brunt of the fighting. After this battle the army of the Potomac advanced up the peninsula to the Chickahominy, and fought the desperate battle of Fair Oaks on May 31, which was a union victory; but the approach of Stonewall Jackson to co-operate with Lee made it necessary in the judgment of McClellan to effect a change of base to the James river, and this hazardous movement was accomplished at the expense of a series of the hardest fought engagements of the war—those of Oak Grove, June 25; Mechanicsville, June 26; Gaines' Mill, June 27; Savage Station, June 29; White Oak Swamp, June 30; and Malvern Hill, July 1. As a result of the peninsula movement and "the change of base," the advantage remained with the confederates, who had successfully defeated the original plan for the capture of Richmond by this route. Aug. 29-30 occurred the second battle of Bull Run, between the union forces commanded by gen. John Pope and the confederates under Lee, Jackson, and Longstreet. Pope was utterly defeated, and his broken and dispirited columns driven back upon Washington, the union losses being about 11,000 and the confederate 8,000. McClellan, who had been removed from his command, in favor of Pope, was now hastily recalled; and on Lee advancing into Maryland, defeated and routed him at South Mountain and Antietam, Sept. 14 and 17, and Lee was driven across the Potomac. Harper's Ferry, which had been evacuated by the confederates in June, 1861, was recaptured by Stonewall Jackson Sept. 15, 1862, when 11,583 men and a vast quantity of munitions of war fell into the hands of the confederates. Nov. 7, gen. McClellan was superseded by gen. Burnside, by order from Washington and against the wish of the latter; and Burnside was immediately defeated disastrously at Fredericksburg, Va. (Nov. 13), with a loss of 12,000 men. On Jan. 25, 1863, gen. Burnside was relieved by gen. Hooker, who was defeated at Chancellorsville, May 2-4, losing more than 11,000 men. Lee followed up his success by invading Maryland again, and early in June made a descent on Pennsylvania. June 28, Hooker was relieved from the command of the army of the Potomac, which was bestowed on gen. George G. Meade, and the latter at once pursued the confederates with such celerity and determination, that Lee was forced to stop and give battle. The field of the battle of Gettysburg was appointed by gen. Hancock, at the request of gen. Meade that he should use his own judgment as to the best spot to fight. Meade's own preference was for Pipe-clay creek, some distance away from the chosen field. Gen. Hancock commanded the left-center of the line during the battle, which lasted July 1-3, and was shot from his horse on the last day, and dangerously wounded. Gen. Reynolds was shot in the first day's fight, and instantly killed. The result of the three days' battle was a complete union victory, there being between 70,000 and 100,000 engaged on either side; the loss of the confederates 36,000; the union loss 23,190. The rapid movement and skillful generalship by which gen. Meade intercepted gen. Lee, and forced him back into Virginia, may be esteemed among the most brilliant acts of the entire war. Lee, having recrossed the Potomac, now retreated to a position on the Rapidan, and strategic movements on the part of the two armies occupied the time until winter, accompanied by occasional heavy skirmishing.

In the west, during 1863, Memphis and Vicksburg had fallen, the latter almost at the moment of the decisive victory of Gettysburg, and gen. Grant, in command of the army of the Mississippi, was beginning to achieve his position as the leading soldier of the war. Gen. Morgan was raiding in Indiana; Rosecrans had driven the confederates under gen. Bragg from middle Tennessee, and over the Cumberland mountains; the federals had been defeated at Chickamauga, and the rebels at Lookout mountain and Missionary ridge; and the union forces held Missouri, Arkansas, Kentucky, Tennessee, a large part of Louisiana, Mississippi, and Florida, and the Rio Grande frontier of Texas, and had control of the Mississippi river. A draft in the northern states for 300,000 men, with an exemption clause, had added 50,000 men to the union armies, and the sum of \$10,518,000 available for bounties.

The year 1864 opened with a slight advantage on the side of the confederates. Certain Red river expeditions under gens. Banks and A. J. Smith proved disastrous to the federal forces engaged, admiral Porter being in danger of losing his fleet below Shreveport. Farragut with gen. Butler had captured New Orleans in the spring of 1862—a brilliant naval achievement; the latter had also taken Natchez; and in Aug., 1864, Farragut rounded off his career of splendid service in the war by reducing the forts at the entrance of Mobile bay, and destroying the confederate fleet. Gen. Grant had been made lieut. gen. and commander-in-chief in March (1864); had turned over his command in the west to Sherman, and taken command of the army of the Potomac; and now a combined movement against the confederates, east and west, was to be made under the personal direction of these two great generals. Sherman's army was in motion from

Chattanooga by May 7, and forced gen. Johnston and afterward gen. Hood through Georgia, as far as Atlanta, defeating the confederates at every point. A siege of the fortifications of Atlanta, which lasted two months, finally placed Sherman in possession of that city. In the meantime the army of the Potomac, with gen. Meade in immediate command, had broken camp on the Rapidan, and undertaken the tremendous campaign of the "Wilderness," with the design of forcing the fighting straight to Richmond. During this campaign of 43 days, more than 100,000 men on each side, with constant re-enforcements, were engaged almost continuously in the battle of Spotsylvania courthouse, the sharp engagements on the North Anna, and the disastrous defeat of the union army at Cold Harbor, until, on the night of June 12, the army of the Potomac crossed the Chickahominy and took position on the s. side of the James river. The design of this movement was to threaten Richmond by way of Petersburg, and to thwart it. Lee at once threw a large portion of his army within the defenses of the latter city, which proved to be impregnable to assault, and only to be reduced by regular approaches and a skillful siege. While this siege was being conducted, gen. Sherman had made his now celebrated "march to the sea," carrying his compact army of 60,000 men from Atlanta through the heart of Georgia, leaving the former city on Nov. 15, and reaching Savannah on Dec. 10; carrying fort McAllister by assault on the 13th, and occupying Savannah itself on the 20th. While Sherman was thus successful, the confederate gen. Hood had invaded Tennessee, driving the federal forces under gen. Thomas from point to point, until finally himself defeated near Nashville, Dec. 15, with a loss of more than 13,000 prisoners and 72 pieces of artillery.

The presidential election in 1864 found Abraham Lincoln renominated by the republicans, and gen. McClellan by the democrats. Twenty-five states took part in this election; the electoral vote was 233, of which Lincoln received 212; the popular vote of Lincoln and Andrew Johnson of Tennessee, was 2,223,035, and that of McClellan and Pendleton 1,811,714. During December and January gen. Sherman had remained in Savannah, resting his troops; but on Feb. 1, 1865, he again took the field. Marching through South Carolina, he took possession of Columbia; and on the following day, Feb. 18, Charleston surrendered to the union force under gen. Gillmore, which had been engaged in the siege of that city since July 10, 1863, during which time it had been under bombardment 542 days. Sherman now pushed on into North Carolina, while two other union armies, under Schofield from New Berne, and Terry from Wilmington, co operated with him; the three armies meeting at Goldsborough, N. C., Mar. 22, while gen. J. E. Johnston, with the main army of confederates in that region, was being held at bay at Raleigh. On Mar. 24 gen. Grant issued an order for a combined movement of the armies operating against Richmond, to take place on the 29th. But on the 25th gen. Lee made a desperate attempt to break through the federal lines on the Appomattox river, and fort Steedman was captured by the confederates, but soon retaken. April 1 gen. Sheridan defeated the confederates at Five Forks—which protected the South-side railroad, and thereby Lee's connections with Richmond—and captured 6,000 prisoners. This was the final and irretrievable blow to the confederate army. On the following day, April 2, gen. Grant attacked along the whole line in front of Petersburg, and on the evening of that day both Petersburg and Richmond were abandoned. Gen. Lee retreated toward Lynchburg, but was intercepted by Sheridan, and on April 9 surrendered his army to gen. Grant at Appomattox Court-house. Gen. Johnston surrendered his army on April 26; on May 4 gen. Taylor surrendered the confederate forces in Alabama to gen. Canby; and the last fight of the war of the rebellion took place May 13, 1865, on the Rio Grande, in Texas, between col. Barrett, in command of the federals, and gen. Slaughter, confederate, in which, strangely, the confederates were victorious. The last confederate army in the field—the trans-Mississippi—was surrendered by Kirby Smith on May 26. The number of union soldiers in the field during the war was 2,666,999; the number drafted and held to service being 46,247; furnished substitutes, 73,607; paid commutation, 86,724; total drafted, 206,678, to which should be added 87,588 credited to the states under the draft of 1862; making in all drafted, 294,266. The amount of commutation moneys received by the government was \$26,366,316.78; the amount of bounties paid by the U. S. government was \$300,223,500; by state and local authorities, \$285,941,036. The casualties in the army numbered 280,739: 5,221 officers and 90,868 men killed in action or died of wounds; and 2,321 officers and 182,329 men died from disease or accident. The entire available force capable of active service in the field, enrolled in the confederate armies, was 600,000 men; their entire loss during the war was more than one-half this number.—During the war confederate cruisers, fitted out mostly in British ports, scoured the ocean, doing irreparable damage to the commerce of the United States. Among these, the most prominent were the *Alabama*, *Florida*, *Georgia*, *Sumter*, and *Tallahassee*. The *Alabama*, Raphael Semmes commanding, was sunk off Cherbourg, in France, June 19, 1864, by the U. S. S. *Kearsarge*, commanded by capt. Winslow. After the evacuation of Richmond, Jefferson Davis, president of the confederacy, fled south, and was captured May 10, 1865, at Irwinsville, Ga., by gen. Wilson's forces, as he was attempting to make his further escape in disguise. In company with certain others of the prominent leaders of the rebellion, he was imprisoned for a time; but no man was eventually punished for participation therein.—The most important political act of the rebellion was the "eman-

cipation proclamation," issued Jan. 1, 1863, which gave freedom to 4,000,000 of slaves. Its most characteristic infamy was the assassination of Abraham Lincoln on the night of April 14, 1865.

REBUS, an enigmatical representation of a name or thing by using pictorial devices for letters, syllables, or parts of words. The term probably originates from the device speaking to the beholder *non verbis sed rebus*. Devices of this kind, allusive to the bearer's name, were exceedingly common in the middle ages, particularly in England. In many instances, they were used by ecclesiastics and others who had not a right to armorial ensigns. Thus, on the rector's lodgings at Lincoln college, Oxford, erected in the 15th c., to which Thomas Beckington, bishop of Bath and Wells, liberally contributed, is carved the rebus of that prelate—a beacon and tun, with *T*, the initial letter of his Christian name. In Westminster abbey, abbot Islip's chapel gives two forms of his rebus—one, a human eye, and a small branch or slip of a tree; the other, a man in the act of falling from a tree, and exclaiming, "I slip!" Many of the monograms of the artists of the middle ages and early printers were rebuses. That of Ludger von Ring was the letter *L* inserted into a ring. A large proportion of the early coats of arms were rebuses on the names of the bearer of them, as for example, three salmon for the name of Salmon, a lock and heart for that of Lockhart, three skenes or dirks for Skene. Family badges are also frequently of the nature of a rebus, and mottoes, as *Ver non semper viwet* of the Vernons.

RÉCAMIER, JEANNE FRANÇOISE JULIE ADELAIDE BERNARD, DAME, perhaps the finest representative specimen, in later times, of that character peculiarly French, the "woman of society," the potentate in petticoats, who sways the *salon*, and out of it becomes in doing so a sort of "unacknowledged legislator"—was born at Lyons in Dec., 1777. Her father was a banker of that city, and, as well as her mother, was distinguished by much of the personal grace and charm which, in the daughter, seem to have culminated, as it were, in a form of almost typical perfection. She was beautiful, and in rare measure possessed, as the soul of her beauty, the woman's undefinable fascination, the *je ne sais quoi* of her country. She was educated under the charge of an aunt in the convent of La Déserte; and at about the age of 15, she went to Paris to join her parents, who had some time before migrated thither. Shortly after, she was married to M. Jacques Récamier, a rich banker about three her own age. The union is said to have been scarcely in the ordinary sense connubial ("M. Récamier n'eut jamais que des rapports paternels avec sa femme") but a mutual affection and respect informed it from the first, and consecrated it to the end, as passion might possibly have failed to do. A record of the splendid social triumphs of Mme. Récamier would involve notice of nearly all that was distinguished in Paris during a space of about fifty years. In that strange, impalpable, yet most real way, of which, in this country, we can have only a faint and also coarse conception, she became a power; and she continued so; and this despite changes of fortune, which, among us, would have involved the extinction of even a more solid celebrity. To the famous Mme. de Staël she was bound by ties of extreme affection and intimacy; and when her friend was banished from Paris, as having drawn on her the little jealousy of Napoleon, she lavished her sympathy on the brilliant exile. Sometime after, the complete ruin of her husband's fortunes induced her to accept an invitation from Mme. de Staël to join her at Coppert in Switzerland (1806). Here she was thrown into the society of prince August of Prussia, and a mutual attachment ensued. It is supposed that, of all her innumerable admirers, he alone succeeded in touching her heart. A marriage was arranged, the necessary condition of which was the consent of M. Récamier to a divorce. This was not refused; but his mild and touching remonstrance sufficed to divert from her purpose a woman, on the one hand, of generous and noble feeling, and probably, on the other, constitutionally incapable of any very vehement passion. The man whose brilliant prosperities she had shared, she shrunk from deserting in the decay of fortune which had by this time befallen him. The devotion of her princely lover continued till his death in 1845; but it does not appear that after his first distinct failure—though he frequently again met his beloved—his efforts to secure her were very vigorously renewed. The lady's genius for love does not seem to have been great; but for friendship, it was almost unexampled. The most distinguished *ami* of her later years was M. de Chateaubriand, who solaced himself in his peevish decline by an almost daily visit to her. In 1846 he became a widower, and he then wished to marry Mme. Récamier, a widow since 1830; but the lady declined the honor—wisely for herself and for M. de Chateaubriand. Till the last day of Chateaubriand's life, he found—though his hand had been refused by her—in the friendship of Mme. Récamier almost his only source of cheer and satisfaction. Chateaubriand died July 4, 1848, and Mme. Récamier followed him on May 11, 1849. She died not so much of grief as of cholera, a disease of which her dread had always been great; and dying, she left behind her a reputation which must continue to give her a historic place among the French queens of society. If not quite so brilliant as some of them, she was obviously much more correct than most, on a ground of virtue or of coldness. Specially brilliant she was not; but she seems to have moved in some atmosphere breathed about her of bewildering charm and fascination. Passion, in its fiercer sense, she had not in herself, nor does she seem much to have inspired it; but the genius of refined *philander-*

ing, as it is termed, was probably never more exquisitely embodied. See *Souvenirs et Correspondance tirés des Papiers de Mme. Récamier* (Par. 1859).

RECANA'TI, a t. of central Italy, in the province of Macerata, on the Musone, 14 m. s. from Ancona. It is a station on the railway between Ancona and Rome. Recanati was a powerful military position in the 11th c.; great privileges were bestowed on it by the emperor Frederick II. in 1229, when the whole line of coast from the Potenza to the Musone was granted to it for the erection of a port. Pop. above 6,000.

RECEIPT is the technical as well as popular term signifying a legal acknowledgment of money received in discharge of a debt or demand. It is often popularly believed that a written receipt is the only legal proof of payment; but this is a mistake, the fact being that it is only one mode of proving it. If the money be paid in presence of witnesses, or even without witnesses, provided a jury or judge believe the statement on oath of the party paying it, this is, in England, quite as good evidence of the payment as if a written receipt were given; and even a written receipt is not conclusive, for it is subject to explanation, and if it was obtained in advance of a payment which never followed, or by fraud, it goes for nothing as a discharge of the debtor. If a receipt is in writing, and the sum paid exceeds 40s., it must be stamped with a penny receipt-stamp (which may be an adhesive stamp), otherwise the receipt is inadmissible as evidence of payment. Not only is a receipt proper subject to stamp-duty, but also any note or memorandum given to a person on payment of money, and acknowledging payment of any part of a debt or demand, whether signed or not; so receipts given on payment of bills of exchange or promissory-notes, are liable to stamp-duty. But there are several exceptions from liability to stamp-duty. Such are receipts for deposits with bankers (except when paid on allotment of shares, or in respect of calls on shares); receipts as to the assessed taxes—for land-tax, income-tax, and payments to the crown; receipts by officers, seamen, marines, or soldiers for wages or pay; receipts for purchase of government stock; receipts written on the back of duly stamped bills of exchange or promissory-notes, or upon the back of duly stamped purchase-deeds. Where a debtor tenders money, but requires a stamped receipt at the same time, he ought to provide himself with paper, and stamp, and writing materials, for the creditor is not bound to supply these. In Scotland, the receipt of money cannot be proved by witnesses, where the debt was created by writing, and it is not allowed to dispute the validity of a written receipt, except in cases of fraud.

RECEIVERS, officers appointed by the court to receive and hold money for the use of others and to render an account of the same, or in equity proceedings to receive the rents or profits of land or the profits of other property the ownership of which is in dispute. The receiver acts as the ministerial agent of the court, and must be without any personal interest in the disputed question. The cases in which the appointment of such an agent is most common are such as the winding up of business corporations, insurance companies, and banks, and in the dissolution of partnerships by suit brought by one partner against his copartners. Where judgment has been rendered against a debtor but cannot be satisfied by levy and execution, on application of the creditors a receiver may be appointed to collect assets payable to the debtor and apply them on the judgment. It is by statute provided in most states that receivers may be appointed in certain cases, and especially in winding up the affairs of a bankrupt or insolvent corporation, and the duties and responsibilities of the position are carefully defined. After the appointment the owner can exercise no rights of ownership over the property. The receiver may bring suits, but only after obtaining authority for each case from the court, and he is secured from all suits brought against him without permission from the same source. An attorney or solicitor will not be appointed by the court. When once appointed the receiver has a vested legal right in the property or assets as trustee, and in order to defend the rights of the interested parties may do any act which an owner might do, being accountable only to the court from which he derives his authority. He is liable in damages for loss of value by the negligent or dishonest execution of his trust, but is bound to use only the ordinary care required of a bailee for a consideration. As a rule, receivers will not be appointed where the property is already in the court's possession, or where the applicant has possession under a legal title, or where his equitable title is defective.

RECEIVING STOLEN GOODS is a criminal offense, distinct from larceny. It implies that the goods were received with the knowledge that they were stolen. The offense is felony, and punishable with penal servitude from 3 to 14 years; or 2 years' imprisonment, with or without hard labor. In cases where the stealing is only a misdemeanor, then the receiving is also only a misdemeanor; and where the taking of property is an offense punishable on summary conviction, the receiving with knowledge is punishable in the same way. It is sometimes extremely difficult to distinguish between the case of a receiver and of one who is a party to the stealing, or a principal. The thief may be a witness against the receiver.

RECENT, or **HUMAN PERIOD**, in geology, is the title given to the epoch that has elapsed since man made his appearance on the globe. The causes that operated throughout the ages of geological time to produce the changes recorded in the various sedimen-

tary deposits, did not terminate with the beginning of human history, but have been ever acting since man was able to observe and to record his observations, and are still in progress around us. The solid earth is being washed away by atmospheric agency, and the abraided portions are continually carried away slowly and imperceptibly by streams and rivers, to form new deposits in the depths of inland lakes or of the ocean. Volcanoes are throwing up lava and scoriae, and earthquakes are elevating portions of the earth's surface in one place, and depressing them in another; and plants and animals are, either with their living bodies, or their dead exuviae, forming, as in past ages, deposits in various places, as in the foraminiferous ooze of the deep ocean, and the enormous coral reefs of the eastern seas, or the peat-mosses and diatomaceous earths of temperate climes. The record of all these changes, and the remains of man and of the plants and animals which the strata produced by them contain, have for some years received great attention. As they form common ground for the antiquary and geologist, they have been diligently investigated by the students of both sciences. The classification adopted for the subdivision of the recent period is based on what is supposed to have been the progress of human civilization. The first rude inhabitants of a country seem to have been acquainted only with stone implements. Their hammers, knives, and spears were made of stone, sharpened by chipping the edges, and subsequently by grinding and polishing. In Denmark, these stone implements are found buried in peat-mosses, associated with the remains of plants and animals that still live in that or neighboring countries. The common tree in these mosses is of Scotch fir, which has not been a native of Denmark during historical times. Of the same age are the "kitchen-middens," found on the coasts of the Danish islands in the Baltic. They are mounds of the shells of the oyster, cockle, periwinkle, and other edible mollusca, like those formed by the North American Indians on the eastern shores of the United States. The implements found in them are formed of stone, sometimes of wood and bone, but never of metal. Similar "middens" have been described as occurring in various places in the n. of Scotland. The people who built the earliest of the lacustrine habitations of Switzerland were also unacquainted with the use of metals. See CRANNOGES. The paucity or almost absence of human bones in such early deposits, whether in Denmark or Switzerland, is attributed by antiquaries to the supposed practice of burning the dead.

While the lower portion of the Danish peat-mosses is characterized by the presence of stone implements and the trunks of Scotch fir, the upper portions of the same mosses abound in trunks and acorns of the common oak, and with these are associated implements and articles of bronze. In many of the Swiss pile buildings, the bronze implements also supplanted those of stone. The various articles exhibit a considerable advance in civilization, as is to be expected from the using a metal, the possession of which implies the existence of foreign commerce, since tin was in ancient times only obtained from Cornwall.

In progress of time, the oak in its turn disappeared from the surface of Denmark, and was followed by the beech, which still continues to flourish luxuriantly in Denmark. The use of bronze also gradually gave way before the now discovered iron. A few of the lake buildings seem not to have been abandoned until after the inhabitants became acquainted with the use of iron, as some articles made of this metal have been found at Nidau.

While it is useful thus to characterize the various steps in the civilization of man, and to associate them with the strata in which they occur, it would be a source of endless error to suppose that all such strata are contemporaneous; for the various ages have really existed at the same time not only in different countries of the world, but even in contiguous regions, and probably implements of the three materials have been used at the same time by different inhabitants of the same district. See BRONZE, AGE OF. The occurrence, then, of stone implements in several deposits exhibits not a similarity of age, but a similar stage of advancement in civilization, consequently no dependence can be placed on those calculations which trace back the iron, bronze, and stone periods as if they had preceded each other in regular chronological series, and each had occupied a given number of years.

RECEPTACLE, in botany, the expanded and abbreviated termination of a floral axis, bearing many flowers close together, as in the *heads of flowers of the composite* and in the fig. The receptacle assumes a great variety of forms, and sometimes, as in the fig, becomes a chief part of the fruit. It is the eatable part of the artichoke, and the "cheese" of thistles, so well known to school-boys. The name receptacle is sometimes also given to that part of a single flower from which the whorls of floral envelopes and parts of fructification, or some of them, spring; which, however, is more properly called the *thalamus* or *torus*.

RECEPTION, RELIGIOUS, of monks, nuns, and other religious persons, is the ceremonial whereby they are admitted to the probationary state called the novitiate (q.v.). Before the ceremony of reception, a short preparatory stage must be passed through by the candidate (called at this stage a "postulant"), the duration of which usually ranges from two to six months. The ceremony of the reception, called also "clothing," is performed by a bishop, or a priest delegated by a bishop, and consists in blessing the religious dress or habit, and investing the postulant therein with appropriate prayers, the

hair being at the same time cut off, and the secular dress laid aside, in token of the renunciation of the world and its pomps and pleasures. The reception, however, is understood to be only a provisional step; and the novice remains free to return to secular life at any time during the novitiate.

RECHABITES. In I. Chron. ii. 55, the house of Rechab is identified with the Kenites who came into Canaan with the Israelites; one branch of them settling in the n. part, and another in the territory of Judah. From the book of Jeremiah it appears that they remained in the land until the Babylonian captivity, and during several generations obeyed the command of Jehonadab, their founder, not to drink wine, sow seed, plant or own a vineyard, or build houses, but to dwell in tents forever, that they might live many days in the land where they were strangers. When forced to seek shelter from the Chaldeans within the walls of Jerusalem, they still refused to violate these injunctions of their ancestors. Their example was placed by the Lord in strong contrast with the transgressions of his own commandments by the Jews. "The sons of Jonadab have performed the commandment of their father which he commanded them; but this people hath not hearkened unto me." "Jonadab the son of Rechab shall not want a man to stand before me forever." There are implications that they were admitted among the Levites. After the captivity one of the tribe was ruler of a part of Jerusalem, and rebuilt one of its gates. In I. Chron. ii. 55, they are mentioned among the scribes who were chiefly, if not exclusively, Levites. Hegesippus, in a passage quoted by Eusebius, says that, while the scribes and Pharisees were stoning James the just, one of the priests of the sons of Rechab, who are mentioned by Jeremiah the prophet, cried out, probably against the crime. Benjamin of Tudela, in the 12th c., in the record of his travels, says that near El Jubar he found Jews 100,000 in number who were named Rechabites. They tilled the ground, kept flocks and herds, and abstained from wine and flesh. Dr. Wolff, a traveler of the present century, says he found 60,000 bearing the same name; and a later traveler still, about 1860, met a tribe that called themselves by the same name.

RECIFE. See **PERNAMBUCO**, *ante*.

RECIPROCAL (Lat. *reciprocare*), a term which is employed in mathematics in a sense analogous to that attached to it in ordinary language. A geometrical proposition is the reciprocal (or *inverse*) of another, when the "data" of the one are the "quesita" of the other, and *vice versâ*. In algebra, one quantity is the reciprocal of another when the one is the result of unity divided by the other; thus, 2 and $\frac{1}{2}$, x and $\frac{1}{x}$, $\frac{a}{b}$ and $\left(1 + \frac{a}{b}\right)$ or $\frac{b}{a}$, are reciprocal quantities. The product of a quantity by its reciprocal must always be unity. *Reciprocal or inverse proportion*, a term formerly much used in arithmetical treatises, but now, and with much propriety, generally disused, referred to such questions as the following: If a rectangular field be 800 yards long and 240 broad, what must be the breadth of another rectangular field of equal area which is 960 yards long?—the answer being 200 yards. In this question we see that the breadths are not proportional to the lengths, but to the reciprocals of the lengths; thus, $\frac{1}{800} : \frac{1}{960} :: 240 : 200$; but in all such problems, it is better for the pupil to be left to exercise his judgment in applying to them the ordinary rule of proportion.

RECITATIVE (Ital. *recitativo*, from *recitare*, to recite), a species of vocal composition which differs from an air in having no definite rhythmical arrangement, and no decided or strictly constructed melody, but approaches, in tonal succession and rhythm, to the declamatory accents of language; it is, in fact, as near an approach as possible to speech delivered in musical sounds. Recitatives are not performed in any strict species of time, the length of the notes depending on the singer, who lengthens or shortens them according to the expression required. It is, however, usual to note a recitative in common time, in order to facilitate the reading; and when any part of a recitative is to be performed in strict time, this is indicated by the words *rec. a tempo*. When a recitative is accompanied merely by a few simple chords of an instrument, to indicate to the singer the pitch and the harmony, it is called *recitativo secco* or *parlante*, declaimed recitative. When the voice is accompanied by a considerable portion of the instruments of the orchestra, either in sustained chords or florid passages, it is termed *recitativo accompagnato*, *strumentato*, or *obbligato*. Recitative was largely used in the ancient drama; and is used in the opera to express some action or passion, to relate a story, reveal a secret or design, &c. It is said to have been first introduced in the opera by Emilio del Cavaliere at Rome.

RECLAIMING, in the law of Scotland, means the appeal from a judgment of the lord ordinary to the inner house. The reclaiming days are ten days after judgment, except against interlocutors disposing in whole or in part of the merits of the cause. The step by which the appeal is commenced is a reclaiming note.

RECLUS, JEAN JACQUES ELISÉE, b. 1830 in the Gironde; son of a Protestant pastor, and early noted for his devotion to republican principles. After the *coup d'état* of Louis Napoleon in 1851, forced to leave France, he traveled in Great Britain, the United States,

and South America, and remained for several years in New Granada. Returned to France in 1857, he became editor of the *Revue des Deux Mondes* and of the *Tour du Monde*, etc. On the breaking out of the war of secession in the United States, his articles were of conspicuous value in giving a clear view of the nature of the struggle, and directing public sympathy to the administration of Lincoln; for which the American minister in Paris thanked him. He aided in the production of the *Guides Joanne*, remarkable for their accuracy of information and charm of style; and is conspicuous for his popularization of scientific studies for youth. His repugnance to the Napoleonic reign induced him to join the internationals in 1869. During the siege of Paris in 1871 he served as common soldier; was author of the *Cri du Peuple* published in March of that year; a soldier of the commune, in the balloon service, taken prisoner by the troops of the government, and banished from France. Charles Darwin and other distinguished scientists united in a petition to the French government for his recall, on the ground of the services which he had rendered to science and popular education, and the value of his continuance of similar service; but Reclus, who had established himself in Switzerland, refused to return except under a general amnesty to all the members of the commune government. He was made a member of the central committee of the geographical society of Paris in 1869. Among his numerous works, *La Terre*, in 2 vols., beautifully illustrated, published 1867-68, is the most elaborate, though his books of travel were the basis of his reputation.

RECLUSE (Lat. *reclusus*, also *inclusus*, shut up), a class of monks or nuns who, from a motive of special penance, or with a view to the more strict observance of Christian perfection, remained shut up from all converse, even with members of their own order, in a cell or other place of strict retirement. This practice was not allowed, except to persons of tried virtue, and by special permission of the abbot; and the recluse was, with due solemnity, locked up in the presence of the abbot or the bishop, who placed his seal upon the door, not to be removed without the authority of the bishop himself. The celebrated mediæval theologian, Rabanus Maurus, was a recluse, when elected archbishop of Mentz. Nuns also were found to practice the same voluntary seclusion, especially in the Benedictine, Franciscan, and Cistercian orders. A rule, specially designed for female recluses, was composed by Ælred of Reresby, and is preserved by Holstenius in his *Codex Regularum Monasticarum*, vol. i, p. 418, and following.—In a wider sense, the name recluse is popularly applied to all cloistered persons, whether men or women, even those who live in community with their brethren.

RECOGNIZANCE is a kind of judicial bond entered into with a court of record, the object of which is to secure the doing of some act, as the appearance of witnesses at a criminal trial, or the keeping of the peace by one who has threatened or assaulted another. The form of it is thus: "A B doth acknowledge to owe to our lady the queen the sum of ten pounds," or some other sum to be levied of his goods if he fail in the condition endorsed; and then a condition is added, which states that if the thing secured is done, then the recognizance is to be void. This is the mode by which justices of the peace secure the attendance of the prosecutor and witnesses at the trial of a prisoner who has been committed for trial, or the future good behavior of one who has committed a breach of the peace. If the thing secured is not performed, then the party bound forfeits his recognizance, that is, a debt of the amount specified becomes forthwith due to the crown.

RECOGNIZANCE (*ante*), in law, is defined by Blackstone as "an obligation of record, entered into before a court or officer duly authorized for that purpose, with a condition to do some act required by law which is therein specified." In criminal cases it is taken by the judges of the different criminal courts, by justices of the peace, or in some cases by the sheriff; but in capital crimes, as a rule, by the court of highest jurisdiction. In civil cases it is taken by the court, or by magistrates duly authorized by statute. It is a memorandum made on the record by the court or other authority. It does not require the signature of the party who is to appear. Loss of custody by the government without fault of the bail, or surrender of the defendant at any time before a certain period after the sheriff has returned *non est*, a discharge of the principal under bankruptcy or insolvency, etc., discharge the bail. The remedy on a recognizance is by *scire facias* against the bail. See **PAIL**.

RECOIL. When the charge of gunpowder contained in a gun is fired, the sudden expansion of the powder into many times its former bulk acts with equal force in every direction. The resistance offered by the ball, which moves more or less easily in the bore, being far less than that of the bulky and heavier gun and carriage, the ball is forced to a great distance; but the gun, with its carriage, must nevertheless feel the reaction, and is driven backward a certain space, ordinarily a few feet. This retrograde motion is called the recoil, and dangerous accidents sometimes take place from it. After the recoil, the gunners have to work the piece back to its former position for the next discharge. In the Armstrong naval gun, and some other modern cannon, the trunnions of the gun are mounted on an inclined plane, up which the recoil drives them, to run down again by their own weight. See also the description of the Moncrieff GUN-CARRIAGE. Other expedients have been tried with greater or less success; among them may be cited a series of solid India-rubber buffers, which, being compressed by the

recoil, drove the gun home again on recovering their shape. The gun and shot remaining the same, the recoil is proportionate to the charge.

The recoil of small-arms is known as their "kick," and is felt on the shoulder of the marksman.

RECOLLET (Lat. *recollectus*, gathered together), a name given to the members of certain reformed bodies of monastic orders, whether of men or women, in the Catholic church. Among orders of men, an offshoot of the Augustinian hermits, which, under Louis de Montaya, in 1530, obtained considerable popularity in Spain, was called by this name, and the order still exists at Medina Sidonia, Leon, and Pamplona; but outside of Spain this order is better known under the title of the REFORMED FRANCISCANS, who were established in France under Henry IV. and Louis XIV., and spread thence into Belgium, their houses in these countries and Germany becoming so numerous that they reckoned no less than ten provinces. A reform of the Cistercian order of nuns in Spain was called by the same name.

RECONNAISSANCE, RECONNOITER, the noun and verb expressive of the operation of inspecting a country in which military operations are intended. This duty devolves on the department of the quarter-master general, and requires the exercise of qualities of a very high order. The officer deputed to reconnoiter is well mounted, and accompanied by a small escort, also well mounted, in order to escape if noticed by the enemy. His duty is to measure every natural feature in his district by eye, or by more accurate measurement when practicable, and to produce a map, showing hills, valleys, streams, canals, plains, woods, etc. He must at the same time note all obstacles; what resources the country possesses to maintain men or horses; what the disposition of the inhabitants, etc. Reconnoitering is necessarily a very dangerous service; an officer so employed has often to resort to disguises, and if taken, runs some risk of being treated as a spy.—A maritime reconnaissance is analogous.

RECORD, as a legal term, is used in the United Kingdom to signify the formal statements or pleadings of parties in a litigation. In general, the rule is well settled that the pleadings which make up the record do not enter into details of the evidence, but merely set forth the conclusions or inferences, leaving the details of evidence to be supplied at the trial before a jury, or, if there is no jury, at the hearing before the judge or court. All the higher courts file the records in the suits, and are called courts of record, and one of the incidents of a court of record is that the court or judge can commit for contempt any person who insults the court, or willfully obstructs the business. A trial by record means that one of the parties has set up some former decision of the court, while the other denies that such a decision ever existed; whereupon the only mode of solving the question is by producing the record of the former action, and so settling the dispute. In the courts of common law of England, the parties, by the rules of pleading, come to an issue at last, after mutually answering each other, and the issue is either some short point of fact or of law. No intervention of the judge or court is necessary to come to an issue. In Scotland, however, the closing of the record is a formal step which requires the sanction of the judge, who closes the record after each party has said all he wishes to say by way of statement and answer. See also REGISTRATION.

RECORD OF CONVEYANCES, by public officers and for the public to examine at will, is universal in the United States, but unusual, incomplete, and imperfect in England. The statutes of each state provide for the appointment of an officer, sometimes called the register of deeds, whose duty it is to receive and record all warranty and quit-claim deeds, mortgages, and assignment of the same and leases for a term beyond a specified limit, which may be presented in properly authenticated form. The duties of this office are very often made part of the county clerk's functions. The recording officer must certify that the conveyance has been presented and recorded at the specified date. Conveyances made after the first is recorded are void, and any conveyance not recorded is void as against a subsequent *bona fide* purchaser from the person in whose favor a recorded conveyance has been executed. But between the parties to the conveyance the recording or non-recording is of no moment. As a rule also the rights which have accrued to any party before the registry cannot be affected by such recording. But how far the recording is to be regarded as a constructive notice and to whom it acts as notice, are matters governed entirely by the state statutes. It is usual to allow a properly recorded deed to be introduced in evidence without further proof of its execution, and in some states the record itself is admitted as evidence. It is generally held that actual notice received by a second purchaser or mortgagee destroys all priority of claim which would otherwise arise from his being the first to record his conveyance. Differing views are held by the courts as to what circumstances will constitute a good notice.

RECORDE, ROBERT, generally allowed to have been the greatest English mathematician of the 16th c., but now almost forgotten, was b. about 1500 at Tenby, in Pembrokeshire, Wales. He completed his education at Oxford, and there distinguished himself in mathematics, rhetoric, music, and anatomy; but wishing to make medicine his profession, he removed to Cambridge, and there, in 1545, he received the degree of M.D., "being much admired by all who knew him for his profound and varied knowledge of art and

science." In 1547 he was in London, engaged in the composition of the *Urinal of Physic* (1548), a work which saw five editions; and was about the same time appointed family physician to Edward VI., and afterward to queen Mary. Ten years after this we find him in the debtors' prison in London, where he died miserably in 1558. His works are all in the form of dialogues between a master and his pupil, and are written in the rude English of his time; they are—*The Gate of Knowledge*, and *The Treasure of Knowledge*, two works which seem to be completely lost; *The Ground of Arts, teaching the Perfect Work and Practice of Arithmetic*, etc. (Lond. 1549), an arithmetical work which has been frequently reprinted, and which exhibits a curious "mélange" of the Arabic and Roman notation; *The Pathway to Knowledge* (Lond. 1551), an abridgment of Euclid's *Elements*; *The Castle of Knowledge, containing the Explication of the Sphere both Celestial and Material*, etc. (Lond. 1551), an astronomical work, dedicated to queen Mary, in which he compares the Ptolemaic and Copernican systems, and, but with great hesitation, gives the preference to the latter; *The Whetstone of Wit, which is the second part of Arithmetic*, a treatise upon algebra, a subject at that time little known, in which Recorde collects the substance of the best continental writers, and adds his own improvements and discoveries. In the appreciation of the general results derivable from algebraic formulæ, he is far beyond his contemporaries, with the sole exception of Vieta (q.v.). Recorde is regarded as the inventor of the symbol (=) for equality, and of the mode of extracting the square root of compound quantities. Recorde's talents seem to have been as varied as profound, for, besides his mathematical pre-eminence, he was considered to be a skillful doctor, an able lawyer, and a philologist of mean ability.

RECORDER is a judge of a city or borough court of quarter sessions, being a barrister of not less than five years' standing. He is appointed by the home secretary, and the salary is paid by the city or borough out of the borough fund. His duties are the same as what are usually discharged by courts of quarter sessions, and are confined chiefly to the trial of prisoners who have been committed by justices of the peace for trial during each quarter of a year. The recorder is not prohibited from practising at the bar, and he is almost invariably a counsel in active practice. The salary is generally small, but, nevertheless, the office is in great request among members of the English bar. There is no such office in Scotland, but the sheriff discharges similar duties.

RECORDER, the name of a musical instrument formerly in use in this country, somewhat like a flageolet, but with the lower part wider than the upper, and a mouth-piece resembling the beak of a bird. Its pitch was an octave higher than the flute, and it had a pleasing tone, hence Milton speaks of

The Dorian mood
Of flutes and soft recorders.

RECORDS, PUBLIC (Lat. *recordari*, to remember), contemporary authenticated statements of the proceedings of the legislature, and the judgments of those higher courts of law which are distinguished as courts of record. It has been a subject of much discussion what constitutes a record, and in a looser sense the term record has sometimes been applied to any public document preserved in a recognized repository. No country is so rich in public records as England. A committee of the house of commons, in 1837, described the public records of England as comprised under four classes. 1. Independent series of records of territorial surveys at different periods. 2. Series of enrolments, comprising on one roll varieties of distinct entries, classed together according to their formal character. 3. Records of judicial proceedings. 4. Separate documents, as letters, inquisitions, commissions, and privy seals. Act 1 and 2 Vict. c. 94 sets at rest the question what is legally to be held a record, by providing that the word records shall be taken to mean all rolls, records, writs, books, proceedings, decrees, bills, warrants, accounts, papers, and documents, whatsoever belonging to her majesty, or then deposited, or which ought to be deposited, in any of certain places of custody, which are enumerated.

The oldest existing English records are tallies in exchequer, which down to 1834 continued to be used both for receipts and for simple records of matters of account. They consist of wooden rods, marked on one side with notches, to indicate the sum for which the tally was an acknowledgment; while on the two other sides were written the amount, the name of the payer, and the date of the transaction; and the tally being divided longitudinally, the one half was preserved in exchequer, and the other given to the person who had paid the money. This rude contrivance, which came down to us from Anglo-Saxon times, was an effectual safeguard against forgery. Parchment is the material on which the greater portion of the records are written; the skins being, in some cases, as in the rolls of the exchequer and common law courts, attached at the top bookways; in other cases, as the chancery and wardrobe, sewed consecutively. Some records are in the form of books, as *Domesday*; others are filed—i.e., each document is pierced with a string or gut passed through it, the whole being fastened together in bundles. A few records are written on paper. The early parliamentary records and statutes are principally in Norman-French, which continued in partial use till the time of Henry V.; all the other great series of records, except those of parliament, are in Latin down to the reign of George II., or later, except during the commonwealth, when English was substituted.

Public records, which can be traced in germ before the conquest, gradually expanded under the Norman and Plantagenet kings. They enabled the subject to defend and maintain those feudal rights and privileges which were gradually trenching on royal prerogative, and to protect himself from arbitrary exactions; while to the king they furnished precedents which could not be questioned for his calls of military service and taxation.

The various courts being the king's courts, and following the sovereign from place to place, their earliest receptacles were the royal palaces in different parts of England; but when the higher courts were permanently established at Westminster, "treasuries," or places of custody for the records of the different courts, were appointed there. A portion of the public records were, as far back as Henry III.'s reign, deposited in the tower of London and New Temple; and in the reign of Edward III. the tower had become a permanent treasury. The parliamentary committee of 1837 enumerated among the places of deposit a room in the tower over a gunpowder magazine, and contiguous to a steam-engine in daily operation; a chapel at the Rolls, where divine services were performed; underground vaults at Somerset house; damp and dark cellars at Westminster hall; the stables of the late Carlton Ride; and the Chapter-house, Westminster. From the reign of Edward II. downward, the attention of parliament had often been called to the safe custody and arrangement of the records as an object of solicitude. The fullest examination in recent times was made by a committee of the house of commons in 1800, whose report presents far the most comprehensive account of the records in existence. A commission was appointed to go on with the work which the committee had begun, and renewed six times between 1800 and 1831. All the several record commissions directed the commissioners to cause the records to be methodized, regulated and digested, bound and secured, and to have calendars made, and original papers printed; and numerous valuable publications have been issued by the commissioners from time to time. A full investigation into the proceedings of the record commissioners was made by a committee of the house of commons in 1835, since which time annual reports have been issued by the deputy-keeper of records. The most important recent statute regarding the custody and preservation of the records is 1 and 2 Vict. c. 49, which restores to the master of the rolls that custody of the records which he had originally possessed, but which had for a long time become nominal. That officer is empowered to appoint a deputy-keeper of the records, and in conjunction with the treasury, to do all that is requisite in the execution of this service. He makes rules for the management of the office, and fixes what fees may be demanded. He allows copies to be made, which, when certified by the deputy and assistant keepers, and authenticated with the seal of the office, are producible as evidence in courts of law. The home secretary directs from time to time such of the catalogues, calendars, and indexes, and such of the records as he thinks fit, to be printed, and sold at prices fixed by him. The act 1 and 2 Vict. c. 94 contemplates the consolidation of all the records in the large receptacle near Fetter lane, into which, under sir John Romilly, then master of the rolls, they began to be gradually collected from their different scattered depositories.

Our limits will not allow us to enumerate more than a very few even of the more important classes of records. One class consists of the various territorial surveys, beginning with *Domesday* (q. v.), and including, among others, the *Rotuli Hundredorum*, *Extenta Muncerii*, *Testa de Nevill*, *Pope Nicholas's Taxation*, *Henry VIII.'s Survey*, and the *Survey of the Commonwealth*. Another extensive class belong to the *Exchequer*, including the *Pope Roll*, or great roll of the exchequer, beginning with the second year of Henry II., containing the yearly accounts of the revenues of the crown, certain and casual; the *Memoranda* and *Originalia* rolls, records of *First-fruits and Tenths*, records of the *Court of Augmentations*, instituted to decide questions regarding possessions belonging to the crown, on the dissolution of the monasteries, and *Placita*, or records of pleadings and judgments. The *Rotuli Curie Regis* contain the record of the proceedings in the ancient supreme court of law; and there are numerous clauses of records of the proceedings in all the various courts of common law and in the court of chancery. The record of *Fines and Recoveries* is an unbroken record of the transfer of lands from 25 Henry II. down to 1833, when this species of conveyance was abolished. The *Charter Rolls* are records of charters, of grants of privileges to religious houses, towns, and corporations, and creations of nobility from 11 Edward II. to Edward IV. The *Patent Rolls* are enrollments of instruments written on open (*patentes*) sheets of parchment, having pendent from them the great seal, addressed to the lieges in general. The *Close Rolls* are records of such letters under the great seal as were dispatched closed or sealed up—royal mandates to particular persons for particular purposes, and not intended for public inspection. The *Liberate Rolls* contain writs issued out of chancery, ordering the payment of money from the treasury. The *Fine Rolls* contain accounts or fines paid to the king for license to alienate lands, freedom from knight-service, passing or renewal of charters, wardships, safe-conduct, pardons, etc. The *French Rolls*, *Norman Rolls*, and *Gascon Rolls* relate to the affairs of France, Normandy, and Gascony, when held by the English; and the *Rotuli Scotie* to transactions with Scotland. An important class of the records are those connected with parliament, including *Statute Rolls*, *Parliament Rolls*, *Records of Parliament*, and *Statutes* from 1485 to the present time, with the *Journals of the Lords and Commons* from Henry VIII. to the present time, and the *Writs of Summonses* and returns to parliament.

The *state papers* originally sprung from the privy council and chancery, and include the correspondence of the privy council, secretaries of state, and other public departments, with miscellaneous domestic papers from the time of Henry VIII. to George II., a mass of correspondence with foreign powers, and an extensive collection relating to ecclesiastical affairs at and after the reformation. Since 1855 the state paper office has become a part of the public record office, and been placed under the control of the master of the rolls. Much has been done in the way of calendaring and arranging the contents of this valuable repository, and several volumes of calendars of state papers are being issued yearly to the public.

By the regulations established by the master of the rolls, July 5, 1858, persons desirous of consulting the public records, including state papers, for a literary purpose, have to apply in writing to the deputy-keeper, stating the objects of their search, which, if necessary, may be more fully explained at a personal interview. If the explanation be satisfactory, a permission is issued to inspect and make extracts without payment of fees.

Scotland.—The public records of Scotland were undoubtedly numerous and multifarious as early as 1282; but the more ancient of them were lost by shipwreck in the reign of Edward I. of England. The control of the records has from very early times been intrusted to the clerk register, or lord clerk register, one of the high officers of state, who had a seat in the Scottish parliament, to whom, and his deputies and other officers appointed by him, it was assigned to superintend both their formation and their custody. The earliest records of Scotland were in the inconvenient form of rolls, but in the reign of David II. the practice was introduced of writing them in books. By an act of 1463, the king's rolls and registers were appointed to be put in books; but the accounts in the exchequer continued, nevertheless, to be kept in rolls till the passing of another act in 1672, appointing them to be written in books. Prior to the reign of Charles II. the public records were deposited, under care of the clerk register, in the Laigh parliament house, now part of the advocates' library; and shortly before the union, the whole records were transferred to that depository, where they continued till the erection of the large building called the general register house, which was completed in 1787, and has recently been added to. The register house serves the purpose of preserving and making available the national muniments, as well as accommodating the whole offices of record connected with the supreme court. The lord clerk register and his depute have now merely the *custody* of the records, their preparation being intrusted to another class of officers.

Under the Scottish records are included the acts of parliament and of privy council, and the records of all the various courts of justice; also the records of the great seal, privy seal, and signet. An important class of records are the *Retours of Services*. A service is by the law of Scotland necessary to transmit a right to real property to the heir from his ancestor. At present, this service consists of the decision of the sheriff of the county or the sheriff of chancery; but the form in use till 1847 was by retour, a writing which contained the verdict of a jury returned in answer to a brieve from chancery for finding the heir at the death of his ancestor. The register of retours is not extant further back than 1547.

The registers connected with the transmission of heritable rights are even more important. After several unsuccessful attempts to introduce a system of registration, the great branch of the public records known as the *Register of Sasines* was established by act 1617, c. 16. By the system then introduced, which has since been continued with modifications in detail, all instruments requisite to the transmission of real property must be put on record for publication. Besides the principal register in Edinburgh, there are district registers, and any instrument may be recorded either in the general or district register. Volumes are issued from the general register house to the district recorders of sasines, which, when filled, are returned to the general register house. By this means the title to real property can be ascertained with certainty and precision, and may, if necessary, be traced back two centuries and a half. It is also obligatory to record in separate registers all instruments necessary for the constitution, transmission, and extinction of voluntary incumbrances. See REGISTRATION OF DEEDS AND WRITS. This system, while confirming the credit of the proprietor, also operates in favor of the security of creditors. There is a special *Register of Entails*, in which, in terms of act 1685, c. 22, deeds of entail must be recorded at the sight of the court of session. The object of registration in all these cases is *publication*; but charters by subjects, dispositions, bonds, contracts, and other probative writs may, under act 1698, c. 4, be recorded in the *Register of Deeds for preservation*. A third object of registration is *execution*. Every deed constituting a personal claim of debt, or an obligation to perform some lawful prestation, if intended to be made the subject of personal diligence for payment or performance, and must be registered previously to execution being issued on it. Some volumes of calendars of state papers relating to Scotland have been issued to the public.

Ireland.—Many of the records perished during the wars prior to the final reduction of Ireland, and those which survived these commotions were long exposed to mutilation and destruction from the unsatisfactory arrangements for their custody. A commission was appointed in 1810 for the preservation and arrangement of the Irish records, whose

labors, conducted with considerable success, were terminated by the revocation of the commission in 1830. In 1847 commissioners were again appointed to investigate the state of the records, in consequence of whose labors a bill for their safe custody was prepared, but afterward abandoned. There is no general place of custody for the records of Ireland, which are scattered in different repositories in Dublin. Several volumes of calendars from the Irish *patent* and *close* rolls have been published under the direction of the master of the rolls.

RECOUPMENT, the right of a defendant to demand damages in the same action of the plaintiff, because the latter has violated some legal duty in the case, or has not fulfilled some cross-obligation of the contract. Formerly it denoted a diminution of the plaintiff's claim on account of partial or entire payment; whereas in modern use it signifies a reduction of damages. For the purpose of reducing the damages, the defendant may show any violation of the contract by the plaintiff which tends to make the consideration less valuable. The defendant must, however, bring an independent action for immediate or indirect damages other than as above specified. The damages recouped may be for a tort; but the tort must be a breach of the contract, and malice will not be taken into account in estimating the damages. The defendant cannot have judgment for the excess of the damages recouped over the plaintiff's claim: and he cannot bring suit to recover such excess. Unless there are statutes to the contrary, the defendant may bring an independent suit, or plead his cross-demand in recoupment, as he chooses: and he may plead in recoupment the same damages upon which he has already brought suit. He may, however, be compelled to say upon which remedy he will rely. Under the New York codes and the other codes resembling it, the general issue being abolished, the defendant must plead his defense, whether to the whole claim or simply in reduction of damages. It has been held in New York, Arkansas, and elsewhere, that recoupment does not apply to real estate, and that the defendant, in a suit against him for the purchase money, cannot recoup because his title has partially failed. But it seems that he has such right after eviction. Failure of title is not the same thing as failure of consideration. The consideration of a deed with covenants fails only when the covenantee is damaged on the covenants, and he can recoup after eviction. But it has been held that the vendee may recoup on the covenants where the consideration has failed.

RECOVERY, in English law, was a term much used in reference to estates tail, though it is also a general term denoting the decision of a court in favor of a party claiming lands or goods. A feigned recovery was an imitation of a similar proceeding, and was a device invented to break an English entail. An estate tail was an estate given to A and the heirs of his body, and at first it was enacted by a statute *de donis*, under Edward I., that A could not sell or alienate the estate, so as to prevent the heirs of his body acquiring the benefit of it. But the lawyers invented a sham action and judgment, called a recovery, by which the issue were barred from all rights. The fines and recoveries act abolished that form, and substituted for it a disentailing deed, which, when executed by the tenant in tail, has the same effect.

RECRUITING. Formerly, the task of raising recruits for the army was intrusted to the colonels of regiments, who employed civilian agents and others to persuade young men to join their standards; these agents often resorting to very illegal methods to entrap recruits. Subsequently, the duty was assigned to several recruiting corps, each known by the name of its commanding officer; but under this system, so many irregularities, and such difference of practice arose, that in 1802, for purposes of uniformity, economy, and proper control, it was decided to place the whole recruiting under the immediate direction of the adjt. gen. For this purpose, the country was divided into recruiting districts. At the head of each district was placed an inspecting field-officer, with the duty of superintending all recruiting parties in his district, and of approving the recruits brought. At the district headquarters there was a paymaster, responsible for all the financial concerns, and a medical officer, who examined the recruits in point of health and physical fitness.

Recruiting parties used to consist of old sergeants, who sought by every means to induce young men to enter the army; they frequented fairs, wakes, and country gatherings, endeavoring by beat of drum, smart uniforms, well-fed personal appearance, and persuasion—not always too truthful—to convince the rustics of the advantages of the queen's service; advantages which really existed, though not always to the extent depicted. The adoption in 1872-73 of the system of regimental localization changed all this. The United Kingdom is divided into 66 sub-districts, at the head of each of which is a col., who commands the brigade depot, and the auxiliary and reserve forces of his sub-district. He also controls the recruiting within his command, primarily, for the regiments composing the brigade; and secondly, for the rest of the army. To preserve uniformity of action, the colonels report on recruiting matters to the inspector-general of recruiting, an official on the staff at the war office. On a would-be recruit presenting himself, the recruiter must ask him if he already belong to the militia; if not, and he appear physically eligible, he is given a shilling, after which, should he abscond, he becomes a deserter. The sergeant must then give the recruit 24 hours for consideration; afterward, but within 96 hours from first enlistment, he must take him before a magistrate, when, if the recruit declare that he voluntarily enlists, the justice reads to him the

articles of war relative to desertion, and puts the questions detailed in the attestation. This done, the oath of allegiance is administered, and the man becomes definitely a soldier, receiving his free kit and bounty. The recruit may avow his dissent before the magistrate, when he must be forthwith discharged on returning the shilling, and paying twenty shillings as "smart" for the trouble he has given. False declarations as to age, previous service, health, etc., involve the recruit in various penalties. About 18,000 recruits are raised annually in time of peace for the British army; but a larger number will be necessary, as enlistment for short service with the colors becomes more the rule.

Recruiting for the navy is treated under **MANNING THE NAVY**.

RECTIFYING is a process applied to alcohol after its distillation, to remove certain impurities which come over with it from the still. These, in part, consist of essential oils; and in order to effect their removal, caustic potash is added in sufficient proportion to saponify the oil present; water is also contained in the first distillation, and to remove this, and to assist in removing the oily matters, common pearl-ash is added. Technically, the former of these is called *gray salts*, and the latter *white salts*; and about four pounds of each are added to every 700 gallons of spirit, and well agitated, so as to combine with the oil and water. The spirit is then distilled again, and comes over much more pure, the alkaline salts, and the matters which have been combined with them, being left behind in the still. This is usually repeated two or three times, the quantity of the salts being diminished to one-half in the second, and proportionately decreased in the succeeding distillations. The rectifier is not only a purifier of the alcohol produced by the distiller, but he often gives it a distinctive character: by adding flavoring materials to it, he makes it into gin, brandy, etc. Thus, in order to convert the spirit into London gin, juniper berries and coriander seeds are added previous to the last rectification. Ceanothic ether and other things give the flavor of brandy. This part of the operation is very much varied by the taste and skill of the rectifier.

RECTOR (Lat. *vector*, a ruler), the title of several classes of clerical and collegiate officials, some of which are referred to under their respective heads. As regards clerical rectors, the title, in its most ordinary English use, is applied to the clergyman who holds complete and independent charge of a parish. This use, however, is a departure from the canonical signification of the title, which meant rather a clergyman who was appointed to govern a parish where the chief parochial jurisdiction was vested in a religious corporation or in some non-resident dignitary. In certain of the monastic orders, the name rector is given to the heads of convents, as it is also given to the heads of universities, colleges, seminaries, and similar educational corporate institutions.

RECTUM, DISEASES OF. The terminal portion of the intestinal canal, named from its comparatively straight course, the rectum, is the seat of various affections requiring medical or surgical assistance. Some of these affections, as piles, prolapsus ani, and hemorrhage from the rectum, have already been considered. Among the other diseases of the rectum of sufficient importance to claim notice in these pages are—

1. *Stricture of the rectum*, which may be either spasmodic or permanent. *Spasmodic stricture* is comparatively rare. *Permanent stricture* may be either of a simple or malignant nature. *Simple stricture* consists in a thickening and induration of the mucous coat of the rectum, so as to form a ring encroaching on the caliber of the tube. It is situated about two or three inches from the anus, and the contraction is so great and unyielding that it is often difficult to pass a finger through it. The symptoms are constipation and great pain, and a straining in evacuating the feces, which are passed in a narrow, flattened, or worm-like form, which is very significant of the nature of the case. In an advanced stage of the disease, diarrhoea and prolapsus often supervene. However great may be the constipation, strong irritant purgatives must be altogether avoided. Soft and unirritating evacuations may be procured by such medicines as the confection of senna combined with sulphur (see **PILES**), or injections of castor-oil or of tepid water. The diet should be regulated so as to assist the action of the medicines. Nutritious soups are serviceable, since, at the same time, they support the strength, and leave little matter to be excreted. When much local irritation is present, it may be relieved by the hip-bath and by sedative injections; till it is subdued surgical interference would do more harm than good. A bougie capable of being passed with moderate pressure through the stricture should be inserted in the gut every third or fourth day, and should be allowed to remain for about a quarter of an hour; and its size should be gradually increased. Nothing is gained by the forcible passage of large bougies. The cure is to be effected by pressure so applied as to produce absorption, not by mere mechanical dilatation. *Malignant stricture*—most commonly due to the scirrhus, but sometimes to the epithelial form of cancer—is by no means a very rare affection, and is more common in the female than the male sex. Until ulceration sets in, the symptoms are like those of simple stricture, only exaggerated in degree; but afterward there is a discharge of fetid muco-purulent matter streaked with blood. In this disease, the treatment can be only palliative unless the surgeon resort to the formation of an artificial anus in the loins as a last resource.

2. *Spasm of the sphincter ani* muscle is characterized by extreme pain in the region of the anus, especially when an attempt is made to evacuate the bowels. The muscle contracts so firmly that the surgeon cannot easily introduce the finger into the rectum. The spasm may be caused by piles, by fissure of the anus, by ulceration of the rectum, and

sometimes apparently by mere constipation. It is often relieved by the application of the belladonna ointment of the British pharmacopœia.

3. *Neuralgia of the rectum*, known also as *proctalgia*, is a common disorder, and is especially prone to attack children and gouty persons. It is usually relieved by the judicious use of aperient medicines.

4. *Congestion*, sometimes proceeding to *inflammation*, is not uncommon in the rectum. The congestion occasions a sense of weight and fullness in and about the rectum, together with a variety of other symptoms. Amongst the causes of this affection are stone in the bladder, stricture of the urethra, an enlarged prostate gland, the presence of thread-worms, the abuse of irritating purgatives, exposure to cold draughts in the water-closet, etc.; and there can be no doubt that sedentary habits strongly favor the predisposition to this affection. The great object of treatment is to relieve the overloaded vessels of the rectum. The bowels should be freely opened with castor-oil, leeches should be applied to the verge of the anus, and after their removal a warm hip-bath is advisable.

5. *Pruritus perianalis*, or *itching of the anus*, is a very common and extremely troublesome affection. Sometimes it depends on the presence of thread-worms or of old piles, while in other cases it is one of the manifestations of the skin-disease known as *prurigo* (q.v.). The treatment must depend upon the exciting cause.

6. *Fissure of the anus* is a small crack which gives intense pain during the passage of the feces, and often persisting for several hours. Free purgatives, and the application of astringent lotions or ointments (as tannin lotion or ointment of galls) should be tried; and if they fail, partial division of the sphincter muscle must be resorted to—an operation easily performed, and certain to give relief.

7. *Fistula in ano* signifies a fistulous or pipe-like track by the side of the *sphincter ani* muscle. It may occur as a *complete fistula*, which has an external opening near the anus, and an internal opening into the bowel; or as a *blind external fistula*, which has no actual opening into the bowel, although it extends to its outer coat; or as a *blind internal fistula*, in which the preceding conditions are reversed. A sketch of the mode of treatment is given in the article **FISTULA**.

For a detailed description of these diseases of the rectum, and for information on many other less important affections of this part of the body, the reader is referred to Bushe's *Treatise on the Rectum*, and to the more recent works of Mr. Ashton and Mr. Henry Smith on the same subject.

RECU'SANTS, in English law, are persons who refuse or neglect to attend at the worship of the established church on Sundays and other days appointed for the purpose. The offense as a legal one may be held to date from 1 Elizabeth, c. 2; but there were four classes punishable under the statutes against recusancy—simple "recusants;" "recusants convict," who absented themselves after conviction; "popish recusants," who absented themselves because of their being Roman Catholics; and "popish recusants convict," who absented themselves after conviction. It was against the last two classes that the statutes were mainly directed. In addition to the general penalties of recusancy, the popish recusants, for willfully hearing mass, forfeited 100 marks (£66, 13s. 4d.); and for saying mass, 200 marks, or £133, 6s. 8d., in addition (in both cases) to a year's imprisonment. They were disabled, unless they renounced popery, from inheriting, purchasing, or otherwise acquiring lands; and they could not keep or teach schools under pain of perpetual imprisonment. Popish recusants convict could not hold any public office; could not keep arms in their houses; could not appear within ten miles of London under penalty of £100; could not travel above five miles from home without license; could not bring any action at law or equity; could not have baptism, marriage, or burial performed, except by an Anglican minister; all under penalties of forfeiture and imprisonment. Protestant dissenting recusants were relieved from the penalties of recusation by the toleration act of 1 Will. and Mary, c. 18. Catholics were partially relieved in the year 1791, and completely by the emancipation act of 1829.

REDAN is the simplest work in field-fortification. It consists of two parapets whose faces join in forming a salient angle toward the enemy, like a letter V, in which the apex is to the front. Regarded by itself, the redan is a work of very little strength since there is no flanking fire to protect its faces, and nothing to prevent an enemy from forcing an entrance at the gorge; but redans are useful in many positions, and the rapidity with which they may be constructed, render them favorites with engineers and generals. A row of redans along an exposed front of an army adds much to its strength, the troops behind protecting the gorge, and the redans flanking each other. It forms an excellent defense for a bridge-head, the gorge being covered by the river. Redans figured largely in Wellington's works for defending Lisbon in 1810. The redan of Sebastopol in 1855 was the principal point of the English attack, and the scene of two bloody repulses by the Russians in June and September.

REDBREAST, *Erythra rubecula*, or *Sylvia rubecula*, a bird of the family *sylviadae*, familiar to every one in the British islands and throughout most parts of Europe—a universal favorite, from the readiness with which it approaches or enters human habitations, its lively manners, its aspect of pert curiosity, the frequency with which its song is heard in autumn and winter, and the strange mixture of shyness and audacity which its behavior displays. It is generally known throughout Britain by the endearing name

of *robin redbreast*, or more briefly *robin*, and has many similar appellations in continental Europe, significant of the kindly regard entertained for it, which is everywhere such that children early begin to distinguish it from all other birds as their peculiar favorite. Its utmost length is about 5½ in., but it is of a rounder and fuller form than many of the *syliade*, the slenderness of its legs rather strikingly contrasting with the form of the body. The wings are rather short, the fifth quill the longest. The tail is scarcely forked. The bill is rather broad and depressed at the base, narrower and slightly compressed at the point, the upper mandible bent down and notched. The general color is olive-brown, and the reddish-orange breast is a conspicuous characteristic, particularly of the male.—The redbreast is a native not only of Europe, but of the western temperate parts of Asia and of the n. of Africa. In the most northern parts of Europe it does not appear; and in many northern regions it may be regarded as a bird of passage; but, contrary to the ordinary rule as to birds of passage, it never congregates in flocks; it is always seen either solitary or in pairs. The attachment of pairs seems to extend beyond the mere breeding season, and, indeed, throughout their lives, and to be stronger than in most birds. The breeding season is early in spring. The nest is made of moss, dead leaves, and dried grass, lined with hair, often placed a little above the ground in a bush or among ivy on a wall; the eggs 5 to 7 in number, white, spotted with pale reddish-brown; but many are the stories of the curious situations in which the redbreast has built its nest, in close proximity to houses and workshops, regardless of the presence of human beings, and of the noise of hammers and wheels. In winter, the redbreast seeks the neighborhood of human habitations more than in summer, and becomes more bold and familiar. Its food ordinarily consists of worms, insects, and berries; and when it becomes a pensioner at any door or window, which it very readily does, it shows a particular relish for small scraps of meat. Its song is sweet and plaintive, but weak, not much noticed amidst the many voices of summer, but often heard in the quietness of autumn, and even of winter, throughout which it is continued whenever the weather is good.

In America, the name redbreast is often given to the blue bird (q. v.).

RED COLORS. Those used by painters consist of certain chemical compounds, natural or artificial. Thus, the red pigment called Armenian bole, is either the ochreous earth known by that name, imported from Armenia, Tuscany, and other places, or else, as is most frequently the case, it is a composition of whiting, red oxide of iron, and red ocher. Vermilion is a sulphuret of mercury produced either naturally or artificially. Chrome-red is made by boiling carbonate of lead with chromate of potash in excess, until it assumes a red color, after which it is washed in pure water, and dried in the shade. Indian red is a native product of Persia, being found in the neighborhood of Ormuz. It is imitated by calcining colcothar with red ocher. Light-red is made by calcining yellow ocher, and this can be converted into flesh-color by a due admixture of white. A bright orange-red, sometimes called sandix, is made by calcining white-lead. Minium, or red-lead, is a very distinct red color, requiring but little preparation; it is much used. Red ocher is extensively found in the Mendip hills, and is an oxide of iron; with clay, it forms a brownish-red paint. There are several other red colors, but these are the principal ones employed by painters.

RED CRAG, a deposit of quartz sand intermixed with rolled and comminuted shells, of a deep ferruginous or ochreous color, which occurs in Suffolk, and belongs to the pleiocene strata (q. v.).

RED DEER. See STAG.

REDDEN, LAURA CATHERINE WALLER. See SEARING.

REDDING, CYRUS, 1785-1806; b. Cornwall, England; at an early age adopted journalism as a profession; edited the *Pilot* of London and the *Chronicle* of Plymouth, and for three years conducted *Galignani's Messenger* at Paris, 1815-18. From that time until his death he was editor of several English papers of liberal politics, and contributed to many others. He wrote many books, the best known of which are *Reminiscences of Thomas Campbell* (with whom he had been joined as editor of the *New Monthly Magazine*); *Fifty Years' Recollections* (1858); and *Past Celebrities whom I Have Known* (1865).

REDDITCH, a busy manufacturing t. of Worcestershire, stands on an acclivity 12½ m. s.s.w. of Birmingham, with which it is connected by rail. Needles, pins, fish-hooks, and fishing-tackle are made extensively. Pop. '71. 6,135.

REDDLE, RADDLE, OR RED-CHALK, an ochery, red-clay iron ore, which is chiefly imported from the continent, where it is found in Hessa, Thuringia, Upper Lusatia, Silesia, and Salzburg. It is found in small quantities in England, in the neighborhood of Rotherham, and at Wastwater, Cumberland. The English differs somewhat in quality from the foreign, and is chiefly used in polishing spectacle glasses. Of that from abroad, the finest quality is used for drawing on paper; the inferior sorts are used by carpenters and others for marking with; and the commonest is used for marking sheep. It occurs generally in thin beds in clay-slate.

REDEMPTION, in law, the right of redeeming property which has been pledged to secure a debt. The equity of redemption is the name given to this right, and is commonly used in reference to mortgages of real estate, the mortgagor, after executing a

deed of mortgage, having a right at any time to pay off the debt and redeem or get back his property, unless he has been foreclosed by the creditor by a legal proceeding, the object of which is to sell the property to pay the debt. In Scotland the equity of redemption is more usually called a reversion.

REDEMPTIONISTS, one of the names of an order of monks devoted to the redemption of Christian captives from slavery. They are more frequently called Trinitarians (q. v.).

REDEMPTORISTS, called also **LIGUORIANS**, a congregation of priests founded by St. Alfonso Liguori (q. v.).

REDEYE, or **RUDD**, *Leuciscus erythrophthalmus* (see **LEUCISCUS**), a fish of the family *cyprinidae*, common in lakes, slow rivers, fens, etc., in many parts of Europe and in England. It much resembles its congener the roach (q. v.), but is shorter and deeper. It is a richly-colored fish. The name rudd refers to the color of the fish, the name redeye to that of its iris. The redeye is better eating than the roach. It is readily caught by a baited hook. It sometimes attains a weight of 2 lbs.

REDFIELD, **ISAAC FLETCHER**, LL.D., 1804-76; b. Vt.; graduated at Dartmouth college; studied law and practiced in Vermont, and later in Boston. He became a member of the Vermont supreme court in 1835, and chief-justice in 1852. From 1857 to 1861 he was professor of medical jurisprudence at Dartmouth college. In 1867 he was a member of the commission to settle disputed claims between this country and Great Britain. He was editor of the Philadelphia *Law Register*; edited an edition of *Greenleaf on Evidence*; and is the author of *Law of Railways*, *Law of Wills*, *Law of Carriers*, and *Leading American Cases*—all legal treatises of the highest practical value.

REDFIELD, **WILLIAM C.**, 1789-1857; b. Conn.; removed to New York in 1825. He studied steam navigation, investigated the causes of steam explosions, and in a number of pamphlets urged the necessity of a thorough system of inspection. In 1828 he advocated a system of railroads from the Hudson to the Mississippi. In 1831 he published his *Theory of Storms*. He published many papers on meteorology.

REDGRAVE, **RICHARD**, b. London, 1804; student of art at the Royal academy; exhibited in 1837 a work which met with great success, called "Gulliver on the Farmer's Table." He is a painter of landscapes and *genre* pictures; illustrated Thomson's *Seasons* and Goldsmith's *Deserted Village*; and among his most celebrated works are "Country Cousins," in the South Kensington museum, and "The Sempstress," illustrating Tom Hood's *Song of the Shirt*. In 1857 he became a member of the Royal academy; in 1875 surveyor of her majesty's pictures and inspector-general of art schools, for which he had an original system and course of instruction. He has published works on art and artists; an *Elementary Manual of Color*; and with his brother Samuel, *A Century of Painters of the English School*, with critical notices of their works, 1866.

RED-GUM is the popular name for the papulous disease of the skin known to the physician as *strophulus*. It is a florid eruption, usually occurring in infants before or during their first dentition, and appearing on the most exposed parts, as the face, neck, arms, and hands, from whence it sometimes extends to other portions of the body. It occurs in minute red pimples, irregularly arranged, with occasional red patches, and sometimes a few interspersed vesicles. White pimples, popularly known as *white gum*, are also sometimes intermingled with the red papillae. Strophulus is almost always an acute disease, seldom lasting more than a month. It is almost always an innocent complaint, and often occurs without any marked disturbance of the general health. In severe cases the pimples cause a sensation of heat and itchiness, especially if the child is kept too warm, and slight febrile symptoms manifest themselves. Among the probable causes of this disease are the irritation caused by rough flannel next the skin, want of cleanliness of the skin—especially in relation to the child's excretions—the general disturbance of the system excited by teething, etc. Very little is required in the way of treatment further than to remove any obvious cause of the affection. Cold applications should be carefully avoided, lest they should translate the cutaneous irritation to some important internal organ. In the event of such a translation the child should be placed in a hot bath, and mustard poultices, or hot moist cloths sprinkled with turpentine, should be applied over the arms and chest.

RED HAND, in heraldry. A sinister hand erect, open, and coupé or, the wrist gules, being the arms of the province of Ulster, was granted to the baronets of England and of Ireland as their distinguishing badge on the institution of that order in 1611, and is borne by the baronets of Great Britain and of the United Kingdom. It is assumed into the armorial coat, and may be borne upon a canton, or on an escutcheon, which may be placed either in the middle chief or in the fess point, so as least to interfere with the charges composing the family arms.

RED-HOT SHOT are cannon-balls heated to redness, and fired from cannon at shipping, magazines, wooden buildings, etc., to combine destruction by fire with battering by concussion. In the great bombardment of Gibraltar on Sept. 13 and 14, 1782, red hot shot was used with great effect by the defenders under the governor, gen. Elphinstone, the attacking squadron being completely silenced, and a large number of ships set on fire.

LEVI, FRANCESCO, 1626-98; b. Arezzo; physician to the grand duke Ferdinand II. of Tuscany; of distinguished reputation as a medical practitioner, naturalist, scholar, and poet. He assisted in compiling the dictionary of the academy Della Crusca. He was the first promulgator of the germ theory. In 1685 he published *Dacco in Toscana*, considered the best of his poems. He wrote the lives of Dante and Petrarch. Among the most important of his scientific works are *Osservazioni Intorno alle Vipere* (1664); and *Esperienze Intorno alla Generazione Degli Insetti* (1668).

REDING, ALOYS VON, the famous champion of Swiss independence, was b. in 1755, in the canton of Schwyz. After serving in Spain, he returned to Switzerland in 1788. As capt. gen. of the canton of Schwyz, he repulsed the French republicans, May 2, 1798, at Morgarten. After the formation of the Helvetic republic, Reding was one of those who eagerly worked for the restitution of the old federal constitution. In 1802 he founded in the eastern parts of Switzerland a league, with the intention of overthrowing the central government. When after the departure of the French almost all the cautious declared themselves against the Helvetic government, Reding called a general diet at Schwyz, which assembled Sep. 27, 1802, and occupied itself with the formation of a new independent constitution. Reding went to Paris, in order to win over the first consul to the proposed change. In spite of all his endeavors, however, he failed to succeed. The disarmament of the Swiss by a French army, and the acceptance of the act of mediation, put an end to his hopes and to his political activity. In 1803 he officiated still as landamman, or chief magistrate of Schwyz; but after that retired into private life till 1809, when he was invested once more with the same dignity. In 1813 Reding conducted the negotiations with the allies in regard to the neutrality of Switzerland. He died in Feb., 1818, leaving the character of an honest man, whose political career might have been more successful had he not been wanting in firmness of mind and of character.

RED JACKET (SA-CO-YE-WAT-HA), 1752-1830, b. N. Y.; chief of the Seneca Indians. During the revolution he was a runner for the British officers on the frontier. In 1784, at a council held at fort Stanwix, he opposed with great eloquence a proposed treaty between the United States and the Sioux for the cession of the lands of the latter tribe. Some years later he had an interview with Washington, who gave him a silver medal. In 1807 he informed the Indian agent of a plot by Tecumseh to induce the Senecas to join an alliance against the United States. In 1812 he rendered considerable services to the Americans. During the latter part of his life he was a confirmed drunkard. He was an eloquent orator, and possessed great influence with his tribe, whom he endeavored to inspire with a contempt for everything English.

RED-LIQUOR, a chemical compound much used by dyers. It is a crude acetate of alumina, and is commonly prepared in dyeing establishments by dissolving a quantity of alum in boiling water, and separately dissolving, also in hot water, three-fourths as much acetate of lead. The two solutions are next mingled together; and after settling, the clear fluid, which is the red-liquor, is poured off. The sediment is sulphate of lead.

REDOUBT is a small fort of varying shape, constructed for a temporary purpose, and usually without flanking defenses. The term is vague in its acceptation, being applied equally to detached posts and to a strong position within another fortress. Redoubts as a general rule do not exceed 40 yards square, with 4 guns and a garrison of 320 men. Redoubts are made square, pentagonal, and even circular. Each redoubt has parapet, ditch, scarps, banquette, etc., as in regular fortification; but it is commonly rather roughly constructed, haste and unprofessional labor precluding mathematical accuracy. The entrance may be by a cutting through the parapet, the cutting being covered within by a traverse; or preferably, by an excavated gallery leading into the ditch, and thence by a ramp through the counterscarp. For the sake of flanking the ditch, and preventing an assaulting party from forming in it, caponnières of timber, loopholed, are sometimes formed; or, if the soil be stiff or chalky, a gallery may be cut behind the counterscarp, and loopholed toward the ditch. In some modern redoubts the line of each side is broken to afford flanking defense. Redoubts have the weak feature of not defending their own ditches, and of being approached at their salient angles with comparative impunity. They are therefore not adapted to a protracted defense, but as temporary field works, or in a war of posts, they are often of incalculable importance. Troops whose stability in the open field is doubtful are especially strengthened by redoubts in their line. Redoubts are particularly useful in fortifying the tops of hills, or commanding passes, or where the object is to occupy a hostile territory, or to feel the way gradually through a wooded country.

REDOUT KALÉ, a port on the Black sea coast, in the district Kutais of the Russian lieutenancy of Caucasia, is situated in a marshy region at the mouth of a small river, about 12 m. n. of Poti. It possesses a Russian fortress of considerable strength, fired by the Russians in 1854 to prevent its falling into the hands of the English. Population inconsiderable, though increasing.

REDPATH, JAMES, b. England, 1833; emigrated to this country in 1848. He was the organizer of the Redpath lyceum bureau of Boston; and was long connected with

the New York *Tribune*, which he represented during the land league troubles 1880-81, attracting considerable attention by the violence of his language against the landlords. He was a pronounced abolitionist, and among his writings is a *Life of Captain John Brown* (1860).

RED POLE. See LINNET.

RED RIVER, the lowest western branch of the Mississippi, rises on the eastern border of New Mexico, flows eastward, separating Texas from the Indian territory, thence s.e. through Louisiana, and enters the Mississippi 341 m. from its mouth. It is 2100 m. long, and receives numerous branches, the Washita, Negro, Big and Little Wichita, etc. Near its source, the s. branch runs for 60 m. between perpendicular banks, 600 to 860 ft. high. It is navigable for 8 months of the year to Shreveport. Thirty m. above this place is the great Red river raft, formed of driftwood, which blocks up the river for 60 or 70 miles. Its other important towns are Alexandria and Natchitoches.

RED RIVER (*ante*), the southernmost of the great tributaries of the Mississippi. The peculiar color from which it derives its name is attributed to the red clay of the gypseous formation which constitutes a portion of its bed. It rises in the Panhandle or n.e. section of Texas, in lat. 34° 40' n. and long. 103° 2' w., its source being the fissures of the Llano Estacado or Staked Plain, a barren and rainless tableland about 2,450 ft. above the sea. Following an e. direction it first passes through an immense cañon of some 100 m. in length, owned and occupied by Comanches and Staked Plain Indians, who have effectually resisted all attempts at exploration; then forms the dividing line between Texas and Indian territory, being the entire s. boundary of that territory. At Fulton, Ark., it makes a sudden bend, and for the rest of its course pursues what is in the main a s.e. direction, though with many windings, until it enters the Mississippi about 31° north. Its chief tributary is the Washita river, which it meets some 25 m. above its mouth; the other affluents, like the North Fork, the Big Wichita, etc., are of minor importance. The total length of the Red river is estimated at about 1550 m., and the area drained by it at about 97,000 sq. m., a large proportion of which area is remarkable for its fertility. Its broadest part (2,700 ft.) is just below where it issues from the cañon already mentioned, and for more than 100 m. thereafter it flows in a very wide and shallow channel, and then gradually contracts, while its bed deepens, until at its confluence with the Big Wichita river, 400 m. from its source, it measures only 600 feet. Thereafter its width is rarely more than 800 ft. until it nears its mouth, where it stretches to some 1800 feet. Its greatest depth is about 50 feet. In the upper part of its course, where the channel is wide, it is never more than 6 or 8 ft. deep even in the flood times, which are frequent. The fall of the river from its source to its meeting with the Big Wichita is very rapid, being nearly 1500 ft., thence to Fulton about 800 ft., and from Fulton to its mouth, where it is 50 ft. above the gulf level, only 188 feet. During the low water seasons (from June or July until December) the mouth of the river cannot be entered by boats of more than 2 ft. draught. For steamers of light weight it is navigable as far as Shreveport, La., for seven or eight months in the year, but as far as Fulton for only three or four months. For smaller vessels it is navigable at high water for about 1250 m. above its mouth. Just below Shreveport, navigation was formerly impeded by the great raft, an immense collection of timber and driftwood extending thence as high up as Great Echeore, a distance of 15 miles. The U. S. government in 1833 undertook the removal of this obstruction, and after various abortive efforts lieut. Woodruff in Nov., 1873, succeeded in cutting through the raft a navigable channel, which can be kept open at slight annual expense.

RED RIVER, a parish in n.w. Louisiana, on both sides of Red river, and e. of Bayou Pierre; 400 sq. m.; pop. '80, 8,573—8,540 of American birth, 6,067 colored. The surface is low, swampy but fertile; covered in great part by forests of pine, oak, and cypress; cotton and corn are the staples. Co. seat, Coushatta Chute.

RED RIVER, a co. in n.e. Texas, drained by Red river, its n. boundary, and by Sulphur fork; intersected by the Texas and Pacific railroad; 1600 sq. m.; pop. '80, 17,194—17,056 of American birth, 6,287 colored. The surface is rolling and fertile; corn, cotton, pork, and cattle are the staples. Co. seat, Clarksville.

RED RIVER OF THE NORTH rises in a cluster of lakes in w. Minnesota, U.S., near the sources of the Mississippi, and runs n., separating Minnesota from Dakota, into the British possessions, and empties in lake Winnipeg, about 500 m. from its source, watering a beautiful country, and receiving numerous branches, the chief of which are the Cheyenne, the Pembina, and the Assiniboine.

RED RIVER SETTLEMENT. See MANTOBA, *ante*.

RED ROOT, *Ceanothus*, a genus of plants of the natural order *rhamnaceæ*, consisting of deciduous shrubs with simple alternate leaves and large red roots, whence their common name. The common RED ROOT of North America (*C. Americanus*), which abounds from Canada to Florida, is a shrub of 2 to 4 ft. high, with beautiful thyrsi of numerous small white flowers. It is sometimes called *New Jersey Tea*, because an infusion of the dried leaves is occasionally used as tea, and was so especially during the American war of independence. The plant is also used for dyeing wool of a cinnamon color. A strong infusion of the leaves has been found useful in aphthous affections, in the sore throat of

scarlet fever, and in dysentery.—A number of species are found in different parts of North America, some of them very beautiful, especially *C. azureus*, a Mexican shrub, with elongated thyrsi of brilliant blue flowers. Some of the species grow very well in Britain; the Mexican ones require protection from frost in winter.

REDRUTH, a t. of Cornwall, consists chiefly of one long street, which stands on a hill, in the center of a famous mining district, $9\frac{1}{2}$ m. n.w. of Falmouth. Iron foundries are in operation; but the principal product of this vast mining district is copper. In the vicinity are many mines, which are worked by large steam-engines. By railway there is easy communication to St. Ives and Falmouth Bays. Pop. '71, 10,685.

RED SANDSTONE was the term formerly applied to the combined Devonian and Permian rocks, when their relations to the carboniferous strata were unknown. The discovery that one set of the red sandstone was below the coal, while the other was above it, caused their division into the old red (q.v.), or Devonian, and the new red, or Permian (q.v.). For some time after this division, the original term red sandstone was retained by a few geologists to characterize the newer set of red rocks, but it is now quite given up.

RED SEA, or **ARABIAN GULF**, an inlet of the Indian ocean, in form a long and narrow gulf, stretching n.w. from the strait of Bab-el-Mandeb (lat. $12^{\circ} 40'$ n.), by which it communicates with the gulf of Aden, to the isthmus of Suez (lat. 30° n.), which parts it from the Mediterranean sea. It separates Arabia on the e. from Egypt, Nubia, and Abyssinia on the west. Its extreme length is over 1400 English m.: it varies greatly in breadth—from about 20 m. at the strait of Bab-el-Mandeb, to upward of 230 at about lat. $16^{\circ} 30'$. At Râs (cape) Mohammed (lat. $27^{\circ} 40'$ n.), the sea is parted into two arms or smaller gulfs, which inclose between them the peninsula of Mount Sinai; that on the w., continuing the direction of the main body of the sea, is the gulf of Suez (Bahr-es-Suweis), of which the strait of Jubal or Jublah forms the entrance; its length is about 180 m.; extreme breadth (about lat. 29°), upward of 30. The e. arm, called the gulf of Akabah (Bahr-el-Akahab), is entered by the strait of Tirân, and runs n.n.e. to lat. $29^{\circ} 30'$ north. Its length is upward of 100 m.; greatest breadth, rather more than 15. The depth of the Red sea varies considerably, but is in many places very great; the deepest sounding is marked as 1054 fathoms, in lat. $29^{\circ} 30'$. Southward of 16° it is comparatively shallow; but the shallowest part of the whole sea is the gulf of Suez, which decreases in depth from 40 or 50 fathoms at the entrance to 3 fathoms in Suez harbor, at the n. end, where the gulf, which is supposed in ancient times to have extended considerably further n., has apparently been filled up by the sand washed up by the strong tides, or drifted in by the winds. The gulf of Akabah is much deeper; it is, in fact, a narrow, deep ravine, with steep and rocky sides, forming the termination of the long valley of the Arabah, running n. into the Dead sea. The basin of the Red sea itself is the lowest portion of a deep valley lying between the highlands of Africa on the w., and the lofty plateau of the Arabian hills on the e., which latter, rising at some little distance inland, leave for the most part a sandy and sterile tract along the sea. The navigation of the Red sea has always been accounted difficult and dangerous, owing to the prevalence of violent winds, and the number of islands, shoals, and coral reefs, which line the shores. The coral reefs extend generally in parallel lines along the coast; they abound in all parts, but are especially frequent on the Arabian side, where the navigation is consequently very intricate. The coral is very beautiful, often red or reddish in color, but more commonly white. The islands generally occur singly, but between the parallels of lat. 15° and 17° , they are found massed in two groups—the Farsan (q.v.) islands on the eastern, and the Dhâlc (q.v.) islands on the western side. In mid-channel, s. of Râs Mohammed, there is generally a width of 100 m. clear. Along this channel, the winds are constant throughout the year in one of two directions: from May to October, the n.w. monsoon blows; for the rest of the year, the s.e. is the prevailing wind, and the water in the northern part of the sea is then raised to a higher level than the Mediterranean. It had been generally supposed that the level of the Red sea was more than 30 ft. higher than that of the Mediterranean, but it is now known, from careful observations, that the levels of the two seas are really the same. The principal ports are, on the Arabian side, Mocha, Jeddah (the port of Mecca), and Yembo (the port of Medina); on the w., Suez, Cosseir, Suakin, and Massowah. The origin of the name Red sea has given rise to a variety of conjectures, and has never yet been satisfactorily settled. It is supposed to have been so called from the name Edôm (red), as the mountains of that country are washed by the waters of the gulf of Akabah: from the red and purple coloring of the rocks which in some parts border it; from the red color sometimes given to the waters by animalcules and sea-weed; or from the reddish tinge imparted to them in some places by the subjacent red sandstone and reddish coral reefs. To the Hebrews it was known as *Yam Suph*, the sea of *weeds* or *sedge*. By the Greeks, in the earliest times, the name Red sea was given to the whole of the Indian ocean, including both the Red sea and the Persian gulf, and not distinctively to the former (which was then and afterward known as the Arabian gulf), though the name in later times gradually became restricted in its application.

From the earliest times the Red sea has been a great highway of commerce between India and the Mediterranean lands, and traversed successively by Egyptians, Phœnicians, Hebrews, and Arabs. It is first mentioned in the book of Exodus, on occasion of the

passage of the Israelites, which is supposed to have taken place a little s. of the present town of Suez. The first recorded navigation of the sea was in the time of Sesostris, in the 14th c. B.C. Three centuries later, Hebrew and Phenician ships traversed the Red sea on the voyage to Ophir, from the port of Eziongeber, at the head of the gulf of Akabah. The gulf of Suez was for many centuries apparently the seat of the Egyptian trade in this sea and to India. After the foundation of Alexandria, and during the dynasty of the Ptolomies and the Roman dominion, the trade with India was vigorously carried on, though the chief seat of traffic was moved further southward, to the towns of Berenice and Myos Hormos, which sent out annually large fleets to India. After the establishment of the Mohammédan empire in the 7th c., an important trade with India and China seems to have been carried on through the Red sea; and through it, in the period between the 12th and 15th c., the goods of the east passed to the Venetian factories in Alexandria, until the discovery of the route round the cape of Good Hope diverted the traffic with India into a different channel, and put an end to the commerce of the Red sea. Since the establishment of the so-called overland route to India, and the opening of the Suez canal in 1870, the Red sea has regained its importance as the highway of commerce between Europe and the east. See SUEZ.

For the classical geography of the Red sea, the *Geographi Græci Minores* of Müller (Paris, 1855), and the atlas appended to it may be consulted. Fuller information on the subject of the Red sea, its coasts, and adjacent lands, will be found in the elder Niebuhr's *Travels*, and *Description of Arabia*; in the *Travels* of Salt, Burekhardt, Ruppell, and others; in Wellsted's *Observations on the Coast of Arabia*, &c.; in Ehrenberg's work on the Coral Islands of the Red sea; Ritter's *Erdkunde*, vol. ii.; and the Admiralty Chart, based on the surveys of Moresby, Carless, and others.

REDSHANK. See SANDPIPER.

REDSHID PASHA, a celebrated Turkish statesman, and long the chief of the party of progress in Turkey, was b. at Constantinople about 1800. He accompanied his brother-in-law, the governor of the Morea, into Greece, and after his death, obtained the post of chief secretary in one of the government offices at Constantinople. On the outbreak of the Russian war (1828-29), he was charged with a mission in Bulgaria, and exerted himself effectually to protect the Christian subjects of the Porte from the fanatic rage of their Moslem neighbors; and on his return obtained from Mahmoud, who fully appreciated his character, a post in the foreign office. On the creation of resident representatives at foreign courts, Redshid pasha was sent to the courts of France and Britain, and applied himself diligently to the study of the language, manners, and political constitution of these countries; but was recalled in 1837, and nominated grand-vizier. His persuasive eloquence and firmness of character greatly aided the sultan in carrying out his plans for the better centralization of the administration, and for mercantile intercourse with foreign nations; but the old Turkish party were still too strong for him, and he was compelled to resign office, and return to Paris and London to support the Turkish against the Egyptian interests. Recalled by the death of the sultan, and the disaster of Nisib, to his old post, the foreign office, he succeeded, after a debate in council of three days' duration, in obtaining the hattisherif of Gulhane (Nov. 3, 1839), a species of constitutional charter, which, from the comparative weakness of its promoters, became a dead letter. The effects of his foreign diplomacy were soon apparent in the humiliation of the Egyptians in Syria; but a seraglio intrigue, which occasioned his dismissal, deprived him of the honor of concluding peace. From 1841 to 1845 he was the Turkish representative at the French court, and though recalled to fill the post of grand-vizier (Sept. 28, 1846), he found his influence at court greatly diminished under the new sultan. He was vigorously supported by sir Stratford Canning, the English ambassador, who was of the opinion that all hopes of a bright future to Turkey depended solely upon Redshid pasha. He was frequently deposed, and almost immediately recalled, according as the anti-reform party gained or lost the ear of the sultan; but the complications with Russia, which arose in 1853, threw the anti-reformers (who had counseled an obstinate disregard of all the Russian representations) into discredit, and Redshid pasha, more powerful than ever, was again recalled to the direction of foreign affairs. In 1854 he was again overcome by his political opponents, and retired from office, which he did not resume till after the peace of Paris. His reappointment as grand-vizier excited great hopes of further salutary reformations; but the French influence at the Porte was pertinaciously antagonistic, and he was twice forced to resign, and as often recalled. At last, worn out with harassing cares and toil, he was seized with an illness, to which he speedily succumbed, at his palace of Emmirgian, Jan. 7, 1858. Though a Turk, he was one of the most enlightened men of his time, and was well versed in foreign languages, general literature, and science.

RED SNOW. The apparent redness of snow, as seen from a distance, is often an effect of light, which adds a peculiar charm to mountain and winter landscapes, particularly in the mornings and evenings, when the rays of the sun fall most obliquely on the surface of the snow. But snow is occasionally found both in polar and alpine regions of a really red color. This phenomenon seems to have been observed by the ancients, as a passage in Aristotle apparently refers to it; but it attracted no attention in modern times till 1760, when Saussure observed it in the Alps, and from chemical experiments

concluded that the red color was owing to the presence of some vegetable substance, which he supposed might be the pollen of a plant. The next observations on red snow were made in the arctic expedition under capt. Ross, when it was found extending over a range of cliffs on the shore of Baffin's bay for eight miles, and the red color penetrating the snow in some places to a depth of 12 feet. On the return of the expedition in 1819, the coloring matter, as then existing in the melted red snow, was subjected to careful examination by Robert Brown and by Francis Bauer, the former most eminent botanist pronouncing it to be an unicellular plant of the order *algæ*, while the latter referred it to *uredo*, a genus of *fungi*, and called it *U. nivalis*. Baron Wrangel afterward declared it to be a *lichen*, and called it *lepraria kermesina*; but Agardh and Dr. Greville of Edinburgh—the latter of whom obtained specimens from the Scottish island of Lismore—on further examination, returned to the opinion of Brown, an opinion which has since been fully confirmed, and the plant is generally known by the name *protococcus nivalis*, given to it by Agardh, or *palmetta nivalis*, given to it by sir William Hooker. The notions of this microscopic plant in the earlier stages of its existence have led some observers, and among them eminent naturalists, to regard the organisms which they found in red snow as animalcules. See PALMELLACEÆ. But while no doubt is now entertained of its real nature, it is not impossible that animal as well as vegetable life may exist in red snow, and that real animalcules may have been observed. The red snow plant consists, in its mature state, of brilliant globules like fine garnets, seated on, but not immersed in, a gelatinous mass.

REDSTART, *Phœnicura ruticilla*, or *Ruticilla phœnicura*, a bird of the family *sylviacæ*, nearly allied to the redbreast, but having a more slender form and a more slender bill; the male in summer having the head, back, and wing-coverts gray; the forehead white, with a narrow black band at the base of the bill; the throat, sides of the neck, and face jet black; the wings brown, the tail and upper tail-coverts bright rufous chestnut, with a strip of dark brown on the centers of the two middle feathers; the rest of the underparts mostly pale chestnut. The female is grayish-brown, with neither the white nor the black on the head, and less red on the tail. The redstart is widely diffused over Europe, Asia, and the north of Africa. It appears in Britain as a summer bird of passage, and is found in almost all parts of the island. It is a bird of very lively manners, remarkable for the way in which it flits about, in and out of some hedge or bush, where it is in quest of insects. It has a very soft melodious song, which is continued during the breeding-season far into the night, and resumed at early dawn. In confinement it becomes very tame, and has been known to imitate the song of other birds, and even to learn a tune.—The blue-throat (q.v.) also belongs to the same genus.—The AMERICAN REDSTART, *Setophaga ruticilla*, is a small bird of the family *muscipicæ*, or fly-catchers, common in most parts of North America, a bird of great beauty, and extremely active in its movements.

REDUCTION, in arithmetic, is the conversion of a quantity in one denomination to an equivalent one of a different denomination. In the reduction of a quantity from a higher to a lower denomination the process of multiplication is employed; and, contrarily, division is the needful process when a number of a lower denomination has to be reduced to an equivalent number of a higher.

REDUCTION, in Scotch law, means the annulling or setting aside of a deed or instrument, and thereby annihilating its legal effect. The action of reduction commences with a summons requiring the defender to bring the deed into court to be set aside, stating the reasons of reduction. The defender, if he defend the action, returns the summons, which implies that he intends to satisfy the production; i.e., to produce the document and maintain its validity. The action can be raised only by a person who has some title or interest connected with the matter.

REDUCTION OF METALS. A metal is said to be reduced to its metallic state when it is separated from the condition of a chemical compound in which it exists as an ore. This is generally effected either by the direct action of heat, or by heating the compound along with a *reducing agent*. Thus, when oxide of mercury is simply heated, the oxygen is given off as gas, and mercury or quicksilver appears as metal. Again, when sulphuret of lead is heated with iron, sulphuret of iron is formed, and the lead is reduced to its metallic state. In this case the iron is the reducing agent. The principal reducing agent employed in metallurgy is carbon, or rather the gas carbonic oxide, which is formed under certain conditions when carbon is burned. See METALLURGY, IRON.

REDUIT, in fortification, is a central or retired work within any other work, intended to afford the garrison a last retreat, whence they may capitulate. It is commonly of masonry, loopholed, and often circular. Many engineers doubt the use of reduits altogether, as blocking up the working space, being themselves inconvenient for the men, and incapable of protracted defense, while they frequently mask the fire of other works more to the rear.

RED-WATER, also known as bloody urine, moor-ill, and hematuria, is a disease of cattle, and occasionally of sheep; it depends upon the eating of coarse indigestible nutritive food, on continued exposure to inclement weather, and on other such causes, which lead to a deteriorated state of the blood. In England and Ireland it affects cattle

of all ages and of both sexes; but in Scotland it is most common amongst milk cows within a fortnight after calving. The appetite and rumination are irregular, the bowels speedily become constipated, and the urine reddened with the broken-down red globules of the blood. In the more advanced stages of serious cases the urine is black. A dose of physic must at once be given, and for an adult animal may consist of $\frac{1}{2}$ lb. each of common and Epsom salt, 3 oz. of sulphur, and a pound of treacle, mixed together in two bottles of water. Roots should be withheld, and the food consist of sound hay with a little cake. A full supply of pure water is further essential. Weakness, which is apt to supervene, may be warded off by giving several times daily two ounces each of gentian and ginger in a quart of ale. To prevent red-water, attend to feeding and watering, place rock-salt in the pastures and yards; and, as has been successfully done in Cheshire and other English counties, improve the grazing-lands, notorious for the production of the disease, by draining, liming, and manuring; and where these means are ineffectual, by plowing them up and cropping them for a few years.

RED WILLOW, a co. in s.w. Nebraska, adjoining Kansas; drained by the Republican river and Red Willow creek; about 725 sq.m.; pop. '80, 3,044—2,771 of American birth. The surface is rolling with little timber. The soil is fertile. The principal production is corn. Co. seat, Indianola.

REDWING, *Turdus iliacus*, a species of thrush (q.v.), well known in Britain as a winter bird of passage. It spends the summer in the northern parts of Europe and Asia, and even occurs in Iceland; its winter range extends to the Mediterranean. In size, it is about equal to the song-thrush or mavis. The general color is a rich clove-brown on the head, upper parts of the body, and tail; the wing-feathers darker, but with lighter external edges; the lower parts mostly whitish, tinged and streaked with brown; the under wing-coverts and auxiliary feathers bright reddish-orange. The redwing arrives in Britain rather earlier than the fieldfare (q.v.), and, like it, congregates in large flocks. It has an exquisite song, which it pours forth from the summit of a high tree, gladdening the woods of the north.

REDWING, a city in s.e. Minnesota, on the s. bank of the Mississippi river; pop. about 7,000. It is the co. seat of Goodhue co., 6 m. s. of the point where the Cannon river empties into the Mississippi, on the river division of the Chicago, Milwaukee, and St. Paul railroad. It is 58 m. below St. Paul by water, 41 m. by rail, and 63 m. n.w. of Winona. It is built on a plain nearly level with the river, the bluff on the s.w. rising to the height of 300 feet. It contains 13 churches, public schools, an opera house, a music hall, a court-house, 3 banks, and 3 newspapers; and is the seat of the Redwing collegiate institute. It is the center of a great wheat-growing country, large quantities of which are exported from this market. Its industries consist of the manufacture of flour, agricultural machinery, steam-engines, lumber, etc.

REDWOOD, the heart-wood of *adenanthera pavonina* (*leguminosa*), a large tree growing in India, where it is called *rukta-chundun*, and is much used in dyeing red. Small quantities are brought to this country for the same purpose, but it is not in much demand.

REDWOOD, a California conifer, the *sequoia sempervirens*, growing upon the Coast mountains of that state. It is next in size to the *sequoia gigantea*, or "big tree." See CALIFORNIA. It often attains a height of 250 ft, and sometimes 280 ft., with a diameter, in the largest, of 15 feet. It furnishes excellent lumber. The green wood has a fine red color, but on exposure to the air and light it fades.

REDWOOD, a co. in s.w. Minnesota, drained by the Minnesota, Big Cottonwood, and Redwood rivers, on the Chicago and North-western railroad; about 1190 sq.m.; pop. '80, 5,373—3,767 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, and oats. Co. seat, Redwood Falls.

REDWOOD, ABRAHAM, 1710—88; d. Newport, R. I.; founder of the Redwood library of Newport, to which he gave £500. The library building was completed in 1750. He was a member of the society of Friends, and emigrated from Antigua, West Indies.

REE, LOUGH, a lake in the middle of Ireland, between Connaught on the w. and Leinster on the e., is an expansion of the river Shannon (q.v.).

REED, the common English name of certain tall grasses, growing in moist or marshy places, and having a very hard or almost woody culm. The COMMON REED (*phragmites communis*, formerly *arundo phragmites*) is abundant in Britain and continental Europe, in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The culms are 5 to 10 ft. high, and bear at the top a large much-branched panicle of a reddish-brown or yellowish color, having a shining appearance, from numerous long silky hairs which spring from the base of the spikelets. The two outer glumes are very unequal; and the spikelet contains 3 to 4 perfect florets, with a barren one at the base. The culms, or stems, are used for making garden screens, for light fences, for thatching houses and farm-buildings, for making a framework to be covered with clay in partitions and floors, for battens of weavers' shuttles, etc. So useful are reeds in these ways, and particularly for thatching, that it is found profitable in

some places to plant them in old clay-pits, etc. Probably they might be planted with advantage in many peat-mosses, where they are now unknown. The plant is not very common in Scotland; but in the fenny districts of the e. of England it covers large tracts called *reed-ronds*, and similar tracts occur in many parts of Europe.—Nearly allied to this is *arundo donax*, the largest of European grasses, plentiful in the s. of Europe, and found in marshy places as far n. as the s. of the Tyrol and of Switzerland. It is 6 to 12 ft. high, and has very thick, hollow, woody culms, and a purplish-yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarionets, mouth-pieces of oboes, etc. They are also made into walking-sticks and fishing-rods. The creeping roots contain much farina and some sugar.—*Arundo karka* is supposed to be the grass called *sur* in Sindh, of which the flower-stalks are very fibrous; and the fibers, being partially separated by beating, are twisted into twine and ropes.—The SEA REED is *ammophila* (q. v.)—or *psamma*—*arundinacea*.

REED. See LOOM.

REED, in music, the mouthpiece of a hautboy, bassoon, or clarionet. Also, a piece of metal with a brass spring or tongue attached to it in such a way that the admission of a current of wind causes it to vibrate and sound a musical note. The reed is of two kinds, the *beating reed* and *free reed*. The former is used in the reed-pipes of an organ (q. v.), and requires to be placed within a tube in order to produce a musical sound. It consists of a metallic cylinder, with the front part cut away, and a brass spring or tongue placed against the opening, and attached at the upper end. The admission of air to the pipe in which the reed is placed causes the tongue to vibrate against the edge of the opening, so as to cover and uncover the slit, through which the air passes to the pipe above, the regularly repeated beat producing a musical note, dependent for its pitch on the length of the tongue, which is regulated by a strong spring of wire pressing against it. The quality of the sound is determined to a large extent by the length and form of the pipe in which the reed is placed. The *free reed* differs from the beating reed in this, that the tongue is a little smaller than the opening, and strikes, not the edge of the opening, but the air. The admission of a current of wind causes it to yield so as to let the air pass, while, after recovering its position, it is carried by its momentum equally far on the other side, and continues vibrating so long as the current of air is continued, the result of the pulsations being a musical note. The invention of the free reed has been ascribed to M. Grenié, a Frenchman, who brought it into use, but it has been long known to the Chinese. Its note is more smooth and mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter. Besides being occasionally adapted to organ-pipes, it is used without a pipe in the harmonium (q. v.).

REED, ANDREW, D.D., 1787-1862; b. London; worked at his father's trade of watch-making, spending his leisure in study; learned Hebrew and Greek; entered the collegiate and theological seminary at Hackney; was pastor of the Independent church in New road, East London, for 50 years. One of the most successful preachers, and pastor of one of the largest churches of the metropolis, he yet found time to establish and visit the Hackney grammar-school and five national benevolent institutions. He established schools for the children of sailors, founded the first penny bank for savings, and was active in promoting Sunday and day schools for the industrial classes.

He had remarkable power in the pulpit and on the platform. He wrote many works on practical theology; also many hymns. In 1835 he visited the United States as a delegate of the Congregational union of Britain, and on his return published *Visit to the American Churches*, 2 vols.

REED, SIR CHARLES, 1819-81; b. England; elected to parliament for Hackney in 1872; visited the United States in 1873 as delegate to the evangelical alliance. He was president of the Sunday-school union of England and Wales, and proprietor of the *London Daily News*.

REED, EDWARD JAMES, b. England, 1830; educated at the scientific and naval construction school at Portsmouth; became a recognized authority on ship-building, and secretary of the naval architects' institute. In 1866 he was appointed by the government chief naval constructor, and built many iron-clads. There was some dissatisfaction with his turret ships, and in 1870 he resigned his office. In 1874 he was returned to parliament as a liberal. He has published several papers on iron-ship-building and kindred topics.

REED, HENRY, LL.D., 1808-54; b. Philadelphia, graduated at the university of Pennsylvania, 1825; studied law, and was admitted to the bar in 1829. In 1831 he became an instructor in the university of Pennsylvania, and in 1835 professor of rhetoric and English literature. He published several lectures and essays on English history, language, and literature, the most important being *Lectures on English Literature* (1855).

REED, JOSEPH, 1741-85; b. N. J.; educated at the college of New Jersey. He studied law in England, began practice at Trenton, and in 1767 became deputy secretary of New Jersey. On his return in 1770 from a second visit to England, where he mar-

ried, he removed to Philadelphia, served on the committee of correspondence, and was president of the first Pennsylvania convention in 1775. The same year he was a delegate to the continental congress and became Washington's secretary and aid-de-camp. He was adjt. gen. during the New Jersey campaign, whose success was due in no small degree to his knowledge of the ground. He declined the posts of chief-justice of Pennsylvania and brig. gen., and remained in the army as a volunteer without pay. He was a member of congress in 1778, and signed the articles of confederation. At this time gov. Johnstone, one of the British commissioners, offered him £10,000 and the best office in America if he would exert himself to bring about a settlement of the quarrel between the colonists and Great Britain. Reed replied: "I am not worth purchasing; but such as I am, the king of Great Britain is not rich enough to buy me." He was president of the Pennsylvania supreme executive council 1778-81, suppressed the revolt of the Pennsylvania line in the latter year, and had previously caused the trial of Arnold for maladministration. Bancroft's charge, in his *History*, that Reed was in British pay, has given rise to a sharp controversy, and is not usually deemed well supported.

REED, WILLIAM BRADFORD, LL.D., 1806-76; b. Philadelphia; graduated at the Pennsylvania university, 1822. He studied law and began practice after his return from Mexico, where he went in 1825 as private secretary to the U. S. minister. In 1838 he was made attorney-general of Pennsylvania, and in 1857 minister to China, where he negotiated the treaty of 1858. He contributed articles to the *New York World* and *Quarterly Review*, and published a number of biographical, literary, and historical papers.

REED INSTRUMENTS. The Chinese appear to have had an instrument comprised in a series of tubes with tongues, played upon by the mouth, as early in their history as we know anything about them. For the accordion we are indebted to Germany, where it was invented in 1829. Reed organs were invented in the United States, the first patent having been taken out in 1812, and including all reed instruments. It was not until five or six years later that a reed organ was actually made, and then it was very imperfect. Between 1825 and 1835 a large number of reed instruments were devised, mostly intended to be played by hand, as in the case of the concertina. The reed organ was, in fact, an enlargement of the accordion, conceived when that instrument had grown to a size that was unwieldy. This became an instrument with free reeds and without pipes, supplied with wind by the working of the foot. Under the names of seraphine, melodeon, and harmonium, it was gradually improved until it became an instrument of great power and sweetness. The melodeon was greatly improved by Mr. J. Carhart as early as 1836, and ten years later his instruments were being largely manufactured, and became very popular. In his instrument the reeds were acted upon by inflowing streams of air, by means of a special arrangement of the bellows. This was still further improved later on by Mr. E. P. Needham. A new discovery in this direction was that of the effect produced by curving or twisting the reeds, and was made by Mr. Emmons Hamlin of Rome, N. Y., in 1848, and applied to the now well-known Mason & Hamlin organ. At the Paris exposition of 1855, the American reed organs produced a marked impression, and this has been increased with the promulgation of each new improvement in these instruments. See HARMONIUM, *ante*.

REED MACE. See TYPIA.

REED WARBLER. See WARBLER.

REEF, in naval matters, is a portion of a sail included between the bottom of the sail and a parallel row of eyelet-holes a short distance above it, or between such row of eyelet-holes and a parallel row higher up. The object of the reefs is to reduce the size of the sail when the wind becomes boisterous. For this purpose cords are inserted at each eyelet-hole, which, when the sail is unreefed, hang freely. When the intention is to take in a reef, the sail is slightly lowered; the men climb out along the yard or boom below its lower edge, fold the loose sail on the yard, and fasten the reefing-lines securely round the yard and sail thus folded. There are also systems of small ropes in some ships by which the sail may be reefed from the top without the men incurring the danger of going out on the yard during tempestuous weather.

REEL, a lively dance peculiar to Scotland, which may be danced by two couples, but admits a greater number. The music is in general written in common time of four crotchets in a measure, but sometimes in jig time of six quavers.

REEL-WINDING MACHINE, a beautiful contrivance, now used by the manufacturers of sewing-thread. It is for the purpose of winding the thread on to the reels upon which it is sold for use; and not only does it turn a number of reels round so as to wind the cotton upon them, but, by a peculiar arrangement, every turn is so managed that the cotton is reeled with the most beautiful regularity, each turn of the thread being laid on by the side of the previous one, and never crossing it.

RE-ENTERING ANGLE, in fortification, is an angle in the line of works of which the apex points away from the front. As an example, the flanks of a bastion make re-entering angles with the adjoining curtains. Advantage is commonly taken of the com-

paratively sheltered position of these angles to form *places d'armes* for the assembly of troops.

RE-ENTRY is a legal term used in leases, whereby the landlord stipulates for power to re-enter the premises in certain conditions, such as the non-payment of rent after the lapse of a specified period from the time it became payable. Before, however, the power of re-entry can be exercised, all the conditions must be strictly complied with.

REES, ABRAHAM, 1743-1825; b. Wales; studied for the ministry at Hoxton academy. He was for many years mathematical tutor there, and pastor of a Presbyterian church in Southwark. In 1783 he was settled over a church in the Old Jewry. He was a fellow of the Royal and Linnæan societies. He edited *Chamber's Cyclopædia*, 1781-86, and *Rees's Cyclopædia*, 45 vols., 1802-19.

REEVE (Sax. *gerefa*, Ger. *graf*), a magistrate existing in early times in England and elsewhere in northern Europe, whose duties were at first principally fiscal. In the Saxon period in England, he represented the lord of a district, whether township or hundred, at the folk-mote of the county; and within his district he levied the lord's dues, and performed some of his judicial functions. The word still survives in the shire-reeve or sheriff (*scyr-gerefa*), who was at first assessor to the ealdorman or earl, who, along with the bishop, presided, but afterward became himself the presiding officer. Similar functions were exercised in boroughs by an elective officer called the portreeve. In Anglo-Saxon times all the English boroughs were subject to the rule of a portreeve, for whom the Norman conquerors substituted a bailiff, who, in the larger towns, was allowed to assume the appellation of mayor.

REEVE, a verb used in speaking of ropes, signifies the passing of a rope through any hole, dead-eye, block, or pulley, in conjunction with which it is to be used.

REEVE, HENRY, D.C.L., b. England, 1813; educated at Geneva and Munich. In 1837 he became registrar of the privy council, which office he retains. He became editor of the *Edinburgh Review* in 1855. Among his works are a translation of De Tocqueville's *Democracy in America*, and of Guizot's *Washington*; and the *Journal of the Reigns of King George IV. and William IV.*, by C. C. F. Greville.

REEVE, TAPPING, LL.D., 1744-1823; b. Long Island; educated at the college of New Jersey. In 1772 he began to practice law in Litchfield, Conn., where 12 years later he began the famous Litchfield law-school, the first in this country. He conducted this till 1820; after 1798 in association with judge James Gould. Many men eminent in the politics and the law in later years were pupils here. He was a justice of the Connecticut supreme court 1788-1814. He published legal treatises on the *Law of Descents* and *The Domestic Relations*.

REEVES, SIMS, an eminent tenor, b. at Woolwich in 1821. Before attaining his fourteenth year he was a clever performer on various instruments, and tolerably well versed in composition; and at that early age he was appointed organist and director of the choir in the church of North Cray in Kent. His musical education was conducted under J. B. Cramer, T. Cooke, and other artists of note. He first appeared in public as a baritone at Newcastle in 1839. His *début* was a complete success; and he acquired fresh fame in Scotland and Ireland. In order to perfect his voice and style, he went to Paris, and after studying there for some time, appeared a Milan in the tenor part of "Edgardo" in *Lucia di Lammermoor*, when his singing electrified the audience. He returned to England in 1847, and coming out at Drury Lane as "Edgardo," was immediately recognized as the first living English tenor, and was engaged in 1848 at Her Majesty's theater. In 1851 he was equally successful as first tenor at the Italian opera in Paris. One of his best original parts was in Macfarren's opera of *Robin Hood*, produced in 1860.

REFERENCE, as a legal term, means the sending by a court, or by agreement of the parties, the decision of a matter to an arbitrator, or to an officer of the court or master. In cases where parties, without going the length of commencing litigation, agree to arbitration, they usually execute a deed or agreement of submission; but after litigation has begun, if the judge think it would be better that an arbitrator should settle the dispute, an order of reference is drawn up for that purpose.

REFERENDARY, a name given in the early kingdoms of Europe to a public officer, whose duty was to procure, execute, and dispatch diplomas and charters. The office of great referendary to the monarchy of France merged eventually in that of chancellor.

REFINING OF METALS. The last operation connected with the smelting of copper, tin, lead, and some other metals, is usually called the refining process. With copper, for example, the impure or "blister" copper, containing from 95 to 98 per cent of the metal, alloyed usually with small quantities of iron, tin, antimony, etc., is melted in a refining furnace, and exposed to the oxidizing influence of the air. By this means, the foreign metals present become oxidized, and rise to the surface as slag, which is skimmed off; the oxide of copper, formed during the process, being afterward reduced by throwing coal on the surface of the melted metal, and stirring with a pole of green wood. The disengagement of gases from the wood during the "poling" causes the metal to

splash about, and so expose every portion of it to the reducing action of the coal; thus the oxide of copper is deprived of its oxygen, and the copper rendered nearly pure.

Tin is also refined by throwing billets of green wood into it while in a melted state, which has the effect of bringing impurities to the surface as froth, in a somewhat similar way to the oxidizing of foreign metals in copper. See **TRIN**.

Lead is purified from antimony and tin by an analogous mode of oxidation, and silver is separated from it by a special process. See **LEAD**.

The refining of iron is a name applied to the process for partially separating the carbon from cast iron, and is described under **IRON**. Of the less important metals used in the arts, zinc, antimony, and mercury do not usually undergo any special refining process; aluminium, it is said, will not afterward fuse when once reduced to the metallic state; and nickel, of which German silver is largely composed, is refined by a process or processes kept strictly secret by manufacturers.

We may state here that no metal is ever quite pure in its commercial state, even though it has gone through the usual operation of refining, but all are to a certain extent alloyed with certain others. For the great majority of purposes, it is not necessary that metals should be chemically pure, and when it is, they can only be made so by refined chemical processes.

It will be readily understood, however, that it is always necessary to carry the refining of gold and silver further than the less valuable metals. To render gold sufficiently pure for manufacture into coin, an ingenious process has, within the last few years, been proposed, by which fused gold is mixed with about 10 per cent of black oxide of copper, and then stirred so as to oxidize any foreign metals which happen to be present. The oxide of copper does not fuse, but is disseminated through the melted metal, and oxidizes any tin, antimony, or arsenic, and causes them to rise to the surface, so that they may be skimmed off. Perfectly pure gold is prepared by dissolving the metal in aqua-regia—a mixture of nitric and hydrochloric acids—and precipitating silver (with which it is almost always alloyed) as well as any other foreign metals by chemicals which have no action on the solution of gold. The metallic gold is afterward precipitated as a finely divided powder, by a salt of iron, and is then fused and cast into bars.

Silver is rendered pure by dissolving it in nitric acid, filtering the solution, and then precipitating the metal with common salt as a chloride of silver. This is afterward mixed with sulphuric acid, and then, by introducing bars of zinc, a chloride of zinc is formed, while the silver is reduced to the metallic state.

REFLECTION. See **CATOPTRICS**, **HEAT**, **UNDULATORY THEORY**. In the articles referred to, the laws of reflection are stated, illustrated geometrically, and deduced from the modern theory of the nature of light and radiant heat.

We may now mention one or two curious circumstances connected with reflection, which could not well be given in any of these articles.

In general, a reflected ray is more or less *polarized* (see **POLARIZATION**); and if the reflecting surface be metallic, or if it be formed of a substance of high refractive index, as diamond, it is in general *elliptically* polarized.

In various cases, principally known by the laborious investigations of Brewster (q.v.), the *color* of the reflected light not only differs from that of the incident light, but is different for different angles of incidence, and for different azimuths of the plane of reflection. The theoretical explanation of these very singular facts has not been as yet very satisfactorily given. In fact, the problem of reflection from the surface of a metallic or a crystalline substance is one which presents difficulties of a very formidable kind, principally from the want of definite data for the formation of a satisfactory fundamental hypothesis; and, in a secondary manner, from the intricacy of the requisite mathematical investigations.

REFLEX ACTION. See **NERVOUS SYSTEM**.

REFORM, PARLIAMENTARY, the name generally given to the acts which passed the legislature of the United Kingdom in 1832, by which an extensive change was made in the system of parliamentary representation. Parliamentary reform had for many years before been a topic of popular agitation. So far back as 1782, a motion by Mr. Pitt for a reform of the franchise was lost by a majority of 20, and similar motions in the years 1783 and 1785 by majorities of 44 and 74. The horror inspired by the excesses of the French revolution caused a reaction, and the repression for a time of all liberal tendencies; and it was not till some time after the close of the French war that the desire for reform again manifested itself. Mercantile distress had added to the popular dissatisfaction, which was fomented by the revolutions of 1830 in France and Belgium; and an adjustment of the inequalities of the representative system, with an extended franchise, was looked forward to as a panacea for all the ills under which the community labored. The demand for parliamentary reform became more imperious on the death of George IV. and accession of William IV. Meetings were held over all the country, and though there was no open rioting, a constant alarm was kept up. On the resignation of the duke of Wellington, Nov. 16, 1830, the celebrated reform ministry of earl Grey came into office. Parliament assembled on Feb. 3, 1831, and on Mar. 1 lord John Russell proposed his first scheme of reform. After a long and animated discussion, the bill passed the second reading by a majority of 1. On the motion for a committee, gen. Gascoyne moved, as

an amendment, that the number of representatives for England and Wales should not be diminished; and the amendment being carried by a majority of 8, the ministry abandoned the bill, and resorted to a dissolution. The cry arose through the country of "The bill, the whole bill, and nothing but the bill;" and when the new parliament assembled on June 14, a large majority, including the whole of the county members for England, excepting four or five, were pledged to support the bill, which was again introduced on June 24, and passed the third reading of the house of commons by a majority of 113. The upper house, however, threw it out on the second reading, by a majority of 41, and parliament was immediately prorogued. It reassembled on Dec. 6, and on Dec. 12 the third reform bill was introduced in the commons by lord John Russell, which did not, like the former bills, diminish the number of members—a concession which the opposition considered as an improvement, and it had a majority of 116 on the third reading. In the lords, the second reading was carried by a majority of 9, and the bill ordered to be committed. In committee, lord Lyndhurst carried, by a majority of 35, a motion that the disfranchising clause should be postponed, and the enfranchising first considered; on which, the king having refused to accede to a creation of peers sufficient to carry the bill, the ministry resigned. A week of intense public agitation followed. The government were induced to resume office on the king granting them full powers to secure majorities by the creation of peers; but eventually that expedient was avoided by a sufficient number of lords absenting themselves to leave ministers a majority on the third reading, when the bill passed by a majority of 84, receiving the royal assent by commission on June 7, 1832. Reform bills for Scotland and Ireland were immediately afterward introduced and carried. For the details of the alterations made by these several measures on the distribution of members and the electoral qualification, see PARLIAMENT. The changes effected were so sweeping as to cause many of the advocates of reform to be apprehensive that the balance of the constitution would be disturbed by the preponderance of the democratic element; but the determination of the masses was such, that the conservative influences of the country were powerless to stay or modify the measure. Yet no sooner was the contest at an end than a reaction followed, falsifying equally the hopes of the supporters of the bill, and the fears of its opponents.

In 1854 a new reform bill was introduced by lord John Russell for a further extension of the suffrage; but it was unaccompanied with anything like popular excitement, and was withdrawn in consequence of the breaking out of the Crimean war. A reform bill brought in by Mr. Disraeli in 1859 was rejected in the commons by a majority of 39, and the consequence was a dissolution and change of ministry. The ministry of lord Palmerston and lord John Russell, which succeeded to power, introduced and afterward withdrew a reform bill.

No one, remembering amid what apathy that took place, would have expected, within so few years, to see the subject revive, and assume such large dimensions. Mr. Gladstone's speech of 1864 first gave new life, and his declaration, that it lay with those who refused the elective franchise to justify the refusal, sounded the commencement of the new agitation. At the general election of 1865, reform was necessarily much discussed. The death of lord Palmerston gave the country a ministry in which lord Russell led the house of lords, and Mr. Gladstone led the house of commons. This ministry was not long in attacking the subject, and the reform discussions of 1866, so valuable as preparing for the final settlement of the question, commenced. The ministry adopted a suggestion which Mr. Bright had made, and tabled first a bill dealing with the franchise alone. Its proposals were of a moderate enough description, its leading provisions being to give the franchise to occupiers of premises of the annual value of £7 in boroughs, and of £14 in counties. At the desire of the opposition, led by Mr. Disraeli and lord Stanley, government introduced its redistribution of seats bill, and the two bills were combined and sent to committee together. In committee, parliament proved unmanageable. Several clauses were carried by the narrowest majorities, till at length, on the comparatively small question, whether "clear" or "ratable" annual value should be taken as the basis of the franchise, government was left in a minority of seven. The leaders, true to the traditions of party, resigned, and left the question of reform to the conservatives.

The resignation was beneficial to progress. In the autumn following it, numerous mass meetings, conducted in general with perfect order, were held; and some unlucky speeches of the opponents of any reduction of the franchise were employed more or less unfairly in order to get a starting-point for the kind of eloquence that such meetings require. It now became plain that the main drawback to reform, the alleged indifference of the working classes, had ceased to exist. Reform therefore became inevitable; and it was equally clear that if reform was to be carried by the conservatives, the country would not accept from them a measure of the moderate character which it would have gladly taken from the liberals shortly before.

The meeting of parliament in 1867, it is said, found the ministry of lord Derby and Mr. Disraeli still undecided. But it was necessary to do something. The queen's speech accordingly broached the matter; and in the beginning of the session, Mr. Disraeli proposed to deal with the subject by way of resolution. His resolutions, however, were vague, and had to be withdrawn. Mr. Disraeli then (Feb. 25, 1867) made a speech, in which he proposed to bring in a bill, with a £6 rating franchise in boroughs, a £20 rating

in counties, and with some of what were called "fancy" franchises. With the redistribution question he proposed to deal much as his actual bill afterward dealt. This proposed bill was understood to be a compromise with a section of the cabinet not favorably disposed to reform. However, as it did not succeed in making matters smooth, the leaders of the government are said to have reverted to what was their original policy. The dissentients, lord Carnarvon, lord Cranborne, and gen. Peel, then resigned, and (on of Mar. 18) the reform bill of 1867 was introduced.

The bill surprised the country. Mr. Disraeli has since said that, so far back as 1859, he and lord Derby came to the conclusion, that if the £10 line, at which the reform act of 1832 had fixed the borough franchise, were disturbed, there was no other fixed line tenable; and he has made the further revelation, that he spent the interval between 1859 and 1867 in educating his party to the belief that, if the borough franchise was to be dealt with at all, it must be dealt with in the boldest manner. His bill, therefore, carrying out this policy, proposed that all householders within boroughs who were rated for the payment of poor-rates should be entitled to vote. There were certain "securities" attached to this proposal. The householder must have resided two years in the borough, and must have personally paid his rates. Further, the "fancy franchises," which again made their appearance, had coupled with them what was called the "dual vote," the object of which was to give to every householder who possessed one of them a second vote in addition to the first, which his house would give him. In counties, the bill proposed a £15 rating franchise, and all existing franchises were permitted to remain. In redistribution of seats, the bill proposed to take the second member from each borough of less than 7,000 inhabitants, and to divide these seats, together with the seats taken from the corrupt boroughs, in nearly equal proportions between the larger counties and boroughs, giving one also to London university.

The bill was not permitted to pass without many alterations. Government, either influenced by a sincere desire for reform, or convinced that, as reform was at any rate unavoidable, it was better that it should pass under their management than under the management of their opponents, were quite resolved that a bill should pass. They yielded to the house whenever they well could, and when they could not, the threat of dissolution at once brought the house to reason. The result of the labors of the session admits of being shortly stated.

The borough franchise remained substantially as first proposed. Much of the session was lost in devising clauses by which the rating principle could be applied to those tenants whose landlords compounded for their rates. The principle was, however, maintained; and an amendment introduced by Mr. Gladstone, with a view of fixing the hard and fast line of £5, was rejected. But by a new clause, the system of compounding was put an end to, so that the franchise was really given to all householders except those excused from rating on the score of poverty. The period of residence, on the motion of Mr. Ayrton, was reduced from two years to one. On the motion of Mr. McCullagh Torrens, an important addition was made in the shape of the lodger franchise. Mr. Disraeli's bill of 1859 had contained a provision of the kind, and something like it was again added. It gives votes to all lodgers who have occupied for a year lodgings which would let unfurnished for £10, and who apply to be put on the roll.

The county franchise was reduced from £15 to £12 rating; and there was added (on Mr. Colville's motion) a reduction of the copyhold and leasehold franchise, giving votes to all owners or life-renters of the free annual value of £5 in property other than freehold, which continues to yield a 40s. franchise.

The dual vote was early abandoned, and its abandonment involved that of the "fancy" franchises. These have now only interest as matters of history; but as the name appears often in the discussions, it should be mentioned that, in their last form, they proposed to give votes to all who paid £1 annually in direct taxes (not including licenses), who belonged to certain of the better educated professions, or who had £50 in a savings-bank or in the funds. Mr. Mill's proposal to extend the franchise to women found 73 supporters. The vote by ballot was rejected, equally with the government proposal to take the vote by means of voting-papers.

The comparatively restricted proposals of the government with regard to redistribution of seats were considerably extended. On Mr. Laing's amendment, the limit at which boroughs then returning two members should hereafter return only one, was raised from 7,000 inhabitants to 10,000. This gave 38 seats to be distributed,* making, with the 7 seats forfeited for bribery by the boroughs of Lancaster, Yarmouth, Reigate, and Totness, 45 in all. Of these, 25 were given to the larger counties, which were severally divided into two or more districts for the purpose.† To boroughs, 19 new mem-

* The boroughs from which one member each was taken were Andover, Bodmin, Bridgenorth, Bridport, Buckingham, Chichester, Chippenham, Chipping-Wycombe, Cirencester, Cokermonth, Devizes, Dorchester, Evesham, Great Marlow, Guildford, Harwich, Hertford, Honiton, Huntingdon, Knaresborough, Leominster, Lewes, Lichfield, Ludlow, Lymington, Maldon, Marlborough, New Malton, Newport (Isle of Wight), Poole, Richmond, Ripon, Stamford, Tavistock, Tewkesbury, Thetford, Wells, and Windsor.

† West Kent, North Lancashire, East Surrey (already having two members each), and South Lancashire (already with three members), were subdivided, and two members given to each division, which absorbed 7 seats; and the counties of Chester, Derby, Devon, Essex, Lincoln, Norfolk, Somerset, and Stafford, together with the West Riding (all already in two divisions, with two members

bers were given—8 by way of additional members to boroughs already possessing members, and 11 to new boroughs.* To the university of London, one member was given. Mr. Laing's proposal to make the scheme of redistribution still more extensive, by applying to all boroughs having fewer than 5,000 inhabitants the system of grouping which prevails in Wales and Scotland, was rejected.

The only amendment of importance which the house of lords succeeded in making was the addition of the system of representation of minorities. By this system, persons voting in London, where four members are returned, cannot vote for more than three; and in the counties and boroughs which return three members, cannot vote for more than two. The object is to prevent a majority, which may possibly exceed the minority by only one man, from monopolizing the whole representation. The plan appeared first in lord John Russell's bill of 1854, and, having then been unpopular with both sides, does not appear to have been proposed since. Mr. Disraeli took occasion, in introducing his bill, to declare himself against it. Mr. Lowe proposed to add it in the commons; and his proposal was supported by such men as lord Cranborne among the conservatives, and Mr. Mill and Mr. Fawcett among the liberals. Mr. Bright joined the government in opposing it, and it was lost by a majority of 141. In the house of lords, its insertion was again proposed by lord Cairns, and carried by a very large majority, most of the conservatives voting for it against the government. When the lords' amendments were considered in the commons, it was the only one of them which was agreed to. It is hardly necessary to say that a scheme such as that of Mr. Hare, for carrying out the principle in a rigorous and complete manner, was found to be far in advance of the day.

The opportunity of passing the reform bill was taken to provide for some minor improvements. The inconvenience of having parliament dissolved by the demise of the crown was obviated, and it was provided that ministers of the crown and their subordinates changing from one office to another should not have to submit to re-election. A boundary commission was appointed to readjust the boundaries of the boroughs and counties. Mr. Fawcett's proposal to throw the necessary expenses of elections, such as the expenses of polling-places, sheriffs, etc., on the borough or county rates, was, however, rejected.

Such is the reform act (for England) of 1867. Its passing, in some shape or other, from the temper of the government and its power of controlling the house, was at no time in serious risk. The most critical period was when Mr. Coleridge's amendment was brought forward, with the view of making way for Mr. Gladstone's amendment of the £5 rating limit; and here the government were served by the defection from the liberals of "the tea-room" party—a large number of "extreme" and "independent" liberals, some of whom really preferred the *quasi* household suffrage scheme of the government, and others of whom were only resolved that a bill of some kind should pass. Mr. Gladstone's amendment was thus defeated.

Acts similar to the English one were passed for Scotland and Ireland in the session of 1868. The borough franchise for Scotland is substantially the same as for England, being conferred on every man who has for twelve months occupied, as owner or tenant, any dwelling within the borough, except he has been exempted from poor-rates on the ground of inability to pay, or has failed to pay. Scotland has also the £10 lodger franchise. In Scottish counties, proprietorship to the extent of £5 of clear yearly value confers a vote; the limit of the tenant franchise is £14. The Scottish act disfranchised seven English boroughs, and gave seven additional representatives to Scotland—two of these being assigned to the universities, and the rest to the larger towns and counties. The universities of Edinburgh and of St. Andrews return one member jointly; as do those of Glasgow and Aberdeen. The Irish act made no alteration in the county franchise, but reduced that of boroughs to a £4 rating occupation.

As thus chosen the house of commons was composed, in 1869, of the following representatives:

	Of Counties.	Cities and Boroughs.	Univer- sities.	Total.
England and Wales.....	187	297	5	489
Scotland.....	32	26	2	60
Ireland.....	64	37	2	103
United Kingdom.....	283	360	9	652

REFORMATION. The *reformation* denotes the great spiritual and ecclesiastical movement which took place in Europe in the 16th c., and as the result of which the national churches of Britain, of Denmark, Sweden, Norway, and Holland, and of many parts of Germany and Switzerland, became separated from the church of Rome. In other countries, such as Hungary and France, the same movement detached large por-

each), were divided into three parts, each represented by two members, which absorbed the other 18 seats.

* Birmingham, Leeds, Liverpool, Manchester, Merthyr-Tydvil, and Salford got each an additional member. The Tower Hamlets were subdivided, and got two additional members. Chelsea was made a borough, returning two members; and the following boroughs were appointed to return one each: Burnley, Darlington, Dewsbury, Gravesend, the Hartlepoons, Middlesborough, Staleybridge, Stockton, and Wednesbury.

tions of the population from the Roman Catholic faith, yet without leading to a national disruption with the papacy.

The causes of this movement were manifold; but, as may be supposed, they present themselves in very different lights to members of the different religious communions.

To Protestants, the reformation appears as the natural result of causes which had long been at work, and which it needed but a fitting occasion to call into active operation. The church of Rome had gradually, from the 6th c., or the time of Gregory the great, extended not merely its influence, but its direct control and government, over all the countries of western Europe—in many places, as in Ireland, Scotland, and part of England, displacing the old national churches, which had been planted in earlier times, and which had survived under comparatively simple forms of government. Although some uncertainty may exist as to the exact constitution, doctrine, and discipline of the old Scotch-Irish church, there can be no doubt that it did not acknowledge the direct superintendence of Rome, and that it was only after a long and varying struggle, not terminating till the 12th c., that the popes fully established their authority, and set up over this ancient church a completed hierarchy connected with Rome. It is only by keeping this in view that some features of the reformation can be clearly understood and appreciated.

The natural result of the wide-spread supremacy of the Roman church was, that the spiritual aspects of the church became gradually more and more merged in its mere machinery of external government. Everything that could give power and efficiency to it as an institute was carefully watched and nursed; but when, in the course of the 15th c., and even earlier, spiritual life began to die out in the center of this vast system of ecclesiastical government in Rome itself, the baleful effects of such spiritual decay speedily began to tell through all its borders. The growing corruption showed itself in many forms—in a prevailing ignorance among the monks and higher clergy; in the perversion of ecclesiastical offices, and especially in the grossly materialistic abuse of spiritual privileges and censures. The ignorance of the monks is depicted in strong colors in the satires of Erasmus and Buchanan, and in such books as the *Epistolæ Obscurorum Virorum*. The great impetus which the friars had given to the papal power in the 13th c. had died out. They had sunk, from being zealous and active preachers, into bigots and mendicants, cumbering the ground. The secular clergy were hardly less corrupted; in many cases the higher dignitaries of the church had no interest in the spiritual duties of their office, and gave themselves up entirely to the pleasures of a worldly life, or, at best, to the duties of political or military activity. The revival of the old classical literature in Italy—the spirit of what is called the *renaissance*—accelerated this movement of spiritual decay. The papacy itself became half-pagan. The church was little cared for even as an organ of government; it was used as an engine of self-aggrandizement and the most extravagant luxury.

These general causes, however, might have proved inefficient to produce any such radical change as the reformation; they had been long felt and deplored. Wycliffe in England, and Huss and Jerome of Prague had denounced, in the most vigorous manner, the prevalent abuses; they had excited a widespread popular interest, and even to some extent secured royal favor. But the overbearing power of the church proved too strong for the reforming spirit in its earlier manifestations. In the midst of his evangelical activity, Huss was betrayed, through the promise of a safe-conduct, into making his appearance at the council of Constance in 1414. No sooner was he fairly in the power of the council, than he was confronted with certain articles of abjuration; and refusing to submit without being convinced, he was, in defiance of the promise made to him, condemned to be burned as a heretic. The rising spirit of reformation was temporarily quenched in the flames which consumed the intrepid martyr of Bohemia. The council did nothing effectual to repair the abuses which he had denounced. The church remained apparently strong after a temporary excitement and alarm.

In the mean time, however, throughout the 15th c., new seeds of preparation for the great work were everywhere ripening. The literary movement begun in Italy was spreading in Germany, in England, and elsewhere. Reuchlin arose in Germany, Erasmus in Holland; England welcomed the latter as a student in the early reign of Henry VIII., while he was engaged in preparing his edition of the Greek New Testament. Various manifestations of spiritual life showed themselves, especially in the Rhine country. The brethren of the Common Lot took up in a more evangelical form the succession of the brethren of the Free Spirit, whose teaching had degenerated into a species of spiritualistic pantheism. Gerhard Groot and Thomas à Kempis represent this comparatively evangelical tendency, and springing from them, various men—the best known of whom is John Wessel of Gröningen—have been called “reformers before the reformation.” If we add to these influences the internal political agitations of the Germanic empire—whose traditional opposition to the papacy was by no means forgotten—the growth of a healthy political activity in many of the great municipalities of the empire, we shall find abundant incitements to the reformation in the social state of Europe, especially of Germany, and in the church in the beginning of the 16th c. It required only a definite spark to kindle the slumbering agitation, and this was not long wanting.

Whatever may be said of the doctrine of indulgences as theoretically stated, it is not denied by the most zealous defenders of the institution that it has at all times been liable

to the gravest abuse; and it so happened that at the period in question the abuse had risen to a scandalous height. See INDULGENCE. An agent of this system, of the name of Tetzel, a Dominican friar, came into Saxony in the year 1517, and established himself not far from Wittenberg, for the purpose of disposing of papal indulgences. He was a man of low and unscrupulous character, gifted with great volubility, and he carried on his traffic in a peculiarly offensive and shameless manner. Luther, who had been recently created a doctor in the Holy Scriptures, and entered upon his career as a teacher in the university of Wittenberg, was roused to indignation by what he heard of the doings of this man. He saw the evil influence of the system upon the members of his own flock, and determined to raise his voice against it. "God willing, I will heat a hole in his drum," he exclaimed, with reference to the coarse vehemence with which Tetzel commended the value of his wares. He posted on the door of the church of Wittenberg his famous 95 theses, and thereby created such a popular excitement that Tetzel was silenced, and obliged to retreat from the field. This was the beginning of the reformation in Germany. Luther's attention once aroused to the working of the papal system, he proceeded to examine it in different aspects, and the result was, that his resolution to assail it strengthened as he advanced. Neither cajoling nor threats, neither the bland softness of Cajetan, nor the blundering polemics of Eck, were of avail to silence him. A papal bull was at length fulminated against him; and he consummated his audacity by burning the bull at one of the gates of Wittenberg, on the memorable 18th Dec., 1520.

About the same time, and without any concert whatever, a similar movement against the sale of indulgences took place in Switzerland. In 1520 the Franciscan friars, who had the charge of promulgating the indulgences there, were opposed by Zwingli, a preacher in Zürich. His opinions were declared to be heretical by the two great universities of Cologne and Louvain; but he declared himself unmoved by the voice of Catholic authority; the magistrates and people of the city supported him; and the result was the active spread of the reforming spirit, not only throughout Zürich, but the neighboring cantons of Schaffhausen, Basel, and Bern.

In the mean time Luther advanced in his work. He addressed the "Christian nobles" of Germany, loudly declaring that the time to rise against Rome was come. "Talk of war against the Turk," he cried; "the Roman Turk is the fattest Turk in the world; Roman avarice the greatest thief that ever walked the earth; all goes into the Roman sack, which has no bottom, and all in the name of God too!" Step by step he opened his eyes to the errors of the papacy, and no sooner reached a new conviction himself, than he launched it forth into the world. He pronounced against the seven sacraments, in favor of only three—baptism, the Lord's supper, and penance. He contended for the use of the cup to the laity. His rapid writings—no fewer than three—in the same year, which he closed by burning the papal bull (1520), circulated in thousands, and were eagerly read. Nearly all Germany was aflame with the new spirit, and it seemed as if the empire would be wholly lost to the papacy.

The interposition of Charles V. produced at this crisis a temporary interruption in the progress of the reformation. Charles was crowned emperor of Germany in Jan., 1521, and immediately summoned at Worms a diet of the sovereigns and states of the empire. The papal leaders exerted themselves to have Luther summarily condemned at the diet. They succeeded so far as to make the emperor issue an edict for the destruction of the reformer's writings; but the estates refused to publish it unless Luther was allowed an opportunity of meeting his adversaries, under safe-conduct, and answering before the diet to the charges preferred against him. Luther was accordingly summoned to meet the assembled authorities of Germany at Worms. He gladly and proudly embraced the summons. His journey thitherward was a kind of triumphal procession, so enthusiastically did the people, and even some of the priests, greet him along the route. He is said to have entered Worms chanting "Ein feste Burg ist unser Gott"—the *Marseillaise* of the reformation, as has been remarked. The same night, however, the intrepid monk was heard in an agony of prayer in his room, overwhelmed by the solemnity of his circumstances. On the afternoon of the following day he made his appearance before the diet, and confronted its assembled statesmen and princes—a scene grand and striking in its features, which has been often painted. He was urged to retract; but he was immovable. In a speech, first in German, and then in Latin, he expressed his determination to abide by what he had written, and called upon the emperor and the states to take into consideration the evil condition of the church. lest God should visit the empire and German nation with his judgments. A direct answer was demanded from him whether he would retract or not. "I neither can nor dare retract anything," he replied, "unless convinced by reason and Scripture; my conscience is captive to God's Word, and it is neither safer nor right to go against conscience. There I take my stand. I can do no otherwise. So help me, God. Amen."

It was evident that Luther was not to be intimidated. He remained some days in Worms; but neither persuasion nor threatening availed with him. He received orders to depart; and in the end of April he set out on his way home. As he left Eisenach a few days afterward, and was passing through a narrow defile near the fortress of Altenstein, he was seized by two armed horsemen with attendants, carried to the neighboring castle of the Wartburg, and there lodged in safety. This apparently violent seizure was

the friendly act of his sovereign, Frederick of Saxony, to protect him from the destruction that his intrepid conduct was certain to have called down upon him had he remained at liberty. The ban of the empire had followed him, and temporary obscurity was his only safety.

The reformation suffered, however, from the absence of his guiding hand. Carlstadt and others, when left alone at Wittenberg, gave the rein to many excesses. Reform seemed likely to merge into license. The heart of Luther, after a year's residence in obscurity, was uncontrollably stirred within him to be at his old post again, directing and controlling the spirit of innovation; and he returned to Wittenberg in March, 1522. The lawless movement, however, which had received impulse, was not to be restrained. It broke out in many quarters. Social oppression and misery added to the flames of fanaticism. The peasantry rose in arms, headed by the Anabaptist M \ddot{u} nzer, and the horrors of a civil war raged throughout Germany. Luther exerted all his influence to stem the unhappy tide of affairs; exhorted the nobles on one hand, and the peasants on the other; and at no part of his career did he show a higher spirit and wisdom, although he has not always got the credit of this.

With his hands thus full of practical labor, he plunged at the same time into a violent controversy with Erasmus, which by no means reflected so much credit on him. Erasmus and he had hitherto, although in different ways, co-operated in the same cause; but they were men of such different spirit and temper, that a separation between them was inevitable. Luther had felt this for some time, but he was reluctant to come to an open breach. "Do not join your forces to our adversaries; publish no books against me, and I will publish none against you," he had said in a letter in 1524. On the publication, however, of Erasmus's treatise *De Libero Arbitrio*, Luther could no longer hold silence. He responded in the same year 1525, by his counter-treatise, *De Servo Arbitrio*; and the war of words waged hotly and vehemently between them. Luther was not only hearty but violent in denunciation; his indignation sunk into coarseness, while the audacity of his logic plunged him into unguarded and even unmoral paradoxes, which left him gravely open to the cold and telling sarcasms of his opponent. He was evidently himself little satisfied with the result, and even his warmest admirers cannot see much to admire in the spirit and zeal which he manifested on this occasion.

Hitherto the reformation had not received any legal establishment. Frederick of Saxony, while warmly protecting Luther and his followers, did not yet take any steps to displace Romanism by legal enactment, and set up in its stead a reformed church. This was now done, however, by Frederick's successor. He commissioned Luther and Melancthon to prepare a new form of church government and church service for his dominions. His example was followed by the other princes and states in Germany that had renounced the papal supremacy. The reformation thus obtained substantive existence and civil support. It was no longer merely a spiritual movement, it became henceforth also a political power. This important result showed itself conspicuously at the diet of Spire in 1526. An endeavor made at this diet to suppress the new religious movement, and to insist upon the rigorous execution of the papal sentence against Luther and his followers, was successfully opposed by a majority of the princes and representatives of states; and it was resolved, on the contrary, that the princes should have full power to order ecclesiastical affairs in their own dominions as they thought proper. This resolution served greatly to extend the reformation. The emperor was too busy for some years with his own affairs to be able to interfere with the course of events; and the reforming cause was in the mean time greatly strengthened and advanced in various states of Germany.

This period of progress and tranquillity, however, was soon interrupted. A new diet was convoked at the same place in 1529; and under the more powerful influence of the papal party, backed by the presence of the emperor's brother, who presided in the diet, the measures of the former diet were recalled, and all changes in religion declared to be unlawful except such as might be authorized by an approaching general council. It was then that the elector of Saxony, the landgrave of Hesse, and other princes of the empire who had already embraced the reformation, and established it in their dominions, made a solemn *protest* against the action of this diet—a circumstance which gave rise to the name of *Protestants*, which has since attached to all the followers of the reformation. See **PROTESTANT.**

While the reformation thus ran its course in Germany, and was adopted by the civil authorities in many states, it was making corresponding progress in Switzerland, and there at length also, after a famous and elaborate conference held at Bern in 1528, under the countenance of the civil authorities, the supremacy of the pope was abolished, and the reformed doctrines, in even a broader and more definite shape than in Germany, were declared to be the only doctrine of Scripture. Bern, Z \ddot{u} rich, and Basel continued to be the main centers of the reformed movement in Switzerland; but the reformed doctrines gradually extended throughout the great majority of the cantons. Chiefly those surrounding the lake of Lucerne remained, as they remain to this day, strongly attached to the Roman Catholic faith. The chief point of difference between the reformers in Switzerland and Germany concerned the doctrine of the eucharist. Luther, while abandoning the doctrine of a literal conversion of the bread of the eucharist into the body of Christ, known under the name transubstantiation, held to a modification of this doc-

trine, under the name of consubstantiation. The bread did not become the body of Christ literally, but it contained the body of Christ. Christ was in the bread as really "as the sword in the scabbard or the Holy Ghost in the dove." Zwingli, on the contrary, and his co-reformers in Switzerland, discarded all outward presence of Christ in the eucharist. The service, in their view, was merely memorial. "It is the spirit that quickeneth; the flesh profiteth nothing;" a passage which they applied to prove the worthlessness of any supposed eating of the body of Christ, even if such a thing were possible.

The dispute which arose on this subject between the reformers of Germany and Switzerland, and especially between their respective leaders, Luther and Zwingli, proved a serious impediment to the cause. Philip of Hesse sought to bring about a reconciliation between them. Zwingli, Bucer, and Oecolampadius met with Luther and Melancthon at Marburg in the year 1529, on his invitation, and held a long conference, but without any result. Luther was not to be moved in a matter which he held to be of the very essence of the Christian faith. The combatants separated with their opinions unchanged.

When Charles V. perceived the firmness of the Protestant princes in the position which they had taken up, he became anxious for temperate and conciliatory measures. In an interview with the pope at Bologna he urged, but without success, the necessity of a general council, and at the same time took means to convene personally with the princes at a new diet to be held at Augsburg. In the view of this important convention the reformers prepared, at the instance of the elector of Saxony, a statement of their special doctrines. The basis of this, the famous *Confession of Augsburg*, was 17 articles, delivered by Luther to the elector at Torgau, which had been adopted at a conference at Schwabach in 1529. These articles, enlarged and polished by the careful and moderate pen of Melancthon, were submitted in 28 chapters to the diet which met at Augsburg in June, 1530. Twenty-one chapters were occupied with the statement of the opinions of the reformers, and the remaining seven devoted to an exposure of the errors of popery. The reading of this confession by the chancellor of Saxony, in name of the Protestant states, made an earnest and favorable impression upon the diet. The papal authorities submitted a reply, which was approved by the emperor, and ordered by him to be accepted as a conclusion of the religious differences which had arisen. The Protestants responded instead by an answer to the papal document, which was afterward expanded by Melancthon, and published under the title of *Apology for the Confession of Augsburg*.

The religious schism between the emperor and many of the states of Germany seemed now approaching a crisis which could only terminate in war. A renewed decree, exceeding in severity that of Worms, was launched against the reformers. They on their part appreciated the solemnity of the crisis, and met, headed by the elector of Saxony, first at Smalkald, and then at Frankfort, in the years 1530 and 1531, when they entered into a treaty of defensive alliance, and encouraged each other in the resolution to maintain their religion and liberties against the threatened encroachments of the imperial edict. To Henry VIII. of England, who was at that time just beginning his own erratic career of reformation, they sent a special invitation to co-operate with them, on the basis of the doctrines of the *Confession of Augsburg*, an invitation to which he responded, but which issued in no practical result. The emperor, notwithstanding the strongly hostile attitude which he had assumed, was not prepared as yet to plunge into hostilities. The Turks were menacing the frontier of the empire; he had his own personal objects to gain in the advancement of his brother Ferdinand to the dignity of king of the Romans, an object which he could not accomplish without a majority of votes at an imperial diet. He was content, therefore, to enter anew into negotiations with the Protestant princes, and after many unavailing projects of reconciliation, a treaty of peace was concluded between them at Nuremberg in 1532. The Protestants agreed to support him against the Turks, and to acknowledge Ferdinand as king of the Romans; while the emperor in his turn agreed to abrogate the edicts of Worms and Augsburg, and allow the Protestants the free exercise of their religion until some settlement by a general council or a diet of the empire.

It was the emperor's necessities, and not his will, which consented to the peace of Nuremberg; there was no prospect, therefore, of its being lasting. But the Protestants availed themselves of their temporary repose to strengthen themselves and extend their power. The emperor continued to urge the pope to convoke a general council. At length, in 1536, Paul III. issued a summons for a council to meet at Mantua in the following year; but the duke of Mantua being disinclined to receive so many turbulent guests into his quiet city, the project did not take effect. In anticipation, however, and convinced that no council convened under the exclusive influence of the pope would deal fairly with the subject in dispute, the Protestants met at Smalkald in the year 1537, and while solemnly protesting against a mere Italian or papal council, at the same time agreed to a new summary of their doctrines, drawn up by Luther, to be presented to the assembled bishops. This summary is known under the name of the *Smalkald Articles*, and along with the *Confession of Augsburg* and the *Apology for the Confession*, constitutes to this day the doctrinal basis of the German Lutheran Church.

At length, in 1546, the same year in which Luther, worn out by his many toils, died somewhat suddenly at Eisleben, a council assembled at Trent. It was soon evident that no compromise was practicable between the Protestant and the papal party, and both

sides prepared to try the venture of war. When the council of Trent promulgated its decrees, and the reformed princes in the diet of Ratisbon protested against their authority, the emperor raised an army to compel their obedience. They, on their part, were ready with their forces, and marched into Bavaria against the emperor. The results, in the first instance, were severely disastrous to the Protestant cause, chiefly through the division of the princes, and especially the perfidy of Maurice, the nephew of the elector of Saxony. Various attempts at reconciliation and compromise were again attempted, in which Melancthon took a prominent part; but, as before, they came to nothing. A change of fortune gave a temporary triumph to the Protestant arms, and the result was that Charles concluded a formal treaty at Passau, in 1552, which may be considered the foundation of the Protestant liberties of Germany. The Protestants stipulated for the free exercise of their religion, until the meeting of a diet which should settle a permanent religious peace; and in return they agreed to lend assistance against the Turks, who were still menacing the frontiers of the empire. The promised diet assembled at Augsburg in 1555, and framed articles for the religious pacification of Germany, according to which all adherents of the Augsburg confession of faith were left in the undisturbed enjoyment of the rights which they had acquired, were freed from papal domination, and allowed to order their religious concerns as seemed best to them; Protestants and Catholics alike being bound to respect each others' convictions, and not to injure or persecute one another on account of religion, under penalty of being proceeded against as enemies of the empire. This treaty of Augsburg terminates the period of the reformation in Germany.

In the neighboring countries of Denmark and Sweden, the progress of reformed opinions had proceeded still more rapidly than in Germany. In both these countries, the sovereigns took the lead in enlightening their people, and freeing them from the tyranny of the church of Rome. In Sweden particularly, Gustavus Vasa showed both great courage and prudence in carrying out a reforming policy. He invited learned Lutheran teachers into his dominions, and showed special zeal in the circulation of a Swedish version of the Scriptures, made by one of these teachers, named Olaus Petri, who occupies the most prominent place among the Swedish reformers. At an assembly of the states at Westeraas, in 1527, while there reformers in Germany were still struggling for bare existence, it was unanimously resolved that the Lutheran doctrines should be adopted in Sweden, and a Reformed church, entirely independent of Rome, established. The same result occurred in Denmark in 1539, when an assembly of the Danish states at Odensee gave formal sanction to a plan of religious doctrine, worship, and discipline, drawn up by Bugenhagen, a disciple and friend of Luther, whom Christian III. had invited from Wittenberg for the purpose.

In France the progress of the reformation was of a much more uncertain and wavering character. As early as 1523 the new doctrines had spread greatly in many parts of France, under the countenance of Margaret, queen of Navarre, sister of Francis I., the constant rival of Charles V. The names chiefly associated with this early phase of the French reformation, besides that of Margaret herself, are those of Lefevre and Farel, the latter particularly a man of active and fiery zeal, who had been originally a priest in Dauphiné, and whom we find subsequently associated with Calvin in Geneva. The university of Paris became for a time strongly infected with the "new learning," and many of the nobility, as well as the people, were actually inclined to throw aside the superstitions of Rome, and embrace a more scriptural form of faith. But the violent and inconsistent policy of Francis I., and the fierce spirit of faction which the struggle engendered, gave an unhappy turn to the course of events in France, and prevented the reformation from obtaining in that country anything of the same national recognition that it obtained in Germany and elsewhere. Both Farel and Calvin were driven by the violence of persecution into Switzerland. The latter settled for a time at Basel, where he completed and published the first edition of his *Institutes*. The famous preface, addressed to Francis I., bears the date of Basel, Aug. 1, 1535. In the following year he repaired to Geneva, where Farel, already laboring in the work of the reformation, retained him by a "divine menace," and he began that great career as a reformer, theologian, and legislator which has rendered his name so illustrious.

In Spain and in Italy the spread of the reformation, which in both countries had taken an active and hopeful start, was almost entirely suppressed by the power of the inquisition. The church of Rome was able to bring its whole force to bear upon these countries, unchecked by political hostility. The flames of martyrdom, which elsewhere seemed to kindle a double zeal for the cause which they aimed to destroy, were here kept burning with such an incessant and devouring cruelty, as to consume all life out of the new movement, and brand the name of Protestant with the infamy which, in the popular mind, always attaches itself to hopeless failure.

The same policy was attempted in the Netherlands. Upwards of 100,000 of the inhabitants are said to have fallen under the atrocious cruelty of Charles V. and his son, Philip II. But the spirit of political freedom and moral earnestness proved at length an equal and finally, through a protracted and bloody conflict, a victorious match for the blood-thirstiness even of Philip and Alva; and the principles of the reformation, after a Calvinistic type, were at length established in the United Provinces, along with the political supremacy of the house of Orange.

The reformation in England is marked by peculiar features—an under-current of

popular movement, dating even from the time of Wycliffe, and a somewhat inconsistent and wavering series of political changes during the reigns of the three Tudor princes, Henry VIII., Edward VI., and Elizabeth. In the beginning of the 16th c., as early as the first movements of Luther, there are indications of a revival of evangelical religious life among the tradesmen of London, and the peasantry in different parts of the country, particularly in Lincolnshire. The popular mind had begun to look with suspicion and ridicule upon some of the most characteristic doctrines of Romanism. A story is told by Foxe of a Lincolnshire peasant, busy thrashing his corn in his barn, accosted by a neighbor. "Good-morrow, you are hard at work." "Yes," replied the man, in allusion to the doctrine of transubstantiation, "I am thrashing God Almighty out of the straw." The residence of Erasmus in England, in the beginning of the reign of Henry VIII., stimulated a spirit of biblical inquiry among the educated classes, which, while it remained for the most part faithful to the church of Rome, as in the case of More and others, yet helped to advance a reforming movement. The study of his Greek Testament was eagerly entered upon by a few students at both universities, especially at Cambridge. We find Billing, Tyndale, and Frith associated at the latter place in 1520; and in the decade following, Cranmer, Ridley, and Latimer all come into prominent notice. It is at the end of this latter period—the year 1529—a year before the meeting of the diet of Augsburg in Germany, that the reformation in England may be said to take its first decided advance. In this year the usurpations of the clergy, and the manifold ecclesiastical abuses prevailing in the country, were the subject of parliamentary legislation. The negotiations as to Henry's divorce from Catharine had been proceeding for some time, and the country was greatly excited by the course of events. In 1533 Henry was married to Anne Boleyn, and his former marriage with Catharine declared void. All appeals to Rome were forbidden. In the two following years the sovereign was declared to be the supreme head of the church of England, with authority to redress all errors, heresies, and abuses in the church; the monasteries were dissolved; and parliament petitioned that a new translation of the Scriptures might be authorized and set up in churches. In all this course of reformation, however, there was but little religious impulse on Henry's part, for we find him again, in 1539, yielding violently to the spirit of reaction, and passing the famous statute known as the six articles, which rendered it penal to deny the doctrine of transubstantiation, or to affirm that priests might marry. Cranmer, who had been for some years archbishop of Canterbury, labored to prevent their passing; and Latimer resigned his bishopric as soon as they were confirmed.

With the accession of Edward VI., in 1547, the reformation greatly advanced. The statute of the six articles was repealed, with other reactionary measures of the close of Henry's reign. The parliament of 1548 established the use of the book of common prayer; the clergy were permitted to marry; the cup was allowed to the laity; and in 1551 the 42 articles of religious belief, afterward reduced to 39, were promulgated. The temporary restoration of popery under Mary, and the final establishment of Anglican Protestantism under Elizabeth, are well-known events, belonging to the special history of these reigns.

In Scotland the reforming impulses began with Patrick Hamilton about the same time that Cranmer and Latimer first appear active in England. Hamilton was educated in Paris and in Germany, and learned there the doctrines which he introduced into his native country. There was something, indeed, of the same popular movement, known under the name of Lollardism in Scotland, as in England, and Hamilton's preaching may have served to kindle up the dying embers of this movement. His early death, in 1528, undoubtedly produced a great effect. "Men began," says Knox, "very liberally to speak." "The reik of Mr. Patrick Hamilton infected as many as it did blow upon." After Hamilton, George Wishart appears as the next hero-martyr of the Scottish reformation; and in connection with him—as his reverend disciple and companion—we first hear of John Knox, who became finally the great leading spirit of the movement, by whose influence popery was extirpated, and the reformation established in Scotland in 1560. The Scottish reformation followed the type of the Calvinistic reformation in Geneva, where Knox had taken refuge during the period of persecution in Scotland, and acted for some years as the companion of Calvin. Episcopacy was abolished, and the fabric of the reformed kirk set up in every respect as far as possible in opposition to the papal system, which had become the opprobrium of the people.—*Ranke's History of the Reformation in Germany*; D'Aubigné's *History of the Reformation*; Waddington's *History of the Reformation*.

Such is the light in which this great religious revolution presents itself to the Protestant. Catholic students naturally regard it very differently; and although the name REFORMATION has come to be generally adopted as the historical designation of the religious movement of the 16th c., this name is only accepted by Catholics under protest, and as a conventional phrase, the rigorous meaning of which they distinctly repudiate. The more strict writers among Catholics employ in its stead the name "pseudo-reformation," or "so-called reformation."

As regards the event itself, Roman Catholics, while they admit that many abuses existed in the church which called for reform, and many superstitions existed which deformed the true character of religion among the ignorant masses of the people, con-

tend nevertheless not only that the extent and the nature of these abuses and superstitions are greatly exaggerated, but also that the task of reforming them did not imply either the necessity or the lawfulness of a separation from the church. They assert that the conduct and character of many of those who were most prominently engaged in the movement prove them to have been influenced by corrupt and unworthy motives; that in their effort to throw off the obedience of Rome, they rather sought emancipation from moral and disciplinary restraint, than the purification of the religious system of the church; that the change in many of the countries in which it was effected was brought about mainly through the agency of the sovereign, with a view to the appropriation of the revenues of the church; and that in others it was brought about by appealing to the prejudices of excited and unreasoning multitudes, who were taught to confound the system with its abuses, and who were incapable of distinguishing the true doctrine of the church from the superstitions which were justly held up for reprobation. And thus in the view of Catholics, the true REFORMATION of the church was not that which has been described above, as carried out by the seceders of the 16th c., but that internal change which was effected by the decrees of the council of Trent, and by the religious revival which took place simultaneously with the sittings of that assembly. They dwell much on the fact, that all the notable successes of Protestantism were at its first origin, and that, in the words of lord Macaulay, if Protestantism had at its first onset "driven Catholicism to the Alps and Pyrenees," so Catholicism, in its turn, "rallied and drove back Protestantism even to the German ocean."

As to the moral and religious results of the reformation, the same difference of opinion exists. That the very necessity of action which it created had a beneficial influence on their own church, by the internal revival to which it led, Catholics freely admit; but they look upon the revolt against authority, the inauguration of religious innovation and skepticism, the separation from the church, and the disruption of Christian unity, as fraught with moral and intellectual evil; and a work of much learning has been devoted, by the well-known Catholic theologian, Dr. Döllinger (q. v.), to establishing this point by the confessions of the first reformers themselves, and their immediate successors. See *Die Reformation, ihre innere Entwicklung und ihre Wirkungen*, von J. Döllinger (3 vols. Svo, Regensburg, 1848).

REFORMATORY SCHOOLS. The first institution to which queen Victoria gave her name was a reformatory for girls, established at Chiswick in 1834, under the name of the Victoria asylum. It was the first of its kind in England; but as early as 1788, the germ of the reformatory movement may be traced in the working of the Philanthropic society, which established a sort of farm-school, on the family system, for the reformation of depraved and vagrant children. A second school was established at Warwickshire in 1818, but was suffered to die for want of support, as was the third, set on foot by capt. Brenton in 1830. Capt. Brenton was the first who took his stand on the principle, that no child under 16 should be sent to prison, but to some place where training might be provided in industry and virtue; and the girls' school at Chiswick originated in his influence, and was worked on his plans. On his death in 1839, reformatory efforts ceased for several years in England—the institution of the Philanthropic society at St. George's in the fields being a mere refuge for the destitute. But its chaplain was the rev. Sydney Turner, since the well-known inspector of prisons and reformatories, and his attention was directed to the reformatory movement abroad, where its principles were flourishing in the school of Mettray (q. v.), founded in 1839, and the Rauh's Haus (q. v.) at Hamburg. In 1847 the St. George's institution restricted its care to boys charged with or convicted of crime; and at length, in 1850, broke up and removed to Redhill, establishing there, on the family system, the greatest reformatory in England. From this time the progress was rapid and sure. In 1852 several schools were opened: Hardwicke court by Mr. Baker; Kingswood, by Miss Carpenter; Stoke farm, by Mr. Joseph Sturge; and Saltley, near Birmingham, by Mr. Adderley. Government then determined to legalize the system. Three parliamentary committees having pronounced against the imprisonment of children, the reformatory schools act, 17 and 18 Vict., was passed in 1854, followed by amending acts in the three succeeding years. One of the first principles of the movement was voluntary agency, and this agency was still retained. The act sets out in its preamble, "that whereas reformatory schools have been, and may be established by voluntary agency in various parts of the country, it is expedient that more extensive use should be made of these institutions." The state certifies the school to be fit for its purpose; provides that, on conviction, after a short imprisonment, not more, generally, than 14 days, the child shall enter the school, and remain for a term of years, under the sole management of its conductors, paid for by the treasury at the fixed rate of 6s. per week. A portion of this is recoverable from the parents, if they are in a condition to contribute to the child's support. Counties and boroughs may furnish from their funds money to aid in the establishment of reformatory schools. The results of the schools have been regularly presented to the public in the reports of her majesty's inspector, who has often traced to their operation the late marked decline in juvenile delinquency, which was previously rapidly increasing. By the end of 1856, 34 schools were in existence; 11 were added in 1857; and in 1860, the number in Great Britain was 59. At the close of 1877 there were in England 54, and in Scotland 12 reformatories. The number of inmates

(including those out on trial) was 6,665 in 1875, 6,614 in 1876, 6,853 in 1877 (being 5,935 actual inmates). The total amount of money expended in the year 1877 on these important institutions was £139,825. The average cost per head for food and clothing was: English boys' schools, food, £8 1s. 3d.; clothing, £2 9s. 5d.; English girl's schools, food, £7 12s. 10d.; clothing, £2 0s. 8d.; Scotch boys' schools, food, £7 9s. 2d.; clothing, £2 9s. 7d.; Scotch girls' schools, food, £6 12s. 10d.; clothing, £1 19s. The education commission said of these schools: "Upon the whole, none of the institutions connected with education appear to be in a more satisfactory condition." It has, however, been urged that children should not be sentenced to reformatories on a first conviction, as it was becoming the rule to do, and that all children under 12 should be sentenced to an industrial (q. v.) school instead. See JUVENILE OFFENDERS.

REFORMED CHURCHES, a term employed in what may be called a conventional sense, not to designate all the churches of the reformation, but those in which the Calvinistic doctrines and still more the Calvinistic polity prevail, in contradistinction to the Lutheran (q. v.). The influence of Calvin proved more powerful than that of Zwingli, which, however, no doubt considerably modified the views prevalent in many of these churches. The reformed churches are very generally known on the continent of Europe as the *Calvinistic churches*, while the name *Protestant church* is in some countries almost equivalent to that of *Lutheran*. One chief distinction of all the reformed churches is their doctrine of the sacrament of the Lord's supper, characterized by the utter rejection not only of transubstantiation, but of consubstantiation; and it was on this point, mainly, that the controversy between the Lutherans and the Reformed was long carried on. See LORD'S SUPPER and SACRAMENTARIAN CONTROVERSY. They are also unanimous in their rejection of the use of images, and of many ceremonies which the Lutherans have thought it proper to retain. Among the Reformed churches are those both of England and Scotland, notwithstanding the Episcopalian government of the former; the Protestant church of France, that of the Netherlands, many German churches, the Protestant churches of Hungary, Poland, etc., with those in America which have sprung from them.

REFORMED CHURCH IN AMERICA (Dutch), formerly called "the Reformed Protestant Dutch church in North America," is a body of Christians in the United States composed primarily of descendants of settlers from Holland. They claim the honor of establishing the first Protestant church organization, the first day-school, and the first theological seminary, on this continent. The mother church began her existence in the Netherlands toward the end of the 15th c., the scattered congregations meeting in secret under the ban of the government and inquisition, and calling themselves "the Churches of the Netherlands under the Cross." Two earnest students of the Greek New Testament, both natives of Groningen, Gansevoort and Agricola, may be called the heralds of the reformation in Holland; which, as Motley says, "entered through the Huguenot gate." The "Belgic confession," based on that of the Calvinistic churches of France, was published in 1531, and adopted by the synod of Antwerp in 1563, and at Wesel in 1568. The conflict with Philip II. was precipitated in 1563, and the long pent-up convictions of the people burst into flame. Open-air preaching and the singing of hymns in the vernacular fired the hearts of the masses. The scattered churches now formed themselves into one organization, adopting the designation of "a lily among thorns." During the heroic struggle for liberty, and amid fierce persecutions, the reformed faith became the religion of the state, the "union of the seven provinces" dating from 1579. In gratitude to William, prince of Orange, the Reformed church adopted his coat-of-arms as their distinctive blazon, adding to the original Dutch motto *Eendracht maakt macht* (unity makes strength), the text "*Nisi Dominus frustra.*" The national church of Holland now took its place among the churches of the continent, its faith being "protestant" as opposed to the pope's rule; and "reformed" as distinct from Lutheranism. The Reformed church of Holland, of s. Africa, and in the Dutch colonies throughout the world, is still flourishing, the most striking event in its history being the session of the synod of Dordrecht (or Dort), in 1619, to settle the controversy between the Calvinists and Arminians; and the translation of the states-general's version of the Bible, in 1637, at a cost of \$100,000, which is still the standard Dutch version.

The Reformed church in America was organized in 1628, in what is now the lower part of New York city, by the rev. Jonas Michaelius. Hendricks Hudson sailed up the Hudson river in 1609; a trading-post was established by Hollanders on Manhattan island in 1614, and an agricultural settlement in New Netherlands in 1623. The colonists, although without a clergyman, enjoyed in 1626 public worship and the pastoral services of two *krank-besoekers* (comforters of the sick) who were lay church officers and empowered to conduct services in the absence of a minister. In the summer of 1628, the rev. Jonas Michaelius arrived, and at once organized a church, with a consistory, there being fifty communicants present at the first celebration of the Lord's supper. This is now the Collegiate Reformed church in New York city. In 1633 the rev. Everardus Bogardus arrived to succeed Michaelius, and with him came the schoolmaster Adam Roelandsen, who founded the present flourishing Collegiate Church parochial school, now in its 249th year of successful operation. The wife of the "dominie" (or pastor) Bogardus was Annetje Jansen (Anneke Jans), whose farm, then lying in the suburbs of the settlement, has

become the property of Trinity church. See BOGARDUS, EVERARDUS. At the time of the English conquest in 1664 there were seven reformed churches in the country. These were at New York, Albany, Kingston; Flatbush and Flatlands, on Long Island; Bergen, N. J., and New Amstel, Del.; the Hollanders numbering in all probably less than 10,000. These 50 years, from 1614 to 1664, form the first period of this church's history. The second period, marked by struggles with the English governors, who wished to impose the language and ecclesiastical customs and rules of England upon the Hollanders, lasted from 1664 to 1737. During this time the number of churches increased to sixty. Colonies of Huguenots from France, and many thousands of Germans from the Palatinate, arrived in America and connected themselves with the Reformed church; which, as the line of distinction between the English and Hollanders became more definite through their resistance of official interference, was called the "Reformed Protestant Dutch church." The first use of this name was in a charter given by William III to the church at New York, in 1694. The lines of the Dutch churches extended mainly along the Hudson, Mohawk, and Raritan valleys, and on Long and Staten islands. Emigration from Holland had almost wholly ceased. Most of the ministers, however, came from Holland, and the classis of Amsterdam in the old country was the superior judicatory. In 1737 the American Dutchmen formed a "coetus" or ecclesiastical body in New York, which applied for permission to hold an annual synod for ecclesiastical business only, subject to the approval of the classis of Amsterdam. With proverbial Dutch slowness, the permission was granted after a delay of nine years. Even then, the measure of power granted was too small to render effective the operations of the yearly conference of lay and clerical delegates. In 1755, through the influence of the more progressive spirits, the first American classis was formed. This was the signal for sixteen years of bitter strife between the adherents of the *coetus* or progressives, and the *conferentie* or conservatives. The peace-maker who finally healed the long strife was the rev. John H. Livingston, a graduate of Yale college, who went to Utrecht for theological study. In 1771 he presented a plan of union to the churches assembled in convention at New York, which being accepted by the classis of Amsterdam and the American Dutch churches, the way was made clear for the present ecclesiastical organization.

In 1792 the constitution of the church, based on the articles of church government in Holland, was formed. About this time the German churches in New York, Pennsylvania, and the south, which had been under the care of the classis of Amsterdam, assumed the right of self-government, some of them remaining with the Dutch churches, others forming "The German Reformed church." See REFORMED CHURCH IN THE UNITED STATES. The statistics of the Reformed Dutch church at that time give 1 general synod, 5 classes, 130 churches, and 50 ministers. The English language was used in but few churches until long after the revolutionary war, which fact alone would explain why this oldest of the Presbyterian churches in America is among the smallest. The first preaching in English in 1764 by rev. A. Laidlie in New York caused a law-suit between parties in the church, and began a still longer strife. The young people in the cities were thus largely lost to the church, while emigration added nothing, until the years 1846 and 1847, and the years following, when a fresh influx of Hollanders to our shores greatly added to the strength of the Reformed church in Iowa, Michigan, and Wisconsin, leaving, however, a geographical break between the churches east and west, now but partly filled. The Holland tongue is still used in many of these latter churches.

The theological standards are identical with those of the Reformed church of Holland, viz.: The Belgic confession, the Heidelberg catechism, the canons of the synod of Dort; the prevailing type of doctrine being that of moderate Calvinism. In government, the church is strictly Presbyterian; in worship, semi-liturgical. The liturgy, the use of which is optional, and which is but partly used in most of the churches, was first adopted by the synod of Wesel in 1568, modified in 1619, and translated into English in 1767. It is part of the constitution of the church. The use of the forms for the administration of baptism and the Lord's supper, for ordination of ministers, elders, and deacons, for excommunication and readmission of excommunicated members, are obligatory upon every minister. Those for the litany and prayers, marriage and burial service, laying of corner-stones, for opening and closing of consistory, are optional, and, except in the case of the litany and prayers, largely in use. Formerly the clerk, who was also precentor (*voorzitter en voorzanger*), stood in the desk below the pulpit, read the commandments and creed, and gave out and led the singing of the psalms, the minister in gown and bands entering the pulpit during the first singing. At his side, on the pulpit, was an hour-glass, to measure the length of the discourse, which ought not to exceed one hour. English hymns were first sung in 1767. Four officers are recognized in the constitution: ministers of the word, teachers of theology, elders, deacons. The judicatories are the consistory, classis, particular synod, general synod. The consistory of each church is composed of minister, elders, and deacons; the elders being charged with spiritual functions, the deacons having care of the poor. Usually the consistory are sole trustees of the church-property. The elders are elected not for life, but by the male communicants for two years; this rotation in office changing half of the consistory each year. The great consistory is an advisory body composed of all elders and deacons who have been in-office. Elders and deacons, like ministers, are considered as bound to the sanc-

tuary for life, though not always in office. The classis is composed of not less than three elders and three ministers from at least three churches, and holds meetings semi-annually. The classes preside over the churches, license, ordain, install, dismiss, suspend, and depose ministers, examine minutes of consistories, and try cases of appeal from the latter. The particular synod presides over the classes, forms new ones, transfers congregations from one to another, and decides cases of appeal from them. It meets once a year, and is composed of four elders and four ministers from each classis. The general synod supervises the whole church. It meets once a year in June. Three ministers and three elders from each classis form this body, which is the final court of appeal, which cannot, however, change the constitution. Such a change can come only by a majority of the classes. In 1880 there were 1 general and 4 particular synods, 33 classes, 510 churches, 545 ministers, 43,289 families, 80,208 communicants, 645 Sunday-schools having 80,445 scholars; \$171,614 $\frac{47}{100}$ were raised for benevolent and \$852,286 $\frac{53}{100}$ for congregational purposes.

The educational institutions are Rutgers college at New Brunswick, N. J., founded in 1770, well endowed and equipped; Hope college at Holland, Mich., chartered in 1866; and the theological seminary at New Brunswick, N. J., founded in 1784. Union college was founded and first endowed by the Dutch church at Schenectady, N. Y. The boards, which are under the control of general synod, have charge of foreign missions, home missions, education, and publication; with funds for widows and orphans, disabled ministers, and church building. In missionary work, preaching among the Indians was begun by Dominie Megapolensis at Albany, three years before John Eliot held his first service. The old records of the churches at Schenectady, Albany, and New Jersey contained the names of hundreds of baptized Christian Indians who were members of those churches; and the translations of the Scriptures, Christian doctrine and ritual into the Indian languages, especially the Mohawk, still attest the missionary spirit of the early Dutch pastors and people in America, which was continued in, or directly by, the church among the Indians settled on reservations, until 1830. Missionary work in Asia was begun at first in co-operation with other societies. After contributions made during many years, the first band of missionaries was in 1836 sent out to India, and thence to Borneo. In 1858 independent denominational effort was inaugurated. The China mission was begun in 1844; the Arcot, India, in 1854; and the Japan in 1859; the names of Scudder, Abeel, Talmage, Van Dyck, Brown, Verbeck, being prominent in the annals of the Reformed missions. The statistics of the work for 1880 are: stations 14, out-stations 101, missionaries 16, assistants 21, native pastors 11, catechists, readers, helpers, etc., 133, churches 35, members 2,341, academies and schools 52, scholars 1741, native contributions \$2,251. The appropriations of the board for 1880 were \$74,279. The board of home missions, to whose fostering care half the churches of the denomination owe their existence, began work in 1849, and has had a large field of enterprise among the Hollanders and other people of the west. It disbursed in 1880 \$34,527. The board of education assists indigent young men preparing for the ministry, and aids parochial schools under its care. In 1880 it expended \$20,594, and aided 72 students, the allowance to each being \$150 per annum. The expenditures of the other boards and funds for 1880 were: publications, \$21,010; church building, \$7,139; widows and disabled ministers, \$6,098. The Reformed church corresponds by delegate or letter with a number of evangelical Christian bodies in the United States, Europe, and south Africa. The *Christian Intelligencer*, weekly, and *The Sober and Mission Monthly*, are denominational periodicals published in New York. See the *Manual of the Reformed Church in America*—a nearly complete biography of the ministers, with bibliography, and history of the church (3 vol. ed., 1879); *Manual of Missions*, (1877); *Constitution and Digest of Acts of General Synod*; *The Dutch Reformation*; *Centennial Discourses*, (1876); *History and Characteristics of the Reformed Dutch Church*—all published in New York; also, *Documentary History*; and Brodhead's *History*, New York; *Two Hundred Years of Church Life* (Schenectady, 1880); and *Quarter-millennial Anniversary of the Reformed Protestant Dutch Church of the City of New York* (1878).

REFORMED CHURCH IN THE UNITED STATES (GERMAN) was founded by emigrants from those provinces of Germany in which the Reformed church prevailed. Driven by persecution at home and encouraged by William Penn's offered gift of land, a large number of them settled in Pennsylvania in the early part of the 18th century. Their first minister was rev. George M. Weiss, who, with 400 members, settled in Montgomery co., where a congregation was organized and a church built—the first of the denomination in America. Every year the number of emigrants increased, not only from Germany, but also from other states of Europe. Some of them settled in New York, New Jersey, Maryland, Virginia, and Carolina; but the larger portion went to Pennsylvania, east of the Susquehanna. They were destitute of ministers, organized churches, and teachers, and, in a great degree, of books. Poor at first, they were industrious, prudent, and moral, so that their temporal and social condition gradually improved. The formative period of the church began in 1746, when rev. Michael Schlatter, a Reformed minister from St. Gael, Switzerland, was sent to labor in America. He visited nearly all the German settlements, preaching, organizing churches, settling pastors, and establishing schools. In 1747 he organized the first synod. He then visited Europe to solicit aid, and having traveled through Holland, Switzerland, Germany, and

England, obtained a large fund, the interest of which was devoted to the support of ministers and teachers in America, and to purchase Bibles for distribution among the people. He also persuaded some young ministers to emigrate to America, five of whom went back with him. The church retained a position subordinate to the church of Holland for 46 years, during which time emigration increased, but the spiritual destitution continued. For 150 churches, there were not more than 22 ordained ministers. In 1793 the synod assumed the right to govern itself, and to have the sole care of their churches in America. The succeeding period of 30 years is not easy to describe. The people increased in numbers and wealth. Congregations multiplied. Many Germans went westward, and churches were planted in Ohio. The ministers also increased in number, from 22 to 82. But the standard of education among them was lowered. Instead of graduates from the universities of Europe, a majority of the young ministers were from the American church, and of imperfect education. And with the want of learning there came also an ignorance of its value. Ecclesiastical disorder also followed; laymen sometimes administered the sacraments, and some ministers were disposed, as individuals, to ordain men on their own judgment. The influence of rationalism in Germany and of deism in England was disastrous. But the reaction in Germany extended also to this country, and the revival of faith increased in power. After a struggle of seven years, the theological seminary was commenced at Carlisle in 1825; was removed to York, 1829; to Mercersburg, 1835; and continued there until removed to Lancaster, 1871. The establishment of this seminary and of Marshall college in connection with it, marks a new epoch in the progress of the church. The standard of ministerial qualification was raised, the number of students enlarged, and a spirit of philosophic thought evoked which has produced a distinct and much-controverted movement in theology and church life. See MERCERSBURG THEOLOGY. The education thus provided supplied the means for introducing worship and preaching in the English language; and from 1825 to the present time, amid much opposition, that change has been progressing. In 1879 a declaration of faith was prepared, designed as a settlement of differences in the church, and setting forth the Heidelberg catechism, in its historical sense, as the standard of doctrine. In that year, according to official reports, the church contained 6 synods, 45 classes, 714 ministers, 1374 congregations, 151,761 communicants, and 91,637 members not confirmed. The amount of contributions reported was \$586,481.

REFORMED EPISCOPAL CHURCH, organized in New York city, Dec. 2, 1873, with 8 clergymen and 20 laymen, all of whom had been or were at the time ministers and laymen in the Protestant Episcopal church identified with the "evangelical" or "low church" party. One of them, George David Cummins, D.D., had been assistant bishop of the diocese of Kentucky until Nov. 10, 1873, when by letter to the presiding bishop he resigned his office and withdrew from the denomination. He became the bishop of the new organization: the rev. Charles Edward Cheney of Chicago was also elected bishop, and consecrated on a subsequent day. The following statement, condensed from the declaration of principles adopted at the organization, explains in the briefest form possible the doctrines held and the reasons assigned for adding a new denomination to the many already existing: I. The Reformed Episcopal church declares its belief in the holy scriptures of the Old and New Testaments as the word of God and the sole rule of faith and practice; in the apostles' creed; in the divine institution of the sacraments of baptism and the Lord's supper; and in the doctrines of grace substantially as they are set forth in the 39 articles of religion. II. It recognizes and adheres to episcopacy, not as of divine right, but as a very ancient and desirable form of church polity. III. Retaining a liturgy, not imperative or repressive of freedom in prayer, it accepts the book of common prayer as it was revised, proposed, and recommended for use by the general convention of the Protestant Episcopal church 1785; reserving the right to make alterations in it, provided that the substance of faith be kept entire. IV. It condemns and rejects the following doctrines as contrary to the word of God: 1. That the church of Christ exists only in one form of ecclesiastical polity. 2. That Christian ministers are "priests" in another sense than that in which all believers "are a royal priesthood." 3. That the Lord's table is an altar on which an oblation of the body and blood of Christ is offered anew to the Father. 4. That the presence of Christ in the Lord's supper is a presence in the elements of bread and wine. 5. That regeneration is inseparably connected with baptism.

The foundations of the University of the West have been laid at Chicago, near which a landed estate of great prospective value has been given to this church by Edward Martin of New York. At present only the Martin college of theology is in operation. At the seventh general council, Chicago, 1879, there were reported as belonging to the denomination: 6 bishops; 70 presbyters; 24 deacons; 70 parishes; 5,800 communicants, of whom 400 were added by confirmation, and 900 were otherwise received; nearly 800 Sunday-school teachers and 8,000 scholars; contributions for church and benevolent work, \$128,000.

REFORMED PRESBYTERIANS (CAMERONIANS, *ante*) were found in Pennsylvania 1743, at which time they met at Middle Octorara, and renewed their subscription to the old Scottish "covenant." In 1752 the rev. John Cuthbertson, sent over by the church of Scotland, became their minister, and in 1774, in connection with the rev.

Messrs. Linn and Dobbin from the Reformed presbytery of Ireland, constituted the Reformed presbytery of this country. In 1782 these ministers and a part of their people united with the Associate church in forming the Associate Reformed church. In 1793 they organized a presbytery at Philadelphia, which, having in 1800 the question of slavery forced on its consideration, declared that no slaveholder should be allowed to remain in communion with it. In 1807 it opened a theological seminary at Philadelphia; and in 1809 resolved itself into a synod containing three presbyteries. Holding that the church and the state are the two leading departments of Christ's visible kingdom on earth, they will not take a civil oath nor do any other act which implies full allegiance to the state. After the war of 1812 this peculiarity occasioned much debate among themselves, and led in 1833 to the formation of an independent synod by the more liberal-minded minority. The majority, made more homogeneous by the secession, now enforced their principles more rigidly. They neither become nor act as American citizens; do not vote at political elections, or enlist in the army, or accept civil stations, or serve as jurors, or in any way personally recognize the political system of the United States. Their theological seminary, organized in 1840, is established at Allegheny City, Penn., and has a faculty of three professors. The synod has several missions in foreign lands, one of which is at Latakiah, Syria. In 1877 the reported missionary and other benevolent contributions amounted to \$45,000. The minority at the separation in 1833 is officially styled the general synod of the Reformed Presbyterian church, but is popularly called the New Light Covenanting church. Maintaining strictly the other principles of Covenanters, its members recognize their duties and embrace their privileges as citizens. Within a few years it has been weakened by the withdrawal of a part of its ministers and churches. The old theological seminary in Philadelphia is in connection with this portion of the denomination.

REFORMED PRESBYTERIANS. See CAMERONIANS.

REFRACTION. See DIOPTRICS; HEAT; REFRACTION, DOUBLE; UNDULATORY THEORY. In the articles referred to, the ordinary experimental laws of single and double refraction are stated; geometrical consequences, such as the mode of action of lenses, prisms, telescopes, and microscopes, are deduced from them; and the connection of these laws with the hypothesis of undulations is explained.

It remains that we should give the refractive and dispersive powers of a few common substances, to show the great diversity which exists among them, especially in the non-proportionality of dispersion to refraction. The following results are due to Fraunhofer, who was the first to employ, for this purpose, Wollaston's discovery of the *fixed lines* in the spectrum (q. v.), without whose aid all such observations are of comparatively little value. The lines B, D, and H, which we have selected for the table, correspond to definite rays of red, orange, and violet respectively:

Substance.	Refractive Index.			Dispersion. (H—B).
	B.	D.	H.	
Flint Glass.....	1.6277	1.6350	1.6710	0.0433
Crown Glass.....	1.5253	1.5296	1.5466	0.0207
Water.....	1.3310	1.3356	1.3442	0.0132
Turpentine.....	1.4705	1.4744	1.4939	0.0234

The numbers in the last column roughly show how far the red and violet are separated by prisms (of a given angle) of the various substances; and even this brief list shows how erroneous was Newton's idea that dispersion is proportional to refraction, an idea which led him to the conclusion that an achromatic (q. v.) combination was impossible.

Thus we see that the refractive indices of flint and crown glass are (approximately) as 16:15, while the dispersive power of flint is more than double that of crown. Hence, if we construct prisms of the two materials, such that the angular separation of red and violet, which they produce, shall be equal, the angle of the flint will be far less than that of the crown, and the whole refraction also less. The combination of two such prisms, with their edges turned opposite ways, will thus bend (or refract) a ray of white light without separating the red from the violet—and thus we may obtain *refraction without color*.

This is not strictly the case, on account of what is called *irrationality of dispersion*, the existence of which is easily seen from the above table. Thus if we form two spectra, by means of properly constructed prisms, of different media, such that the lines B and H coincide, the lines D will not generally coincide. In other words, some substances draw out the red end of the spectrum more than the violet—and *vice versa*. Thus, from the above table:

	D—B.	H—D.
Flint Glass.....	0.0073	0.0360
Crown Glass.....	0.0088	0.0170

But 73:360::38:187; hence we see that the distance from B to D in flint bears a less proportion to that from D to H than it does in crown. Thus, if, by proper arrangements, as before mentioned, B and H be made to coincide, D will be nearer the middle of the crown spectrum than of the flint. Hence, a double achromatic lens, composed of flint and crown, may be made to refract equally any *two* colors of the spectrum; but

there will be a slight non-accordance of the remaining colors. Three colors may be made coincident by using a *triple* lens, but this is now rarely constructed.

REFRACTION, CONICAL. In certain cases, light, passing as a single ray through a plate of a crystallized body, emerges as a hollow *cone* of rays; and in others, a single ray, falling on the plate, becomes a cone inside the crystal, and emerges as a hollow cylinder. These extraordinary appearances were *predicted* from theory by sir W. R. Hamilton (q. v.), and experimentally realized by Lloyd. They form one of the strongest arguments in favor of the truth of the undulatory theory of light. In our article on that subject we shall briefly describe them in connection with the theory of double refraction in biaxial crystals.

REFRACTION, DOUBLE. The great majority of crystallized bodies—and in general, all transparent bodies (such as glass)—when unequally strained, as by pressure, heat, or rapid cooling, divide a single ray which falls on their surface into two. Through a plate of such a substance every object appears doubled. The cause of this singular phenomenon cannot be explained without reference to polarization (q. v.), and it is therefore deferred to the article on the **UNDULATORY THEORY OF LIGHT**, where the principal experimental facts will be given, along with their theoretical explanation.

REFRAIN (Fr.), otherwise called the *burden* of a song, a part of a song which is repeated at the close of every stanza.

REFRIGERANTS. This term is applied in medicine both to internal and external cooling remedies. The medicines of this class prescribed for internal use cause a refreshing feeling and a sensation of coolness throughout the system, although they do not in reality diminish the temperature of the body. Their principal use is in the treatment of febrile and inflammatory affections, in which the benefit they produce appears to depend on the fact, that their direct action on the coats of the stomach occasions, by nervous sympathy, a temporary reduction in the force of the circulation. They likewise have the power of allaying gastric irritability and the morbid sensations of heat and thirst. The following are the refrigerants in most common use for internal administration: citric and tartaric acids taken into combination with bicarbonate of potash as effervescing draughts, ripe oranges, lemons (in the form of lemonade q. v.), chlorate of potash (ten grains dissolved in water, and sweetened with syrup, to be taken every second hour), and nitrate of potash, which may be taken in the same manner as the chlorate, or as *niter-wohey*, which is prepared by boiling two drams of niter in a pint of new milk; the strained milk may be given in frequent doses of two or three ounces. Many continental physicians regard oxalic acid in the form of lemonade as the best of all the refrigerants. Its poisonous character must not be forgotten, but five grains dissolved in half a pint (or more) of water may be taken in divided doses in the twenty-four hours with perfect safety.

The following remarks on the external application of refrigerants are for the most part condensed from Mr. Simon's able article on "Inflammation" in Holmes's *System of Surgery*. Cold, continuously applied, is the sedative of every vital manifestation; and in theory, it may be regarded as being in direct and essential opposition to the causes of inflammation; and as it is thus an antidote to the causes of inflammation, rather than a remedy for the resulting changes, so, in order to get full advantage from its use, it should be employed from the moment when these causes begin to operate. Cold is of great value in the treatment of wounds, especially such as are made in surgical operations. The local temperature can be thus continuously moderated, care being taken that it is not too much reduced, so as to occasion gangrene. Under the effective use of cold (together, of course, with absolute rest of the parts), many a knee-joint, whether wounded accidentally or by a surgical operation, recovers without permanent injury. In most cases local cooling is best effected by water of the desired temperature. Cloths wetted with it are spread over the surface which is to be acted on, their original low temperature being retained either by their being continuously dripped upon by means of a bundle of threads inserted in a reservoir of cold water, and acting like a siphon, or by their being frequently re-wetted or changed. Their surface should be exposed as freely as possible to the air, so as to secure ample space for evaporation. In cases where great cold is required—as, for example, in cases of strangulated hernia, of inflammation of the brain and its membranes, or of fever with well-marked cerebral symptoms—bladders of pounded ice are preferable to wetted cloths. Both as regards the degree of cold and the period of its application, the surgeon should to a considerable degree be influenced by the sensations of his patient. When its application gives comfort, it is almost certain to be doing good; and in most cases where it gives discomfort, it is doing harm.

A notice of the external use of refrigerants would be imperfect without a reference to the memoir of Dr. Esmarch, professor of surgery in the university of Kiel, *On the Use of Cold in Surgery*, translated by Dr. Montgomery for "the new Sydenham society," in the year 1861. His mode of application is by means of India-rubber bags filled with ice, snow, or some freezing mixture; or of thin iron-plate reservoirs of cold water, made by means of a mold of gutta-percha to fit any inflamed part. In a case of "chronic purulent inflammation of the knee-joint," the ice-bags were continuously applied for 12

weeks. Dr. James Arnott's investigations on "Local Anæsthesia by Cold," in the *Medical Times* for the years 1854-5-7, and Dr. Chapman's method of treating nervous diseases by the application of cold to the spine, as recorded in his *Functional Diseases of Women* and elsewhere, require also a passing reference.

The application of cold, either through the medium of air or water, to the body generally is a subject of great importance. The use of cold air is especially seen in febrile cases, in which the physician directs the sick-room to be kept cool, and the patient (unless in exceptional cases) lightly clothed. Mr. Paget reports that the most successful cases of pyæmia that have fallen under his observation were those in which the patients were freely exposed to the air. The value of baths and cold effusions is noticed in the articles BATH and HYDROPATHY. In addition to what is there stated, it is important to know that prolonged immersion in water as warm as 95° Fahr. may be the means of reducing febrile temperature.

REFRIGERATING MACHINES. Under the head ICE, some notice is given of machines by which it can be prepared artificially; but as the practical importance of refrigerating apparatus is daily increasing, we propose to give here a fuller sketch of one or two kinds. The ice making machine of Carré & Co. of Paris being one of the simplest and best of those which produce cold by the evaporation of some volatile liquid, we shall describe it first. It is shown in figs. 1 and 2, and consists of two strong cast-

The cylinder A is charged with an aqueous solution of ammoniacal gas. Ammonia is a powerful absorber of heat, and is, moreover, so extremely soluble in water that the latter takes up nearly seven hundred times its volume of the gas. Air is completely expelled from the apparatus by opening a screw valve and heating the cylinder. It is then ready for use. On applying heat to the cylinder A, which fits into a small stove for the purpose, the solution of ammonia is volatilized, and carried over and condensed in the cylinder B, which is placed in a vessel containing cold water. The heat reaches to about 220° Fahr., and while it is being applied, the volatilized ammonia condenses into a liquid under very high pressure, produced by its own atmosphere, in the cold cylinder B. When the heating has gone on long enough—about half an hour for a small machine—the hot cylinder A is removed from the fire, and placed in a vessel of cold water, as shown in fig. 1. The cooling of this cylinder immediately

FIG. 1.

FIG. 2.

causes the reabsorption, by the removal of the pressure, of the condensed ammonia from the other cylinder B: and as it passes again from the liquid to the gaseous state, intense cold is produced (see HEAT), and, in consequence, heat abstracted from everything in contact with this portion of the apparatus.

The cold cylinder B is shown in section in fig. 1. It is so constructed that the ammonia is contained in an outer jacket, leaving a hollow space in the center. When ice is to be made the latter is filled with salt water or other liquid which does not freeze at 32° Fahr., and into this is placed a loosely fitting metal cylinder D, containing the water to be frozen. In this way, with a small machine for domestic purposes, a few

pounds of ice can be made in an hour or two; but large machines, on the same principle, are made which produce 440 lbs. of ice per hour.

There is a well-known refrigerating machine by Mr. D. Siebe of London, in which ether is used as the volatile fluid, its evaporation being produced not by heat, but by the action of an air-pump; the necessary cold is produced in the surrounding brine as the ether passes into vapor.

M. Pictet of Geneva has invented an ice-machine which works with anhydrous sulphurous acid instead of ether; but otherwise his process somewhat resembles Siebe's. It is now at work at an ice-making company's works in King's road, Chelsea. Some machines are also in use which produce ice by means of freezing mixtures; but they are of minor importance.

Mr. A. C. Kirk, late of the Bathgate chemical works, undertook, a few years ago, a series of experiments with a view to the construction of such an apparatus which would produce cold by the simple expansion and compression of air. He ultimately succeeded in producing an ingenious machine, which he patented April 25, 1862, the number of the specification being 1218.

Although it is not strictly true that the mere rarefaction of air produces cold, yet it will simplify the explanation of this machine to assume in the mean time that it does so. Its simplest form is shown in fig. 2, and consists of a cylinder with a piston to compress air, communicating with another cylinder containing a kind of piston or plunger where the compressed air is cooled and expanded. The machine is driven by a steam-engine, and it may be as well to remark, that the actual relative position of the cylinders is different from that shown in the diagram, which is given rather to show the principle of the apparatus than as an accurate representation of it.

The compressed air is forced by the compressing cylinder A into the refrigerating cylinder BB, just at the moment when the position of the plunger, PP, is close upon the upper cone D. This air, which fills the space *ac* between the plunger, PP, and the lower cone E, is of course heated by the compression; and in order to cool it again, cold water is made to circulate in the cone E, by an entrance-pipe F, and an exit-pipe at G. The next movement of the machine draws the piston in the cylinder A to the opposite end, and consequently allows the compressed air to expand again; but at the same moment the plunger, PP, descends close upon the cone E, thus allowing the space between the plunger and the upper cone D to be at its fullest when the expansion of the inclosed air is at its greatest.

By this arrangement, the patentee secures that the air while being compressed will always be at the lower, or what he calls the hot end, of the refrigerating cylinder B; and while being expanded, it will always be at the upper or cold end. There is a regenerator constructed as in the calorific engine (q. v.) of wire-gauze, placed in the middle of the plunger at C. This, while it allows the air to move freely through it, prevents the conveyance of heat or cold from one end of the cylinder to the other. The plunger, PP, is filled internally with sawdust or some non-conducting material.

We may now explain that the low temperature of the air which surrounds the cone D during expansion is not produced by simple rarefaction. That alone would not produce cold. It is necessary as well to abstract heat from the air by giving it some work to do, and here it unavoidably does work, in assisting to force back the piston of the compressing cylinder, while in the act of expanding. The air loses an equivalent of heat exactly in proportion to the amount of force which it expends in moving, or in assisting to move, the piston. See FORCE.

Before air is admitted into the cylinders, it is necessary to dry it thoroughly, by first passing it through a box containing chloride of calcium, because, if any moisture were present, it would freeze in the regenerator, and stop the action of the machine. In the particular form of the apparatus shown in the figure, the substance to be cooled is placed inside the cone D, which is furnished with a lid L. Here not only water, but even mercury, can be frozen with facility.

Most of the machines of this kind which have as yet been made were required for working on a more extensive scale than the one shown in fig. 2 could easily do. In the larger-sized machines, accordingly, instead of one hollow cone like D (fig. 2), a series of circular V-shaped corrugations are fixed to the top cover of the refrigerating cylinder. These form annular passages through which a continuous current of some fluid not easily frozen, such as brine, flows. This is of course cooled by the expanded air (in the manner already explained) at the cold end of the cylinder, and can be conveyed away in pipes to cool any substance at a greater or less distance from the machine.

After a trial of more than 10 years, the use of Mr. Kirk's machine has, in several large chemical works at least, been given up in favor of those machines which, like Siebe's, evaporate ether or some other very volatile liquid by mechanical power. Here, as in most other applications of it, the use of compressed air has as yet proved too costly. In some recent trials, an ether-machine required only 5 cwt., while Kirk's consumed 20 cwt. of coal to make a ton of ice. However, notwithstanding the difficulties attending the economical employment of compressed air for this purpose, as shown by the imperfect success of both Kirk's and Windhausen's refrigerators, Messrs. Bell & Coleman of Glasgow have quite recently introduced another compressed-air machine, which in 1879 was on its trial on board one or two large steamers engaged in bringing fresh meat from America to England.

The ether-machine of Siddeley & Mackay of Liverpool, which is an improvement on Siebe's, is now a good deal used for making ice, and for other purposes. In it a steam-engine is employed to work two vacuum-pumps, and to supply motive-power to other parts of the apparatus. The refrigerating vessels contain thin pipes, through which brine or chloride of calcium flows. Ether surrounds these pipes; and under the reduced pressure produced by the vacuum-pumps, with which the refrigerators communicate, a portion of the ether evaporates, producing cold in the act of doing so, as already explained. The ether vapor is then condensed at a slight pressure, cooled by a stream of cold water, and returned to the refrigerator. Some paraffine oil makers who use this machine have found that a very light shale naphtha answers as well as ether for their purpose.

Having already described Carré's small portable ammonia-machine, we may add here that this kind of ice-machine, even in its larger and more complicated continuous form, since it works by heat and has few moving parts, is really the simplest of all. Reece's ammonia-machine is more recent than Carré's, and is worked with anhydrous ammonia, instead of an aqueous solution of it. In Reece's process less fuel is required to distill the ammonia, less water to condense it, and less power to work the moving parts of the machine. Some imperfections which it nevertheless had appear to have been overcome, as it is now introduced into several of the London breweries.

It is only within the last twenty years that much attention has been given to the construction of machines for the production of artificial cold on the large scale; but they have already received several important applications. In this country, besides being available for the production of ice; the extraction of certain salts from mixed solutions, such as sulphate of soda from common salt—the former separating at a temperature above that which keeps the latter in solution; the separation of paraffine from mineral oils; and in other chemical operations, as well as for cooling worts in breweries and distilleries, they are now turned to good account in bringing fresh meat from distant countries to our shores. In warm countries, besides other uses, they could be applied to cool large hospitals and public buildings, by sending a current of some cold liquid through pipes, just as we in Great Britain heat buildings with pipes through which hot water flows.

REFRIGERATION OF THE EARTH. That the earth is at present losing heat, is an immediate consequence of the observed fact, that the temperature of its crust *increases* as we descend; for, in any conducting body, the flux of heat is always from warmer to colder parts; and the rate at which heat is thus lost can be easily calculated if we know the conducting power (for heat) of the rocks forming the crust, and the rate at which the temperature increases with the depth under the surface; for the conductivity may be measured by the quantity of heat which, in unity of time, passes (per square foot of surface) through a layer of rock of 1 foot thickness, whose upper and lower surfaces are maintained at temperatures differing by 1° Fahr. Hence, if k be the conductivity of the crust, and if the temperature increases by 1° Fahr. every x feet of descent, the quantity of heat lost in unit of time from each square foot of surface, is measured by $\frac{k}{x}$. k and x can

be determined by experiment for any particular locality, and thus the loss may be determined. These quantities vary very much in value in different localities, thus x is sometimes as great as 110, sometimes as small as 15. The value 50 is generally supposed to give a fair average—that is, for every 50 ft. of descent the temperature increases by 1° Fahr. Hence the stifling heat experienced in deep mines. At the depth of a mile the temperature would on this estimate exceed that of the surface by more than 160° Fahr. Beds of coal at such a depth could not be wrought, as the temperature would far exceed that of tropical climates.

Three methods of accounting for this increase of temperature toward the interior of the earth have been proposed: 1. That the earth was originally molten, either throughout or for a considerable depth over the whole surface; 2. That the internal heat is due to chemical combination; 3. That the earth, ages ago, passed through a region of space where the temperature was far above that of its present envelope.

Of (1) it is sufficient to say that such a state is the necessary consequence of impact, if the earth was formed by the aggregation of cosmical masses due to their mutual gravitation. It is scarcely doubted now that this is the origin of solar and stellar heat; and the fact of the moon's turning always the same face to the earth (see ROTATION), is most easily explained on the hypothesis of her original fluidity. The figure of the earth (see EARTH) is also a strong argument in favor of this hypothesis. This explanation of the origin of the earth's internal heat is obviously consistent with the increase of temperature as we descend below the surface—for a spherical mass of molten rock will evidently soon cool externally, while its low conductivity (rendered still lower by the high temperature) will prevent the interior from supplying anything at all equivalent to the loss at the surface. On this hypothesis the rate of loss of heat must constantly become smaller and smaller, but very slowly; and it is possible that a considerable portion of the earth's mass may still be in a melted state.

The second hypothesis is perfectly sufficient to account for observed facts, but is apparently unnecessary, since (1) has been shown to be, in the universe, a *vera causa*. It is only alluded to here because Lyell and other distinguished geologists have endeav-

ored to show from it that the earth need not be losing heat on the whole, a result perfectly untenable. They suppose the internal heat to be generated by chemical combination, and then that the compounds so formed are again decomposed by electric currents produced by the heat (see THERMO-ELECTRICITY), and are thus prepared to combine again and reproduce the heat. Were this the case we should have a perpetual motion (q.v.), and, in the present state of science, this is known to be impossible.

The third hypothesis, proposed by Poisson, is easily shown to be inconsistent with known facts; for, if the passage through the warm region be supposed to have taken place from 1250 to 5,000 years ago, the temperature at the earth's surface must have been from 25° to 50° Fahr. above the present mean temperature, which is inconsistent with history. If it took place 20,000 years ago, the mean temperature must have been 100° Fahr. above its present value. Geology shows that this cannot be accepted. And, if it be supposed to have taken place more than 20,000 years ago, the requisite temperature must have been incompatible with the existence of animal or vegetable life.

From the above argument, which is taken from a paper by sir William Thomson in the *Transactions of the Royal Society of Edinburgh* (1862), it is obvious that the first hypothesis is that which we must, in the present state of our knowledge, adopt.

Supposing the temperature of melting rock to be from 7,000° to 10,000° Fahr. (and experiments seem to show that it lies somewhere between these limits), the present state of temperature of the crust indicates that the earth became solid somewhere between 100,000,000 and 200,000,000 years ago. These estimates are based on the known laws of conduction of heat discovered by Fourier, and the conductivity of rocks and soils, deduced by principal Forbes (q.v.) from observations made in the neighborhood of Edinburgh. But as these observations refer to conductivity at very moderate temperatures only, and as Forbes has shown that conductivity is in general lowered by heating, the lower limit above may possibly be reduced to *twenty million years*.

In conclusion, we may mention, to show how little the internal heat of the earth has to do with surface temperature, that Thomson has shown (*Proc. R. S. E.*, 1863-64) that if we accept the estimate of 1° Fahr. of increase of temperature for 50 ft. of descent, the earth's surface is heated (by conduction of heat from within) only $\frac{1}{25}$ of a degree Fahrenheit.

REFRIGERATOR. See FREEZING MIXTURES; and REFRIGERATING MACHINES.

REFUGEE' (Fr. *refugié*), a name given to persons who have fled from religious or political persecution in their own country, and taken refuge in another. The term was first applied to those Protestants who found an asylum in Britain and elsewhere at two different periods, first during the Flemish persecutions under the duke of Alva in 1567, and afterward in 1685, when Louis XIV. of France revoked the edict of Nantes. Of the numerous French artisans who settled in England on this last occasion, the most part Anglicized their names, as by substituting Young for "Le Jeune," Taylor for "Tellier," etc., so that their posterity can now hardly be recognized as of foreign origin. According to Lower (*Patronymica Britannica*) De Preux became Deprose, and "Richard Despair, a poor man," buried at East Grimstead, was, in the orthography of his forefathers, Despard. There were also refugee families of a higher class, some of whose descendants and representatives came to occupy a place in the peerage. The Bouveries, earls of Radnor, are descended from a French refugee family. The refugee family of Blaquière was raised to the Irish peerage; and Charles Shaw Lefevre, lord Eversley, is the representative of a family of Irish refugees. The military employment offered in Ireland after 1688 maintained a considerable number of foreign Protestants. Gen. Frederic Armand de Schomberg was raised by William III. to the peerage, becoming eventually duke of Schomberg. A Huguenot officer of hardly less celebrity was Henry Massue marquis de Ruvigny, created by William III. earl of Galway. Lord Ligonier was also of a noble Huguenot family, and England has had at least one refugee bishop in Dr. Majendie, bishop of Chester, and afterward of Bangor. Among other refugees of note may be enumerated sir John Houblon, lord mayor of London in 1689, one branch of whose family is now represented by lord Palmerston; Elias Bouherau or Boireau, D.D., whose descendant was created a baronet as sir Richard Borough of Baselden Park, Berkshire; as well as Martineaus, Bosanquets, and Papillons, whose descendants have attained more or less eminence in the country of their adoption. The first French revolution brought numerous political refugees to England, and Great Britain is noted throughout Europe for affording a ready asylum to refugees of all classes, both political and religious. Weiss's *History of the French Protestant Refugees, from the Revocation of the Edict of Nantes to the Present Time*, translated by Hardman (London, 1854); J. S. Buru's *History of the French, Walloon, Dutch, and other Foreign Protestant Refugees settled in England from the Reign of Henry VIII. to the Revocation of the Edict of Nantes*.

REFUGIO, a co. in s. Texas, bordering on the gulf of Mexico; drained by the San Antonio and the Arkansas rivers, its n. and s. boundaries; 900 sq.m.; pop. '80, 1585—1412 of American birth, 336 colored. The county is almost entirely occupied as pasture land, and the number of cattle exported is very large. Co. seat, Refugio.

REGALBUTO, or **RAGALBUTO**, a city in the island of Sicily, in the province of Catania, and 30 m. w.n.w. of the city of that name. It is beautifully situated on a hill near the right bank of the river Salso, and with Mt. Etna bounding the prospect on the n.e. Its only object of interest is the cathedral. Pop. 9,000.

REGALIA, the ensigns of royalty, including more particularly the apparatus of a coronation. The regalia of England were, prior to the reformation, in the keeping of the monks of Westminster abbey, and they are still presented to the sovereign at the coronation by the dean and prebendaries of that church. During the civil war the crown and most of the regalia fell victims to Puritan zeal; and on the restoration of the royal family, new ensigns had to be made for the coronation of Charles II., which, with occasional alterations and repairs, have continued in use down to the present day. The regalia, strictly so called, consist of the crown, the scepter with the cross, the verge or rod with the dove, the so-called staff of Edward the confessor (made in reality for Charles II.), the blunt sword of mercy called Curtana, the two sharp swords of justice, spiritual and temporal, the ampulla or receptacle for the coronation oil, the anointing spoon (probably the only existing relic of the old regalia), the armillæ or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the jewel-room in the tower of London, in which are also a smaller crown, scepter, and orb for the coronation of a queen-consort, two other queen-consorts' scepters—one of ivory, made for Marie d'Este; and the state-crown of silver and diamonds, which was used at the coronation of queen Victoria, containing a large ruby and sapphire, the former said to have been worn by Edward the Black Prince. The prince of Wales's crown of gold, without stones, is modern.

The proper regalia of Scotland consist of the crown, the scepter, and the sword of state. The crown probably belongs to the time of Robert Bruce, and is adorned with crosses and fleurs de lis alternately. It was originally an open crown, but two concentric arches were added in the reign of James V., surmounted at the point of intersection by a mound of gold and a large cross patée. The scepter is of the time of James V.; the sword was a present from pope Julius II. to James IV. in 1507. During the civil war the regalia were removed by the earl marischal for safe custody from the crown-room of Edinburgh castle, their usual place of deposit, to his castle of Dunnottar; and while Dunnottar was besieged by the parliamentary army, the regalia were preserved by being conveyed by stratagem to the manse of Kinneff, by the wife of Ogilvy of Barras, the lieutenant-governor, and the wife of the minister of Kinneff. From the restoration to the union the regalia continued to be kept in the crown-room as formerly; at the beginning of each session they were delivered to the earl marischal or his deputy, in whose custody they remained while parliament was sitting, and were afterward restored to the charge of the treasurer. William, ninth earl marischal, who opposed the treaty of union in all its stages, declined to witness its consummation, but appeared by his deputy, who took a written protest that the regalia should not be removed from the castle of Edinburgh without warning given to him or his successor in office. From that time till 1818, the regalia remained locked in a chest in the crown-room, away from public gaze, and it came to be the general belief that they had been secretly conveyed away to London, an idea confirmed by the keeper of the jewel-office in the tower showing a crown which was alleged to be that of Scotland. On Feb. 4, 1818, an order being obtained by warrant under the sign-manual of George IV., then prince-regent, the chest in the crown-room was broken open, and the crown, sword, and scepter were found as they had been deposited at the union, along with a silver rod of office, supposed to be that of the lord high treasurer. They are now in the charge of the officers of state for Scotland, as commissioners for the custody of the regalia, and are exhibited in the crown-room, along with a ruby ring set with diamonds, worn by Charles I. at his coronation at Holyrood in 1633; the golden collar of the garter, sent by Elizabeth to James VI.; the St. George and dragon, or badge of the order of the garter; and the badge of the order of the thistle, with figures of St. Andrew and Anne of Denmark, set in diamonds. These latter insignia were bequeathed by cardinal York, the last of the Stuarts, to George IV., and sent to Edinburgh castle in 1830 by order of William IV.

REGALIA, or **REGALE**, **RIGHT OF**, a right in ecclesiastical things, claimed by sovereigns in virtue of the royal prerogative, which has frequently been the subject of controversy between kings and popes. It involved several points as to presentation to benefices, most of which formed the object from time to time of negotiation by concordat; but the most serious conflict arose out of the claim made by the crown to the revenues of vacant benefices, especially bishoprics, and the co-ordinate claim to keep the benefice or the see vacant for an indefinite period, in order to appropriate its revenue. This plainly abusive claim was one of the main grounds of complaint on the part of the popes as to the practice of lay investitures (q. v.), and it reached its height in England under the first Norman kings, especially William Rufus. The most memorable conflict, however, on the subject of the regalia, was that of Innocent XI. (q. v.) with Louis XIV., which was maintained with great pertinacity on both sides for several years, the king extending the claim to some of the French provinces, which had until then been exempt from it, and the pope refusing to confirm any of the appointments of Louis to the sees which became vacant, as long as the obnoxious claim should be persisted in. The dispute continued till after the death of Innocent, Louis XIV. having gone so far as to seize upon the papal territory of Avignon in reprisal; but it was adjusted in the following pontificate, the most obnoxious part of the claim being practically abandoned, although not formally withdrawn.

REGALITY, a species of territorial jurisdiction formerly existing in Scotland, nearly akin to a palatinate (q. v.) in England. The lands were given over by the sovereign *in*

liberam regalitatem to some powerful noble, called a *lord of regality*, to control as he best might with the strong hand. The lord of regality exercised the highest prerogatives of the crown, including originally the four pleas, often having a complete court of his own, with seneschal, chancellor, chamberlain, and other officials, in imitation of royalty. An offender amenable to a court of regality might have been repledged from the sheriff, or even from the court of justiciary. Jurisdictions of regality were abolished by act 20 Geo. II. c. 50.

REGALS (perhaps from *rigabello*, an instrument used prior to the organ in the churches of Italy), a small portable finger-organ in use in the 16th and 17th centuries, and perhaps earlier. Many representations exist of this instrument, including one sculptured on Melrose abbey. The tubes rested on the air-chest, which was filled by the bellows; and the bellows were managed with one hand, and the keys with the other. Until 80 years ago there existed in the royal household an officer called the *tuner of regals*.

REGARDANT, a term used in heraldry with reference to an animal whose head is turned backward. See **PASSANT** and **RAMPANT**.

REGAT TA. This word originated in the Venetian dialect, and signified a boat-race, held annually with great solemnity among the gondoliers. Thence the expression has extended its meaning, and is now applied to all rowing or sailing matches indiscriminately, and especially to the contests between yachts.

REGELATION. This is an exceedingly ill-chosen term for a somewhat obscure phenomenon, inasmuch as it implies a previous state which may not have existed. Unfortunately, the term has come into general use, and we must make the best of it. The principal fact to be explained is the adhesion of two pieces of ice brought into contact, not merely in air, but even when both are immersed in water at such temperatures as 100° Fahr. Several explanations have been proposed, of which we may specially mention those of Faraday, Forbes, and J. Thomson.

Faraday's idea seemed to be, that in liquid and solid bodies the proximity of particles in a particular state tends to produce the same state in other particles; and thus, that a film of water between two plates of ice tends to assume the solid state. There are many singular phenomena in physical science which are apparently explicable by this suggestion; but with all due deference to so great an authority, the so-called explanation seems merely to *shift* the difficulty, without in any way overcoming it.

Forbes starts with the assumption, that ice is essentially colder than water, and therefore that there is constantly a transfer of heat from water to ice which is in contact with it; the effect being to cover the surface of the ice with a film of half-melted ice or half-frozen water. Such a film, existing between two slabs of ice, would part with heat to both, and would freeze without melting the adjacent ice. This explanation would be satisfactory if the postulate could be granted, but it seems very improbable that there is any such essential difference of temperature between solid and liquid water.

The explanation proposed by prof. J. Thomson is undoubtedly founded on a *vera causa*, but there may be some hesitation in allowing that the cause is adequate to the production of the observed effect in every case. It is certain, however, that it accounts for at least part of the phenomenon. It is founded on his very beautiful theoretical discovery that the *freezing-point of water is lowered by pressure*, which was experimentally verified by W. Thomson. Hence, if two slabs of ice be pressed together, at the points of greatest pressure the ice will be melted; its latent heat of fusion must be drawn from surrounding bodies, and thus cold is produced which will freeze part of the film of water between the two slabs. The points of greatest pressure will thus be shifted, and the process of melting and regelation may go on indefinitely. Objections to this explanation were advanced by Faraday and Forbes, who showed that slabs of ice freeze together when suspended vertically with the view of avoiding pressure between them. But J. Thomson shows that the capillary forces of the film of water which must (in these cases) be between the slabs (for without directly applied pressure the effect cannot be obtained with slabs of *dry* ice), are sufficient to produce the pressure requisite for the application of his mode of explanation.

This part of the subject cannot be said to be completely cleared up; but the theory of J. Thomson has been applied with perfect success to the explanation of the very extraordinary phenomena observed in *glaciers* (q.v.), where enormous forces are constantly at work. It evidently at once accounts for the result of observation, due to Rendu and Forbes, that a glacier moves like a viscous fluid: in fact, it shows why and how the mass gives way to pressure, and how it is refrozen in a new form, which in turn gives way to the new distribution of pressure. The explanation of the veined structure, the formation of clear ice from snow, etc., are all easily deduced from it.

The phenomena of regelation are easily seen in the making of snow-balls, which is well known to be impossible, by the hands at least, when the snow has been exposed to great cold, and is therefore dry. But, even in this case, the effect is easily obtained by the application of pressure sufficient to melt the ice, as is well seen in wheel-tracks, etc. By means of a Bramah's press, it is easy to convert a snow-ball into a sphere of perfectly clear ice.

REGENERATION is a theological expression denoting the spiritual change which passes on all men in becoming Christians. There are various interpretations of the mode and meaning of this change, but its necessity in some shape or another may be said to be admitted by all branches of the Christian church. By all, man is supposed, as the condition of his becoming truly Christian, to pass from a state of nature to a state of regeneration, from a state in which he obeys the mere impulses of the natural life to a state in which a new and higher—a divine—life has been awakened in him. The words of our Lord to Nicodemus: "Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God," are accepted as the expression of this universal necessity by the Christian church. It may be further stated that every branch of the Catholic church recognizes, although under very different conditions, the Holy Spirit as the author of this change. The change, in its real character, is spiritual, and spiritually induced. According to certain sections of the Christian church, however, the change is inseparably involved with Christian baptism, in all cases; while other sections do not acknowledge any essential connection between baptism and regeneration. In the view of the former, baptism constitutes always a real point of transition from the natural to the spiritual life. The grace of baptism is the grace of regeneration; the laver of baptism is the laver of regeneration, not merely in any formal sense, but in a real and living sense, so that every baptized person—or at least every rightly baptized person—has already become a Christian truly, although he may fall away from the grace that he has received. This is what is commonly called the high church doctrine of regeneration. In the view of others, regeneration is a special, conscious process, which takes place independently of baptism, or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life; and many Christians have spoken with rapture of this *experience*, of its thoroughness, its suddenness, its immediateness. There are different shades of opinion on the subject, some holding it as a condition of regeneration, that the regenerate should be able to recount, or at least give some precise idea of the time and manner of the change through which they have passed; others repudiating such views as savoring of fanaticism, yet holding no less to the spiritual definiteness of the change, independently of church forms of any kind; and such views, in contradistinction to the high church doctrine, have received the name of evangelical. The idea that regeneration is essentially involved in baptism, or identical with baptism, is supposed by many Christians to be a peculiarly unevangelical idea, opposed to the spirituality and freedom of divine grace.

REGENSBURG, or **RATISBON** (Lat. *Reginum, Radespona*), the capital of the Bavarian province of Oberpfalz and Regensburg, is situated on the right bank of the Danube, at the mouth of the Regen, 65 m. n.e. of Munich. Pop. '75, 31,487. Regensburg, which was formerly a free city of the empire and the seat of the German diet, is pleasantly situated in the midst of a broad and fruitful valley, lying 1000 ft. above the level of the sea. It presents a strongly marked mediæval character, with its ancient ramparts, fosses, and gates, and its narrow crooked streets, with their high, many-cornered, gabled houses, while it retains many interesting monuments of its importance and wealth during the middle ages. Among its 13 Roman Catholic churches, the most remarkable is the cathedral, begun in 1275, and not completed till the middle of the 17th c., which ranks, since its restoration in 1830-38, as one of the noblest specimens of German architecture, and is especially noteworthy for the fine monuments of its former bishops, and for its silver altar and numerous painted-glass windows, restored in 1830. The Scottish church of St. James (secularized in 1862) dates from the 12th c., and is built in the pure Byzantine style. There are several monasteries in Regensburg, and three Protestant churches. The old town-hall was used for a century and a half as the place of meeting for the imperial diet. The royal library contains 60,000 volumes. The city has several highly ornamental fountains, and contains a monument to Kepler, the astronomer, who died in Regensburg. A stone bridge connects Regensburg with the busy trading suburb of Stadt am Hof. The manufactures of Regensburg include gold, silver, brass, and steel wares, paper, earthenware, beet-root sugar, brandy, and candles and soap of superior quality. Since 1853 it has been a free port; and in addition to ship-building, which is carried on with much activity, the trading community is extensively engaged in the transport of corn, wood, and salt. Regensburg, as the principal seat of the Danube steam-navigation company, is an especially busy trading port.

Regensburg, which ranks as one of the most ancient cities of Germany, and was built by the Romans, by whom it was named *Reginum*, was a place of considerable commercial importance in the early ages of Christianity. In the year 750 a bishopric was founded here, which embraced a large portion of Bavaria and the Upper Palatinate. Under the emperor Frederick I., it was relieved from the subjection under which it had previously stood to the dukes of Bavaria, and declared a free city. During the middle ages it was the chief seat of the Indo-Levantian trade, and was one of the wealthiest and most populous cities of southern Germany. From 1663 to the dissolution of the German empire in 1806, Regensburg was, with a very short interregnum, the seat of the German diet; and after undergoing various changes of fortune during the period of Napoleon's power, was finally ceded to Bavaria, of which it has since formed an integral part.

RE'GENT (Lat. *rego*, I govern), one who exercises the power without having the name of a king. In a hereditary monarchy there are various circumstances which may necessitate the delegation of the sovereign power—as the devolution of the crown on a minor too young to be intrusted with the kingly office; the incapacity of the sovereign by illness, mental or bodily; and the case of absence from the realm. A regent under the title of protector (q.v.) has often been appointed to exercise royal authority in the sovereign's minority, the latest instance in England being during the minority of Edward VI.; and regents and councils of regency have been sometimes named by the sovereign to provide for the probable nonage of his heir. According to Coke, the surest way of making such an appointment is by authority of the great council in parliament; and in recent times the appointment has generally been made by statute. During the frequent absences of the first two kings of the house of Hanover in their continental dominions, it was the practice to appoint regents or *lords justices* (q.v.) to exercise the powers of sovereign. In 1788, when George III. became incapacitated from exercising the kingly office by insanity, it became a question whether his eldest son, then of full age, had a right to be regent, or whether the nomination rested with parliament. The chief political authorities of the time were divided in their judgment, but the king's recovery ended the discussion. On the return of the malady, all parties were unanimous that the regency should be conferred on the prince of Wales; this was done, however, by parliament, and for the first year of his regency, certain restrictions were imposed, which were to be removed in the case—which eventually occurred—of the king's continued illness.

In 1830 a regency bill was passed, providing for the administration of the government, should the crown descend to the princess Victoria before she attained eighteen years of age; and in 1840 a regency bill (3 and 4 Vict. c. 52) was passed, providing that the late prince consort should be regent, in the event of the demise of the queen, her next lineal successor being under age. During her present majesty's various short absences from the country there has been no delegation of the royal power.

REGENT OF A UNIVERSITY. In the university of Paris, where this as well as other learned distinctions originated, every master of arts possessed the privilege, which he was bound to exercise, of delivering public lectures. The same was the case at first in the universities of Oxford and Cambridge. In process of time, however—about the middle of the 13th c.—the title of master became a degree attainable by any one after a certain amount of residence, and a certain proficiency, and the duty of lecturing was confined to a limited number of graduates, called *regents*. The regents were eventually succeeded in the office of lecturing by the established professors. In the English universities a master of arts becomes a regent after a short period, and is supposed to read lectures during the year of his regency. The regents still form the governing body in the convocation and congregation at Oxford, and in the senate of Cambridge. In the Scottish universities, according to their early constitution, the regents were the lecturers; and celibacy was enforced on them down to about the middle of the 17th century.

REGGEL'LO, a small t. of Italy, in the province of Florence, and 16 m. e.s.e. of the city of that name. It is surrounded by beautiful hills, which produce wines, fruits, and grain in abundance. Pop. 10,200.

REGGIO (**REGGIO NELL' EMILIA**), a province of n. Italy, having the river Po for its n.w. boundary; 884 sq.m.; pop. '72, 240,635. It borders on Cremona, Mantua, Modena, Massa e Carrara, and Parma, and is drained by the Enza, an affluent of the Po, and the Crostolo, rising in the Apennines and emptying into the Po. A road crossing the central Apennines leads from Tirizzano to Reggio, its capital. It is divided into the districts of Reggio d' Emilia and Guastalla. Its agricultural products are wheat, maize, rice, pulse, hemp, etc., and these, with dried fruits and marble, are largely exported. The peasants in the mountains subsist principally on corn meal mush, flour, beans, and chestnuts. The most important manufactures are linen, silk, canvas, leather, carriages, and articles made of horn, wood, and ivory. It has an active trade in country produce and cattle. Capital, Reggio.

REGGIO (anciently, *Rhegium Julii*), a seaport in the south of Italy, the chief city of the province of Reggio (formerly Calabria Ultra I.), stands on the shore of the strait of Messina, 10 m. s.e. of the city of Messina in Sicily. Pop. (1871) of town and suburbs, 29,854; of commune, 35,295. It is well built; its streets are wide and regular, and it is surrounded by a wall flanked by towers. A fine cathedral, a hospital, and several educational institutions are the principal buildings. Manufactures of linens, stockings, silks, and odoriferous waters, are carried on. The fisheries of the vicinity are profitable, and abound in the pinna (q.v.), a mollusk, the very delicate skin of which is made into gloves, stockings, and caps of great value. The climate of Reggio is salubrious, and the scenery of the vicinity exceedingly beautiful; the soil is rich, and produces fruit-bearing plants, both of the temperate and tropical zones, in great variety. Behind the city rises Aspromonte, a mountain of the Apennines, where Garibaldi was wounded and taken prisoner in 1862.

The ancient *Rhegium* was founded by the Greeks, was governed wisely and justly by Anaxilas, and afterward by his sons, 494-61 B.C. It was besieged and destroyed by Dionysius the elder, rebuilt by Dionysius the younger, and afterward united to Rome.

REGGIO, a city of central Italy, formerly belonging to the duchy of Modena, and now included in the province of that name, stands on the ancient *Via Emilia*, 16 m. w.n.w. of the city of Modena. Reggio is situated on a fertile plain on the right bank of the *Crostolo*; is surrounded by a wall; contains beautiful palaces, and a fine cathedral of the 15th c. and other churches, which possess famous paintings; the *Teatro Nuovo*, one of the finest theaters in Italy; the lunatic asylum; a museum, an academy, and many other institutions. It is a rich city, and has manufactures of cotton, of cloth, and of other stuffs. Population of the town proper about 20,000.

REGIAM MAJESTA TEM is the title given to an ancient collection of laws bearing to have been compiled by order of David I., king of Scotland. The authenticity of the work has been controverted, the prevalent opinion being that it is a compilation from the English work of Glanville, called the *Regiam Potestatem*, and that the publication of the book was an artifice of Edward I. to further his design of assimilating the Scotch law to that of England.

REGIL LUS, LAKE, anciently a small lake of Latium, to the s.e. of Rome, somewhere about the foot of the Tusculan hills. If Gell's conjecture as to its situation be correct, it must have occupied an extinct volcanic crater at a place called Cornufelle, near the modern Frascati. Lake Regillus is celebrated in the semi-legendary history of Rome as the scene (496 B.C.) of a great battle between the Romans under Aulus Postumius, and the Latins, on behalf of the banished Tarquin, under O. Mamilius. The latter were entirely defeated, and an end, it is said, was put to the efforts of Tarquin to force his return to the city.

REGIMENT, in all modern armies, is a colonel's command, and the largest permanent association of soldiers. Regiments may be combined into brigades, brigades into divisions, and divisions into armies; but these combinations are but temporary, while in the regiment the same officers serve continually, and in command of the same body of men. The strength of a regiment may vary greatly even in the same army, as each may comprise any number of battalions. French and Austrian regiments have ordinarily 4 to 6 battalions. Among British infantry, the smallest regiments are those numbered from the 26th upward (except the 60th), which have 600 men each, composing one battalion. The 60th and rifle brigade comprise each 4 battalions. The whole artillery force is comprised in one regiment. The strength of a regiment is changed from time to time; usually by the addition or withdrawal of private soldiers. The present plan would be, in case of war, to raise the skeleton regiment to war strength by calling in men from the army reserve.

The regimental system could only exist where standing armies are maintained. Accordingly, the Macedonian syntagma and the Roman cohorts were evidently regiments in a strict sense. During the middle ages, feudal organization precluded the system, and its first reappearance was in France. Francis I. formed divisions of 6,000 men each, which were divided into independent companies, the latter being, in fact, battalions, and each legion a regiment. The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland, 1598. From that time forward, the army and militia of Britain have been organized into regiments. Charles I. and the parliament each raised regiments, all of which were disbanded at the restoration, with the exception of the lord-general's regiment of foot, and his life-guard of horse. These two were re-engaged (1661), and form the present Coldstream guards and royal horse-guards. In the same year, a Scotch corps of 1700 men, which had taken service in France in the time of James I., returned to England, and was included in the British army as the 1st foot. Other regiments of infantry were gradually raised as required. In 1693 was raised the 1st troop of horse grenadier guards, and the 2d troop in 1702. These were disbanded in 1782, and reformed as the 1st and 2d life-guards, which still exist. Besides cavalry and infantry, the British army comprises the regiment of artillery, and the corps of royal engineers, and military train.

The total regiments of the British army for the year 1876-77 were:

	Regiments.	Officers and Men.
Life-Guards.....	2	868
Horse-Guards (Blues).....	1	434
Cavalry of the Line—		
Dragoon Guards.....	7	15,973
Dragoons.....	3	
Hussars.....	13	
Lancers.....	5	
Horse Artillery.....	1	{ 5,633 in 6 brigades.
Foot Artillery.....		
Royal Engineers.....	1	5,710
Foot Guards.....	3	5,950 in 7 battalions.
Infantry of the Line.....	110	119,483 in 141 battalions.
Army Hospital Corps.....	1	1,574
Army Service Corps.....	1	8,014
West India Regiments } (black troops)	2	1,832 in 2 battalions.
Colonial Corps.....	1	649 in 1 battalion.
Total.....	151	190,411

Each regiment is nominally commanded by a col., who is an old general officer, and whose office is merely a sinecure. The real command rests with the lieutenant-col. in each battalion, who is assisted by a major, and has for a staff an adjutant, a quartermaster, a paymaster, and a surgeon. The regiment or battalion is divided into companies in infantry, engineers, and army service corps; into troops in the cavalry. The artillery is divided into 30 brigades, each of which is as large as an ordinary regiment. The brigade is subdivided into batteries, which are the working units. The working officers are captain and two lieutenants to each infantry company or cavalry troop; major, captain, three lieutenants per battery of artillery.

The following table shows the allotment of the several ranks in each arm at home:

	Infantry Battalion of 8 Companies.	Cavalry Regiment of 8 Troops.	Field-artillery Brigade of 7 Batteries.
Officers—			
Staff.....	5	7	11
Companies, troops, or batteries.....	21	21	35
Non-commissioned officers—			
Staff.....	10	11	6
Companies, etc.....	43	48	77
Rank and file—			
Corporals, etc.....	40	32	70
Privates.....	480	415	934
Total.....	604	534	1133

It is to be observed that either of the above formations is augmented at once by the addition of privates, without any increase in the officers or non-commissioned officers. The new recruits, or men from the reserve, being distributed among the troops or companies, as many as 500 could be received without sensibly impairing the discipline of the regiment. See UNIFORM.

REGIMENTAL SCHOOLS are educational establishments, maintained by the state in every regiment, for the instruction of the soldiers and their children. There is a schoolmaster for the soldiers and elder boys; and a trained schoolmistress—usually the schoolmaster's wife—to teach the girls and infants of both sexes. Attendance at the schools is optional. Religious instruction takes place on Monday mornings, when children can be kept from school if their parents object to the instruction imparted. The girls' school comprises an "industrial" section for needlework, etc. The charge for regimental schools for the year 1876-77 was £36,415.

REGIOMONTANUS, the name adopted by an early German mathematician, called Johann Müller, probably because he was a native of Königsberg (of which *Regiomontanus* seems intended as a Latin equivalent), where he was born June 6, 1436. Which Königsberg, however, is to be understood is a disputed point among his biographers, but Delambre and others favor the one in Franconia. Regiomontanus was sent by his parents to Leipsic at the age of 12, and there made such rapid and extraordinary progress in mathematical studies that by the time he was 16 he could find nobody, it is said, in the Saxon university competent to give him further instructions. He therefore removed to Vienna, where, in 1461, he became professor of astronomy, but was permitted to reside in Italy for some time, in order to study Greek, with the view of making himself acquainted with the writings of the Alexandrian geometers and astronomers. He appears while here to have gone through a great amount of laborious work in the collection, collation, and copying of Greek MSS., in studying the language (under the best masters, such as Theodore Gaza), making astronomical observations, lecturing to the students of Padua on the Arabian philosopher Alfragan, and composing his celebrated work, *De Triangulis Planis et Sphericis* (first published at Nuremberg, 57 years after his death), which, according to Delambre, gives a very complete account of what was then known of plane and spherical trigonometry. In 1464 Regiomontanus returned to Vienna, where he remained for some years in the discharge of his duties as professor, but afterward removed to Buda, in Hungary, on the invitation of Mathias Corvinus. In 1471 he went to Nuremberg, where he lived in close intimacy with a wealthy and enlightened citizen, named Bernhard Walther, who furnished him, among other things, with means to start a book-printing establishment, and to construct various astronomical instruments, by which they were enabled to demonstrate the inaccuracies of the "Alphonsine tables." Their united labors are to be found in the *Observationes 30 Annorum à J. Regiomontano et B. Walthero* (Nuremberg, 1544). Regiomontanus now devoted himself vigorously to the composition of scientific works, among others, his *Kalendarium Novum* (ante 1475), which is thought to have been the first almanac that ever appeared in Europe. This last work excited great attention among the learned and powerful of the time, and the first edition was rapidly sold off. The king of Hungary presented Regiomontanus with a gift of 800 or 1200 golden crowns. Pope Sixtus IV. now sought his assistance in his meditated reformation of the calendar, and to secure his services conferred on him the dignity of archbishop of Ratisbon. He now left Nuremberg, and proceeded again to Rome,

where, however, he died, July 6, 1476, at the early age of 41. Regiomontanus's premature death was a serious loss to the science of mathematics. He is pronounced by competent authorities the most learned astronomer of his age; and his sagacity and ardor were such as to promise important acquisitions to our knowledge of celestial physics. A list of his numerous writings is given by Delambre in the *Biographie Universelle*.

REGIONS OF THE BODY, various portions of the surface of the human body into which it has been divided by anatomists for convenience of description. The system of division varies, sometimes being general, sometimes more or less specific, or minute. Thus, in general terms, we may speak of the thoracic region, implying the whole surface of the thorax, anterior, posterior, and lateral, or that portion of the body inclosed by the ribs, sternum, and dorsal vertebrae. A further division of the thorax includes that just named, as, anterior thoracic region, lateral thoracic regions, and posterior thoracic region. The anterior thoracic region is again subdivided into the sternal, or that part covered by the sternum bone (see **SKELTON**); two clavicular, those parts indicated by the collar bones, or clavicles; two subclavian, or those parts just below the clavicles; two mammary, or those regions corresponding to the breasts, and two infra-mammary, or regions just below the breasts (of course these double regions are named respectively right and left, as left mammary, right mammary region, etc.). The sternal region is again subdivided into upper and lower, and sometimes into upper, middle, and lower regions. The lateral thoracic regions are each subdivided into axillary, lateral, and lower lateral, and the posterior thoracic region is subdivided on each side of the spine into scapular, corresponding to the shoulder-blade; and inter-scapular, between the shoulder-blade and the spine. Sometimes another region is added, called the dorsal, corresponding to the base of the lung on each side, but sometimes the dorsal region is used in a more general sense, including a great portion of the posterior thoracic, on each side of the spine; and it may be remarked here that we are only sketching the most commonly adopted topography. These regions are not always very sharply defined, but the subclavian region may be said accurately to comprise that portion of either side of the thorax embraced between the clavicle, or collar bone, and the upper part of the fourth rib, and included laterally by the deltoid muscle and the sternum. Beneath it lies the upper lobe of the lung and the main bronchial tube, and on the right side, beside this, the descending vena-cava (see **CIRCULATION**), and a portion of the arch of the aorta. The mammary region extends from the fourth to the seventh rib, on either side, bounded laterally by the sternum and a line drawn vertically about 2 in. outside of the nipple. Beneath this region, on the right side, the lung occupies the whole space, and the sounds on percussion given by a healthy lung are clear, except at the very lower border, where the liver and diaphragm are very near and produce dullness. On the left side the lung is partly displaced by the heart, and consequently at this portion percussion elicits dullness of sound. This sketch of the thoracic regions will suffice for the use of the general reader, and to show the utility of such divisions. The lower part of the body is usually divided, in a general way, into abdominal, lumbar, and sacral regions, and in a still more general way may be added a pelvic region, although this would include portions of other regions. If a horizontal line is drawn round the body in a level with the lower end of the sternum (the ensiform cartilage) it will mark the superior boundary of the abdomen; and if another horizontal line is drawn on a level with the cartilages of the last false ribs, and still another on a level with the crests of the hip bones (ilia), three horizontal divisions or zones will be formed, one of them being below the lower (third) line. If now two lines, one on each side, are drawn from the upper horizontal line vertically downward to the end of the trunk, and between 3 and 4 in. on each side of the center (technically intersecting the middle of Poupart's ligament), each of the zones will be divided into three sub-regions. The three central regions, from above downwards are named epigastric, umbilical, and hypogastric, the epigastric lying over the stomach, and the hypogastric, (sometimes called the pubic) being the lowest central region. On each side of this central tier of regions there are, from above downward, the hypochondriac, the lumbar (sometimes called the iliac), and inguinal regions. These regions are of great importance in descriptive anatomy, and must be familiar to the surgeon as well as the physician. They ought also to be recognized by every well-educated person. Beneath the right hypochondriac region (called hypochondriac because beneath the cartilages of the false or floating ribs) is the right lobe of the liver, the gall bladder, the duodenum (see **DIGESTION**), the pancreas, and the upper part of the right kidney. Beneath the right lumbar region lies that part of the large intestine called the ascending colon, and also some convolutions of the small intestines. The ascending colon, and its pouch-like commencement at the termination of the ilium, the last division of the small intestines, are important divisions of the alimentary canal. Beneath the right inguinal region lies the lower, pouch-like end of the ascending colon (its commencement) before mentioned, and its attachment, the appendix vermiformis. Beneath the left hypochondriac region are the greater or splenic end of the stomach, the spleen (q. v.) and extremity of the pancreas (q. v.), the splenic flexure of the colon and the upper half of the left kidney. Beneath the left lumbar region lies the descending colon, the lower part of the left kidney, and some convolutions of the small intestines. Beneath the left inguinal region lies the sigmoid flexure of the colon (that part of it which is next the commencement of the

rectum) and the left ureter. See **URETERS**. The sacral region of the body corresponds to that portion of the pelvis called the sacrum, the lower portion of the spinal column. Besides the regions enumerated, there is the general cervical region (region of the neck), divided into anterior, posterior, and lateral cervical regions, whose locations are obvious. The head is generally divided into a cranial and a facial region. The cranial region is again divided into frontal, coronal, occipital, parietal, and temporal regions. Leaving the surface we also have the basilar region of the cranium, the floor of the skull, upon which the brain rests. See **SKELETON**. The facial region is divided into upper and lower facial. Passing to the upper extremities there are the acromial, or shoulder region, corresponding to the deltoid muscle; the anterior humeral region, corresponding to the front of the arm; and the posterior humeral region, corresponding to the back of the arm. We may also speak of the external and internal lateral humeral regions, to aid description. The brachial regions, anterior and posterior, are terms applied principally to the anterior and posterior aspects of the fore-arm, although the word brachium means the whole arm, from the shoulder to the wrist. We also have a radial region, corresponding to the radius, and an ulnar region, corresponding to the ulna. At the wrist is the carpal region, anterior and posterior; in the hand the dorsal or metacarpal (back of the hand), and the palmar regions. Passing to the lower extremities, in the hip there is the gluteal region (the buttocks), a portion of the iliac region (the hip and thigh joint), the anterior femoral region (the fore part of the thigh), the posterior femoral region (the posterior surface of the thigh), internal and external (lateral) femoral regions; popliteal region, immediately behind the knee joint; the anterior tibio-fibular region, the front aspect of the leg, corresponding to the shin; the posterior tibio-fibular region, corresponding to the calf and posterior aspect of the leg; the dorsal region of the foot, corresponding to the instep; and the plantar region, corresponding to the sole of the foot.

REGISTER, LORD, or LORD CLERK REGISTER, a Scottish officer of state who has the custody of the national archives. He was in former times the principal clerk of the kingdom, from whom all other clerks derived their authority. The office used to be held at pleasure, but since 1777 has been conferred for life. The lord register is assisted in his duties by a resident deputy.

REGISTER OF ORGAN, a name sometimes given to the sets of pipes or stops of an organ. See **ORGAN**.

REGISTERS OF VOICE, a term applied to the different kinds of sound distinguishable in the graduated scale of notes produced by any individual voice. Those sounds which, like the ordinary sounds of speech, proceed naturally and freely from the voice constitute what is called the *chest voice*. By means of a strained contraction of the glottis, notes may be produced of a higher pitch than those of the chest voice; these are called *falsetto* or *head voice*, and have a peculiar flute or flageolet-like quality of their own. Though often sweet and exceedingly pleasing, they cannot be used for a length of time without some amount of constraint or effort, and they are never so powerful, so open, or so impressive as the chest voice. The lower notes and, in most voices, by far the greater number of notes belong to the chest voice, the falsetto being only employed in the higher and highest sounds. The sounds produced by the head voice are called the *upper register*, those produced by the chest voice the *lower register*, of the voice; and such notes of the chest voice as may also be produced by the falsetto are said to belong to the *middle register*. In a properly trained voice the falsetto is so blended with the chest voice that there is no perceptible break between them.

REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES is an improvement introduced in modern times, and ingrafted on the law and social customs of the United Kingdom for the purpose of keeping an exact account of important facts connected with the population of the country and its social progress. In England the first act for this purpose was passed in 1836, and a general registry-office was provided in London (at Somerset house) for England and Wales. But even before the new arrangement there had been long in operation an ecclesiastical mode of registration of marriages, baptisms, and burials in connection with each parish church, the officiating minister being required to keep such a register. By that act, which still retains its force as to baptisms and burials, registers of public and private baptisms, and burials solemnized according to the rites of the Established church in any parish or chapelry, are to be kept, and entries made by the minister within seven days at most after the ceremony. These registers are to be transmitted annually to the registrar of the diocese, who keeps the same and allows inspection on payment of certain fees—severe penalties being incurred by any one who forges or injures the register. This mode of registration was found to be insufficient for statistical purposes, for it was confined only to births and deaths so far as the ceremonies of the church extended; and hence a systematic plan was instituted in 1836 by the acts 6 and 7 Will. IV. c. 85, 86, which have been since amended by subsequent acts. The head of the office is the registrar-general. Every poor-law union throughout the country was subdivided into districts for the purposes of the acts. In each district a registrar, locally resident, is appointed, and a superintendent registrar is put over these.—1. As regards *births*, it is the duty of the registrar to inform himself of every birth that takes place in his district, and to record the particulars without fee or

reward except such as the act authorizes him to take. The forms of the register-books are all settled by the act of parliament, and include a statement of the date of birth, name (if any), sex; name and surname of the father, and name and maiden surname of the mother; rank or profession of the father; signature, description, and residence of the informant; date of registration; signature of registrar; and baptismal name of child, if added after registration. It is not incumbent on the parent or occupier of the house where the child is born to give information; but upon being requested to do so, they are bound, within forty-two days after the birth, to give the particulars touching the birth to the registrar. In case of foundlings, alive or dead, and children born in workhouses, jails, etc., the overseers, coroner, master or jailer, respectively, must give such particulars. No fee is payable by the parent, etc., who gives information within the forty-two days. After that period any person present at the birth, or the father or guardian, may, within six months, make a solemn declaration as to the truth of the particulars, and require the particulars to be registered; but he must pay a fee of 7s. 6d., unless the delay was not occasioned by the party's fault. If registration is required to be made after forty-two days, and within six months, except as now stated, the party incurs a penalty of £50. After six months from the birth the registrar is not allowed to register the birth, under a penalty of £50, unless the child was born at sea.

2. *Marriages*.—With regard to marriages which are performed in the Established church, every officiating clergyman is required, immediately after the office of matrimony solemnized by him, to register in duplicate the marriage according to a form prescribed by the statute, and one of the duplicates is to be forwarded to the superintendent-registrar. The form states the date of marriage; the name and surname of each of the parties; the age as to minority; condition as to previous marriage; rank or profession; residence of each at the time of the marriage; and the name, surname, and rank or profession of the father of each of the parties. Every marriage in England which does not take place in a parish church or chapelry of the Established church must take place either in a registered building—and most of the chapels of dissenters are so registered—or in the office of the superintendent-registrar. In the two latter cases it is necessary that the registrar be present in the registered building at the time, or that the superintendent-registrar be present in his office at the time with witnesses. In such cases the registrar or superintendent-registrar himself registers the marriage so celebrated.

3. As to *deaths*, every registrar is required to inform himself carefully of every death within his district, and he is bound to enter the particulars in the form required by statute. The form contains a statement of the date of death, name and surname, sex, age, rank or profession, cause of death, name and residence of the informant, and date of registration. The occupier of the house in which the death occurs, if none of the parties present at the death shall have previously informed the registrar, must, within eight days after the death, on being requested, give such information. Four times every year, the district-registrar sends a certified copy of all the deaths to the superintendent-registrar, and when the book is filled, he sends the book itself. These are sent on, and kept in the general register-house in London. Besides the registers kept since the passing of the act in 1836, many of the older registers have been collected, and put under the care of the registrar-general. At the general office in London, indexes are kept of all the certified copies of the registers, and every person is entitled, on payment of a fee, to search them, and have a certified copy. For a general search of all these indexes, a fee of 20s. is paid; for a search of a particular index, 1s. is paid, and 2s. 6d. for a certified copy. This certified copy is sealed with the seal of the office, and is evidence in all courts. During the time the register is in the hand of the superintendent-registrar, he is bound also to keep an index, charging a fee of 5s. for a general search, and 1s. for a particular search.

In Ireland the system of registration of births, deaths, and marriages was introduced in 1833. By the statute 26 and 27 Vict. c. 11, a statute passed relating to births and deaths, a general register-office was provided in Dublin, and a registrar-general appointed. The country was subdivided into districts. The provisions of the English act are imitated, except that parents and occupiers of houses are bound to furnish the information of births within three months. A penalty of 20s. is incurred by parents, occupiers, or persons present, who neglect to give notice of the births and deaths; but the penalty is not incurred if the omission was accidental or not wilful. By a statute of the same year (23 and 27 Vict. c. 27), the minister neglecting or refusing to register a marriage, is liable to a penalty of £40; and in other cases, the registrar is bound to register it. By 26 and 27 Vict. c. 90, a like provision is made for a general register of marriages.

In Scotland a system of registration of births, marriages, and deaths was introduced in 1854, by the act 17 and 18 Vict. c. 80. A registrar-general and a registry-office are provided in Edinburgh; the parochial board of each parish appointing the parish registrar, subject to the sheriff altering or combining districts. Similar provisions are made by that act and the subsequent acts of 18 and 19 Vict. c. 29, and 23 and 24 Vict. c. 85. Owing to the difficulty of discovering regular and irregular marriages, detailed provisions are required, and the husband, or, in his default, the wife, is, under a penalty of £10, bound to send the particulars. The details of the Scotch acts secure more accurate statistics than the English acts, particularly as regards illegitimate births.

REGISTRATION OF DEEDS AND WRITS, in the law of Scotland, is an important feature of the administration of the law. The general registration is authorized either by virtue of a clause of registration inserted in a particular deed, or under the old act of parliament of 1698, c. 4, which applies to all probative writs whatever. The clause of registration arose from the practice of churchmen drawing the enforcement of ordinary contracts within their jurisdiction, by causing the parties to consent that the court should, as it were, execute diligence at once if the obligation were not fulfilled. The clause used to be in the form of an authority given to a procurator to go before a judge, and consent to a decree in terms of the obligation; but it is now enough to use this form: "I consent to the registration hereof for preservation (or for preservation and execution)." Hence, when money is not paid at the time appointed, diligence issues at once on application of the creditor for execution. The practice is now almost universal to insert a clause of registration in deeds stipulating for money payments, especially bonds. When there is a clause of registration, the principal deed is retained in the register, and an attested copy or extract, authenticated by the clerk, and authorizing diligence, is given out, and a copy of the deed is entered in a book. When the deed has no clause of registration, it is recorded as a probative writ only, and the principal deed is marked by the clerk, and returned with a certified copy, a copy being also kept in the record. The registration, under authority of a clause of registration, is called a registration for execution, and is in effect a short cut to a judgment without the formality of an action, and the registration may take place after the death of the creditor as well as of the debtor. The other registration is usually called a registration for preservation, the object being merely safe custody; but the extract or copy kept in the register is allowed to be evidence in all cases except where there is an action of improbation to reduce the original deed for forgery. The general register is separate from that of deeds containing clauses of registration, and is applicable to all writs of which it is useful to preserve a copy.

Another class of registers has for its object publication to all the lieges, which is effected by allowing inspection to the public, and these writs are those connected with heritable rights, being used by all who lend money on land, or purchase land. There is under this class (1) a register of sasines—i.e., of the final deeds completing the title to property, and vesting it in the owner; (2), a register of entails—i.e., of deeds which perpetuate the enjoyment of land by a specified class of heirs; (3), a register of interdictions—i.e., by which a proprietor of heritage limits his own power of alienation; (4), a register of adjudications—i.e., transfers by operation of law; (5), a register of inhibitions—i.e., of diligence restraining an owner of land from alienating it to the prejudice of creditors; (6), a register of inventories, by which heirs limit their liability to the amount of their ancestors' assets. By the combined effect of these registers, the state of heritable property, as affected by incumbrances, is displayed to all parties who are interested in ascertaining that fact, and the practice has been found of great benefit to the landowners of Scotland. Besides the general registers for all Scotland, there were once local registers in every county and burgh for similar purposes; but since 1871 only indexes and abridgments are sent to each county, and the deeds themselves, except in burghs, must be registered in the general register house in Edinburgh. The general result of the Scotch registration system is, that deeds and all other writings may be registered for preservation either in the central register in Edinburgh, or in the burgh registers; that deeds containing clauses of registration with consent of execution, as well as protests of bills of exchange, may be registered for preservation and also for execution in the books of council and session, or in the registers of the subordinate courts; and that all deeds, instruments, and proceedings affecting heritable property must be registered, so that any one can ascertain the burdens affecting it, by inspecting the burgh register as to burgh property, and as regards all other property by inspecting the general register in Edinburgh, where the whole of the general and local deeds can be found concentrated. At the head of the management of these public registers is the lord clerk register, by whom and by his deputy and officers the details of registration are carried out. The general register house in Edinburgh, in which are collected all these records, was completed in 1787, a general principle of the management being, that the formation of the records is intrusted to one set of officers, and the safe custody of them to another set, so as to provide a better check on the whole process.

REGIUM DONUM (Lat. royal gift), an annual grant of public money formerly received by the Presbyterian ministers in Ireland. It began in 1672, when Charles II. gave £600 of secret-service money to be distributed annually among the Presbyterian clergy in Ireland, on hearing that they had been loyal to him, and had even suffered on his account. The grant was discontinued in the latter part of the reign of that monarch, as well as in the time of James II., but was renewed by William III. in 1690, who increased it to £1200 a year. It was further augmented in 1723 by George I., in consequence of the Presbyterians having supported the house of Brunswick; raised to £2,200 in 1784, and to £5,000 in 1792. The amount of the grant for 1863 was £39,746. The grant was at one time shared in by other dissenting ministers, but was latterly confined to the Presbyterian body. The propriety of receiving the regium donum was much disputed by those of the same persuasion in England and Scotland. The regium donum

was withdrawn by the act of 1869, which came into force Jan. 1, 1871, disendowing the Irish Episcopal church.

REGIUS PROFESSOR, the name given to the professors in the English universities whose chairs were founded by Henry VIII. In the universities of Scotland, those professors are called regius professors the patronage of whose chairs is vested in the crown.

REGLET, a flat narrow molding rising equally on both sides. It is used to separate panels, and to form frets, etc.

REGNARD, JEAN FRANÇOIS, 1655-1709; b. Paris; visited Italy 1676-78, where he met the Eloise of his posthumous novel *Le Provençale*. Taken prisoner by Algerine pirates, he was a captive in Constantinople for two years. He afterward traveled over the n. of Europe. As a dramatist his rank in France is second to that of Molière only. His best pieces are *Le Joueur*, which depicts the vice of gambling, to which he was himself addicted; and *Le Legataire Universel*. His *Les Ménéchmes* is dedicated to Boileau, as a mark of the reconciliation which had been effected between them after a long literary controversy. Besides comedies, he wrote an opera, a tragedy, epistles, and satires.

REGNAULT, HENRI VICTOR, a distinguished recent French chemist and physicist, was born at Aix-la-Chapelle in 1810. While still very young, he was left to provide for himself and his sister, came to Paris, and became a shopman in a bazaar. He made such good use of his scanty leisure, that he qualified himself for admission (in 1830) to the école polytechnique, and, after the two years' course, came out as a mining engineer. He became a professor in Lyon, whence, in 1840, he was recalled to Paris as a member of the academy of sciences, in consequence of some important discoveries in organic chemistry. Having filled chairs in the école polytechnique and the collège de France, he became, in 1854, director of the imperial porcelain manufactory at Sèvres.

He was distinguished for extreme skill and patience in experimental work, more than for brilliance or novelty in discovery; and devoted himself especially to the determination of important physical data, such as the laws of expansion of gases, the measurement of temperature, latent and specific heats, etc. His greatest work is that on the numerical data bearing on the working of steam-engines, for which the royal society of London awarded him their Rumford medal. He also received the Copley medal (1869) of the royal society, and was one of its foreign members. In addition to numerous papers in the *Annales de Chimie*, etc., he published a *Cours Élémentaire de Chimie* (4 vols., 14th ed. 1871). He died in Jan., 1878.

REGNAULT, JEAN BAPTISTE, Baron, 1754-1829; b. Paris; visited Africa and America as a sailor, and afterward studied painting with Bardin. His "Alexander and Diogenes" won the grand medal in 1774. Among his most famous works are "Perseus and Andromeda," 1782; and "Cupid and Psyche," 1829.

REGRA'TING. See ENGRASSING.

REGULA, a band under a triglyph (q. v.) in the Doric style, or the bands between the canals of the triglyphs

REGULAR CANONS (Lat. *canonici regulares*, canons bound by rule), the name given after the reform introduced into the system of cathedral clergy in the 11th c., to the members of those canonical bodies which adopted that reform. They were thus distinguished from the so-called "secular canons," who continued exempt from rule, and who are represented down to modern times by the canons, prebendaries, and other members of cathedral chapters, in those churches in which the full cathedral system of the Roman Catholic church is maintained. The rules of the regular canons being variously modified in different countries and ages, a variety of religious orders arose therefrom, Augustinians, Premonstratensians, etc. See CANONS, AUGUSTINES.

REGULAR PLANE FIGURES are those surfaces whose perimeters are equilateral and equiangular polygons. They are named according to the number of sides which compose the perimeter, being triangles, squares, pentagons, hexagons, etc., according as they have 3, 4, 5, 6, etc., sides respectively; and to all except the square (q. v.) the prefix "regular" or "equilateral and equiangular" is applied, to distinguish them from other plane figures which have an equal number of sides, but have not all the sides and angles equal. Circles can be inscribed in and described about all regular figures. See POLYGONS. *Regular bodies, solids, or polyhedrons* are those solids whose sides are plane figures, all the plane figures being equal, similar, and regular. The number of such bodies is necessarily very limited; in fact no more than five such bodies are possible. They are the tetrahedron, hexahedron or cube, octahedron, dodecahedron, and icosahedron. The sides or faces of the first, third, and fifth of these solids are equilateral triangles; those of the second are squares; and those of the fourth are regular pentagons. From these 5 regular solids having been treated of, or described by Plato, they are generally known as the platonic bodies, or Plato's 5 solids.

REGULARS—REGULAR CLERGY (Lat. *regulares*, from *regula*, "persons bound by rule"), a name used to designate that portion of the clergy, in the Catholic church, who belong to the monastic orders or religious congregations, and thus live under an established rule, commonly including the three vows of poverty, chastity, and obedience. The name regular is employed in contradistinction to "secular," the term applied to the

clergy who are employed in the ordinary parochial duties, or at least who are not withdrawn from liability to such duties, by being subject to any religious rules or constitutions. The name, therefore, comprises all friars, monks, regular canons, clerks of the missions, and, in general, all members of clerical congregations who live under an approved rule.

REGULATIONS, MILITARY AND NAVAL, are the official codes of rules for the guidance of officers in all the cases where uniformity of practice is requisite, and which cannot rightly be left to individual discretion. Regulations may be divided into 3 classes: viz., those affecting drill, discipline, and finance. Of the first class are such as cavalry regulations, infantry field manual, naval gun-drill, etc. Of the second are the mutiny act (q.v.), articles of war (q.v.), and queen's regulations (q.v.). The third class are represented by the war-office regulations, purveyors' regulations, explanatory directions for paymasters, navy paymasters' regulations, etc. All these are continually supplemented and altered by circulars.

REGULUS. See GOLDEN-CRESTED WREN.

REGULUS, a term in metallurgy, which is now used in a generic sense for metals in different stages of purity, but which still retain, to a greater or less extent, the impurities they contained in the state of ore. When, for example, the ore known as the sulphuret of copper is smelted, the product of the different furnaces through which it passes is called regulus until it is nearly pure copper. The name, which signifies "little king," was first given by the alchemists to the metal antimony, on account of its power to render gold brittle.

REGULUS, MARCUS ATILIUS, a favorite hero with the Roman writers, was consul for the first time 267 B.C., and for his successes against the Sallentini, obtained the honor of a triumph. Chosen consul a second time 256 B.C., he was sent along with his colleague L. Manlius Vulso at the head of a navy of 330 ships (with a land army on board) against the Carthaginians, it being the 9th year of the first Punic war, and encountering the enemy's fleet off Heraclea Minor, he totally defeated it. The Romans then landed near Clypea, where they established their headquarters, and ravaged the surrounding Carthaginian territory with fire and sword, but Manlius being recalled to Rome with one half of the land forces, Regulus was left to carry on the war with the remainder. For some time he was victorious in every encounter, but at last (255 B.C.) suffered a total defeat; 30,000 Romans were left dead on the field, about 2,000 fled and took shelter in Clypea, and Regulus, with 500 more, was taken prisoner. Regulus remained in captivity for five years, but when fresh reverses induced the Carthaginians to solicit peace, Regulus was released on parole and sent to Rome in company with the Punic envoys. The rest of his history is one of the most favorite of Roman tales. It is related, *con amore*, by the Roman poets and historians, as an instance and a model of the most supreme heroism, how Regulus at first refused to enter Rome since he was no longer a citizen; how, after this conscientious scruple was overcome, he declined to give his opinion in the senate, till that illustrious body laid upon him its commands to do so; how he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners (though no reason appears why such an exchange should not have been effected); and how, after he had succeeded by his earnest appeals, in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Carthage, where the rulers, maddened by the failure of their schemes through his instrumentality, put him to death by the most horrible tortures. The common story is, that he was placed in a cask or chest stuck full of nails with the points projecting inward, and rolled about till he expired; and on the news of this event reaching Rome, retaliations equally atrocious were committed on two of the noblest Carthaginian prisoners. Unfortunately this noble instance of heroic patriotism and unflinching fortitude has not even been noticed by Polybius (about 200 B.C.), who details at great length the other achievements of Regulus; and Palmerius (Paulmier de Greutesmesnil) and Beaufort, two eminent historical critics, have adduced strong reasons for the story being merely invented for the purpose of excusing the horrible treatment of the captive Carthaginians. Niebuhr roundly declares it to be a forgery, and believes that Regulus died a natural death; though, excepting the silence of Polybius (which would be utterly unaccountable on the supposition of the mode of his death being the same or similar to what is stated in the common account), there appears to be no reason to doubt the statement in which all the other Roman historians agree, that he was put to death by the Carthaginians.

REGUR, the native name for the cotton-soil of India. It is a rich darkish loam, which has yielded a constant succession of crops—one of cotton, and two of corn—for 20 centuries. It covers extensive level tracts in the southern peninsula, varying from 3 to 20 ft. in thickness.

REI, REE, or REA, the nominal unit of account in Portugal and Brazil, but no longer existing as a coin; multiples of it, however, still form the authorized coinage in both countries. In Portugal, copper pieces of 5, 10, and 20 (*vintem* = 1d. nearly) reis, silver coins equivalent in value to 50, 100 (*testoon*), 200, 480 (*cruzado novo*), 500, and 1000 (*mil*).

reis) reis, and gold pieces of 1000, 2,000, 4,000 (*moeza dowro*), 5,000, 6,400, 10,000 (gold crown), and 12,800 (*dobra*) reis, are the current coin of the realm; but accounts are kept almost exclusively in milreis and reis. The milrei in Brazil is, however, only equivalent to about 2s. 3d. sterling; while that of Portugal is fully twice this value, the exchange at present being about 4s. 7d. sterling. Gold and silver coins have almost disappeared in Brazil, the circulating medium consisting of notes of a milrei and upward, together with copper and bronze coins.

REICHENBACH, a flourishing manufacturing t. of Saxony, 11 m. s.w. of Zwickau. It contains several wool and cotton mills, stoneware and other factories; and produces extensively woollen fabrics, leather, nankeens, lace dresses, damask napkins, waistcoatings, and hosiery. The greater part of the machinery in the town and vicinity is driven by steam. Pop. '75, 14,620

REICHENBACH, a t. of Prussian Silesia, on the right bank of the Peilbach, romantically situated at the foot of the Eulen mountains, 46 m. by railway s.e. of Liegnitz. It contains 6 cotton factories, and carries on linen and woollen manufactures, yarn bleaching, dyeing, and printing. Pop. '71, 6,938; '75, 7,267.

REICHENBACH, KARL, Baron von, a German naturalist and technologist, was b. at Stuttgart, the capital of Württemberg, Feb. 12, 1788, and educated at Tübingen, where he received the degree of PH.D. Soon after he conceived the project of founding a new German state in the South sea, but his plans were watched by the French authorities, and being suspected to have some hidden political significance, their author was arrested and imprisoned for some time in the fortress of Hohenasperg. On his release he turned his attention to the natural sciences, and their application to the industrial arts, visiting the principal manufactories of Germany and France, and on his return he established at Villingen and Hausach kilns for the production of wood-charcoal. In 1821, in connection with Hugh count of Salm, he commenced a number of manufactories of different kinds at Blansko in Moravia, which were carried on under his own superintendence. Reichenbach's management was so economical and effective, that the concern soon became extremely profitable; and Reichenbach, after a few years, was the possessor of a handsome fortune, which he invested in the purchase of large estates, including the château of Reisenberg, where he kept his magnificent collection of meteorites; he was about the same time created a baron by the king of Württemberg. Reichenbach's position as manager of the works at Blansko afforded him valuable opportunities, which were not neglected, for scientific investigation, and the numerous new facts thus brought to light have been of great value to science and art. From the nature of the works, the objects which chiefly presented themselves to his investigation were the compound products of the distillation of organic substances, and by careful analysis he succeeded in bringing to light a number of compounds of carbon and hydrogen not previously known. Among these were creosote (1833) and paraffine (q.v.). In later years he lunched out into speculations of a wholly different character. Studying with enthusiasm the subject of animal magnetism, he discovered, as he thought, a new force in nature. See *Od*. His chief literary works are: *Geologische Mittheilungen aus Mähren* (Vienna, 1834), the first geological monograph published in Austria; *Physikalisch-physiologische Untersuchungen über die dynamide des Magnetismus und der Electricität, und ihre Beziehungen mit der Lebenskraft* (Brunswick, 1847-49); several other works on "odde force," published at Stuttgart between 1852 and 1858; several papers in the *Neues Jahrbuch der Chemie und Physik; Kohlerglaube und Aferreissenscraft* (1856), in reply to a work of Karl Vogt; *Aphorismen über Sensibilität und Od* (1866); *Die Odtsche Lohle* (1867). Reichenbach died at Leipsic, Jan. 19, 1869.

REICHENBERG, after Prague the largest t. in the kingdom of Bohemia, stands in the middle of the most populous and industrious district of the Austrian monarchy, in a romantic valley on the Neisse, 52 m. n.e. of Prague. Linen, cotton, and woollen fabrics are manufactured extensively, as well as fire-arms, hats, leather, shoes, gold and silver wares, musical instruments, etc. During the Austro-Prussian war of 1866 Prince Frederick Charles had his head-quarters at Reichenberg. Pop. '69, 22,394.

REICHENHALL, a small t. of Bavaria, on the Saal, 8 m. s.w. of Salzburg. It was almost wholly consumed by fire in 1824, and has been handsomely rebuilt since that time. It is the center of the Bavarian salt-works, and in the manufacture of salt, its inhabitants—71, 3,312 in number—are for the most part employed. Of its 18 salt-springs, which burst forth about 50 ft. below the surface of the ground, and to which a spacious shaft has been sunk, some are so strong in the brine as to be fit for boiling at once; but generally speaking, they are subjected to a preliminary evaporating process. The strongest and most abundant spring, containing 24 per cent of salt, and yielding 3,300 cubic ft. of water every 24 hours, is perhaps the most copious salt-spring in the world. From it alone about 200,000 cwts. of salt are obtained annually. A brine conduit, 60 m. in length, conveys the water of salt-springs from Berchtesgaden, through Reichenhall, over mountains nearly 2,000 ft. high, to Traunstein and Rosenheim, in the vicinity of which abundant timber for fuel is procurable.

REICHSTADT, NAPOLEON FRANÇOIS CHARLES JOSEPH, Duke of, described by the Bonapartists as NAPOLEON II., was the son of the first Napoleon by Maria Louisa of

Austria, and was born at Paris, Mar. 20, 1811. His father's joy at his birth was unbounded. "C'est un roi de Rome," he cried to the crowd of congratulators who pressed into his apartments on hearing the news. The infant prince was baptized on June 9, in the cathedral of Notre Dame, by cardinal Fesch. After the reverses of 1814, Napoleon, it will be remembered, abdicated in favor of his son, but the senate took no notice of Napoleon II., and called Louis XVIII. to occupy the French throne; whereupon Maria Louisa and her child removed to the palace of Schönbrunn, near Vienna, where they remained till the treaty of Vienna had re-arranged the affairs of Europe. Maria Louisa then proceeded to take possession of the sovereign duchy of Parma, which had been conferred upon her, while her son continued to reside at the Austrian court with his grandfather Franz I., who was much attached to him. By an imperial patent, dated July 22, 1818, he was created duke of Reichstadt, with the rank of an Austrian prince, and received a liberal education, but never enjoyed robust health, nor exhibited a vigorous intelligence. At the July revolution in 1830 his name was mentioned as a candidate for the French throne, and Talleyrand, it is even believed, proceeded to Vienna for the purpose of advocating his cause, but was coldly received, and the project dropped. Destiny had indeed determined otherwise. The constitution of the poor youth was utterly undermined by laryngeal phthisis, and July 22, 1832, he expired at Schönbrunn. His last words, addressed to his mother, were very touching as an expression of almost childish despair, "Ich gehe unter, meine Mutter, meine Mutter!" He was interred with magnificent pomp in the imperial tomb at Vienna.

REID, MAYNE, b. Ireland 1818; educated for the church, but the thirst for adventure induced him to set out for Mexico. In 1838 he visited New Orleans, and made several hunting and trading excursions among the Indians, gaining that knowledge of scenery, manners, and characteristics which he has since used to advantage in his *Scalp-Hunters*, *White Chief*, and many other romances. He devoted five years to travel in the United States; in 1845 obtained a commission, and served with distinction in the Mexican war. While in this country he contributed largely to the magazines, and established an unsuccessful periodical called *Onward*. In 1849 he organized a body of men in New York, to proceed to Hungary, to aid in the struggle for independence, but on reaching Paris he received the news of the total failure of the Hungarian insurrection. Capt. Reid has since lived in England, where he has devoted himself to literature, and has started several periodicals. Among his many works are *The Rifle Rangers*; *Desert Home*, or *Family Robinson*; *The Boy Hunters*; *The War-Trail*; and *Green Wynn*, a romance of the Wye.

REID, THOMAS, was b. April 26, 1710, at Strachan, a country parish in Kincardineshire, where his father was minister. His mother belonged to the well known family of the Gregories (q. v.). Reid began his education at the parish-school of Kincardine, and at the age of 12 he became a student of Marischal college in Aberdeen. His master in philosophy was Dr. G. Turnbull, one of the earliest representatives of the properly Scottish school. He took his degree of M. A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the philosophy of Newton. In 1736 he left Aberdeen, and went, in company with a friend, to England, where he was introduced to the most distinguished men in Oxford, Cambridge, and London. In the following year he was presented by the senatus of King's college to the parish-church of New Macliar in Aberdeenshire. The parishioners were bitterly opposed to his appointment, but his conduct and manner gradually won them over. It is said that, from distrust of his powers, instead of composing for the pulpit himself, he preached the sermons of the English divines Tillotson and Evans. In 1740 he was married to a cousin of his own, who greatly aided him in the work of his parish. In 1739 Hume's *Treatise on Human Nature* appeared; the perusal of which gave the impulse that determined his future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world. In 1784 he contributed to the royal society of London a short essay on *Quantity*, occasioned by what he considered an abusive application, by Hutcheson, of the forms of mathematical reasoning to ethics. In 1752 he was appointed one of the professors of philosophy in King's college, Aberdeen, the senatus being the patrons of the chair. Here he followed the established course of teaching in three successive years to the same students, mathematics, natural philosophy, and moral philosophy. He took an active part in all the business of the university. He was also the founder of a literary society in Aberdeen, which enrolled among its members, Campbell, Beattie, Gerrard, and other men of ability; to this society he submitted his first draft of the *Inquiry into the Human Mind*. In 1763 he was chosen to succeed Adam Smith as professor of moral philosophy in the university of Glasgow. He was now rescued from the necessity of teaching physical science, and devoted himself thenceforth to metaphysical and mental speculations. In 1764 he published his *Inquiry*. His thirst for general science never left him; at the age of 55, he attended Black's lectures on heat. He continued in the duties of his chair till 1781, when he retired to devote his remaining strength to the publication of his works on the mind. In 1785 the *Philosophy of the Intellectual Powers* appeared; and in 1788 the *Active Powers*. These treatises must always be looked upon

as constituting the first complete and systematic work on the science of the human mind. In 1774 he had contributed his account of Aristotle's logic to lord Kames's *Sketches*. The publication of the *Active Powers* was the close of his career as an author, although to the end of his life he kept up his bodily and mental vigor, and his interest in science. His only surviving daughter had married the son of Gershom Carmichael (the real founder of the Scottish school of philosophy); she it was that, after the death of his wife, in 1792, cared for him in his last years. He was taken ill suddenly in the autumn of 1796, and died Oct. 7. He was under the middle size, but had great muscular strength, and was addicted to exercise in the open air.

Reid had many points of resemblance to his great contemporary Kant. Both were occupied up to middle life with mathematical and physical studies; both were roused to metaphysical research by Hume, and each became in his own country the chief of a school whose aim was to deliver philosophy from skepticism, and to do so by resting finally on principles of intuitive, or *a priori* origin.

Reid's refutation of Berkeley, notwithstanding the powerful support of Hamilton, is now considered by many to be a failure. His own account of the motives that led him to abandon idealism proves that he completely misconceived the real drift of that famous speculation.

REID, WHITELAW, b. Ohio, 1837; graduated in 1856 at Miami university; was superintendent of public schools in South Charleston, Ohio, and then editor of the *Xenia News*, which he purchased about 1858, and which was one of the earliest newspapers in the west to advocate Mr. Lincoln for the presidency. In the winter of 1860-61 Mr. Reid was in Columbus, Ohio, as a correspondent, and next became city editor of the *Cincinnati Gazette*, and acted as war-correspondent of that paper in 1861, his vivid descriptions of battles which he witnessed gaining for him a wide reputation as a writer of remarkable brilliancy. He was attached to the staff of gen. Rosecrans, was present at the battle of Pittsburg Landing, and in the spring of 1862 was sent to Washington by the *Gazette*. He was appointed librarian to the house of representatives, was present at, and wrote a graphic description of, the battle of Gettysburg, and had by this time become recognized as one among the few leading war-correspondents of any nation. In 1865 he traveled through the south with hon. Salmon P. Chase, and described the condition of that section in his *After the War*. He was for two years a cotton-planter in Alabama and Louisiana, but in 1863 became one of the principal editors of the *Cincinnati Gazette*. He had already (in 1862) been offered by Mr. Greeley a position on the editorial staff of the *New York Tribune*; and this offer being renewed in 1869, it was accepted, and Mr. Reid became managing editor of that journal. He was editor-in-chief while Mr. Greeley was running for the presidency in 1872, and on the death of the latter became proprietor of the *Tribune*, a position which he still occupies. Mr. Reid has become prominent in a charitable movement originating with some benevolent person whose name has not been made public; and, as his almoner, has expended large sums and given much time and labor in sending New York street-boys to the west, and placing them in positions there, among the farming population. In dispensing this charity he has been remarkably successful. He should also be credited with the accomplishment of the difficult task of sustaining the *Tribune* at a high point of success, in the face of more than ordinary obstacles; and particularly that of the loss of Mr. Greeley, who was identified with that paper from its foundation, and whose relations to the American public were calculated to make his death ruinous to its future career.

REID, SIR WILLIAM, 1791-1853; b. Scotland; entered the army, served in the peninsula in the war of 1812, at the battle of Waterloo, and in the attack on Algiers in 1816. He was governor of Bermuda 1838-46, and of the Windward Islands 1846-48, when he returned to England, and became engineer in command at Woolwich. He was chairman of the executive committee of the great exhibition of 1851, governor of Malta 1851-58, and was appointed maj. gen. in 1856. He wrote *An Attempt to Develop the Law of Storms*, etc., 1838; and *The Progress of the Deceleration of the Law of Storms*, 1849.

REIGATE, a municipal borough and thriving market t. of Surrey, pleasantly situated at the southern base of the North Downs, 23 m. s. of London by the South-eastern railway. From very early times it was considered a place of strength; and after the conquest it was granted to the earls of Warrenne. Of the castle built by these earls, only very slight vestiges remain; but beneath the site are several large vaults or caverns, excavated in the sandstone not earlier than the 13th century. The church is in various styles of architecture—the oldest portions dating from the 12th century. Under its chancel is buried Charles Howard, earl of Effingham, Elizabeth's lord high admiral, and the conqueror of the Spanish armada. Reigate formerly returned a member to parliament, but was disfranchised in 1867. Pop. '61, 9,975; '71, 15,916.

REIGN OF TERROR, the name given to that period in the history of France when the revolutionary government, under the guidance of Maximilien Robespierre, supported itself by the pure operation of terror, exterminating with the guillotine all the enemies, or supposed enemies, of the democratic dictatorship. In the year 1793 the convention vested the government in a "committee of public safety," a body belonging to the party of the Mountain, and of which Robespierre, Couthon, and St. Just became the triumvirate. This committee, to which every other authority in the country was

subjected, deliberated in secret, and the convention sanctioned all its decrees. Louis XVI. had already been brought to the scaffold; and on Oct. 16 his queen, Marie Antoinette, after being subjected to every possible indignity, was beheaded; the princess Elizabeth sharing the same fate on May 10, 1794. The execution of the Girondists (q.v.) followed, and that of the duke of Orleans. The guillotine became the only instrument of government: a look or a gesture might excite suspicion, and suspicion was death. The calendar was remodeled, and all religious rites suppressed. When the power of the committee had attained its climax, a decree was passed abrogating every delay or usage calculated to protect an accused person; but from that moment a reaction began. A section of the mountain party were satiated with blood, and had become impatient of the control of Robespierre. On July 28, 1794, he was denounced in the convention for his barbarities, and his death (see ROBESPIERRE) brought to a close this sanguinary era in French history.

REI'KIAVIK. See ICELAND.

RÉ ILE DE (*Rex insula*) is a small island on the coast of the French department of Charente Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton. It is about 18 m. long, and 4 m. broad. It contains 5,600 inhabitants, most of whom are engaged in fishing. The island is skirted by high cliffs, and strongly fortified by four forts. It has several good harbors and two light-houses; but there are neither springs nor wood on the island, and next to fishing, the culture of the vine constitutes the chief occupation of the islanders. Brandy made from the wines of Ré, and sea-salt, are the principal articles of the trade of the island. St. Martin, which ranks as the capital of Ré, is a well-fortified little town with a good harbor, is the chief seat of the trade, and has (1872) 1916 inhabitants. Oyster-farming has of late become an important branch of industry. See OYSTER.

REIMARUS, HERMANN SAMUEL, a German philologist of high eminence, was b. in 1694 at Hamburg, where his father was professor at the Johanneum gymnasium. He visited the universities at Jena and Wittenberg, traveled afterward in Holland and England, and was, on his return, elected rector at Wismar, and subsequently professor of Hebrew and mathematics at the gymnasium of Hamburg. He died there in 1765. He is the author of the so-called *Wolfenbüttelsche Fragmente eines Unbekannten*, first published by Lessing in his *Beiträge zur Geschichte und Literatur aus den Schätzen der Wolfenbüttelschen Bibliothek*. These *Fragmente*, up to that time only known in MS. by a few of Reimarus's most intimate friends, produced the profoundest sensation throughout Germany: since in them, the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. Another work, in the same direction, is his *Vornehmste Wahrheiten der Natürlichen Religion*; of a miscellaneous character are his *Primitia Wismariensis*; *De Vita Fabricii*; *Dissertatio de Assessoribus Synedrui Magri*; etc. His edition of *Dio Cassius* is one of the most valuable contributions to classical philology.

REINDEER, *Cervus tarandus* or *Tarandus rangifer*, a species of deer (q.v.), a native chiefly of the arctic regions; by far the most valuable and important of all the species of deer, and the only one which has been thoroughly domesticated and brought into service by man. It is found wild in Europe, Asia, and America, in Spitzbergen, and in Greenland. It is not, however, a native of Iceland, but was introduced into that island by governor Thodal in 1770, and soon became thoroughly naturalized; great herds now roaming over the wildest parts of the interior, but approached with difficulty by the hunter, and of little value to the inhabitants. It is not there known as a domestic animal. The reindeer attains its greatest size in the arctic regions; and in western Europe it is not found very far to the s. of the arctic circle; but in Siberia and in America its range extends much further to the s., almost to the latitude of Quebec in America; and in the w. of Asia along the whole chain of the Ural mountains, and even to the s. of Astrakhan, almost to the Caucasus.

The wild reindeer of Lapland is almost equal in size to the stag, but there are great differences of size in different districts, the largest size being generally attained in very polar regions. The domesticated reindeer is never so large as the largest wild ones; but the domesticated reindeer of Siberia is, like the wild one, much larger than that of Lapland. The reindeer is very inferior in gracefulness to the stag, and indeed to most species of deer, being of a rather heavy appearance, with comparatively short and stout limbs, the withers much elevated as in the elk, and the neck carried almost straight forward. The tail is very short. There is little or no mane, but the hair of the lower parts of the neck is very long and shaggy. Both sexes have large horns, those of the male being larger and often more than 4 ft. long. They are slender and cylindrical almost to the tip in young animals, but in old ones become palmated there, although still slender and cylindrical at the base; they are more or less branched, and from the base spring one or two branches, comparatively short, but also in old animals much palmated, so that the armature of the head is of a very peculiar appearance. The reindeer is said to use its horns to remove the snow from the lichens which form great part of its winter food; it also scrapes up the snow with its feet and turns it up with its snout; and by a beautiful provision of nature the feet, forehead, and nose are protected by a remarkably hard skin. The reindeer is gregarious, partially migratory—its migrations, however, not

being regulated by climate, but by the facility of obtaining food. To the Laplander the reindeer constitutes the chief part of his wealth; and many Laplanders possess herds of 2,000 and upward, which they feed chiefly in the mountainous tracts in summer, and in the lower grounds in winter. The flesh is excellent, as is also the milk, which is much used. The skins are used for clothing, tents, and bedding. The hard skin of the face and feet is much valued by the Laplanders for making shoes. The reindeer is also extremely valuable as a beast of draught, for which purpose it is harnessed to sledges. It is capable of maintaining a speed of 9 or 10 m. an hour for a long time, and can easily draw a weight of almost 200 lbs. besides the sledge. It is much employed for this purpose in Siberia as well as in Lapland; but in America it is merely an object of chase, valued for its flesh, fat, and hide. Among other methods resorted to by the Esquimaux and other Indians for its capture is that of making pits in the snow, covered with a slab of ice, which revolves on its own center when the reindeer sets foot on it. The flesh and fat are made into pemmican (q.v.), besides being used in a fresh state. A very thick layer of fat lies under the skin of the back of the male. The American reindeer is called the CARIBOU, and is sometimes regarded as a distinct variety, but the differences are very slight. Although the reindeer has been found to live for years when brought to Britain, the climate does not seem suitable to it.

The reindeer suffers grievously during summer from the attacks of various kinds of insects, and particularly of a species of bot (q.v.), which is sometimes not merely tormenting but destructive.

REINDEER MOSS, *Cenomyce rangiferina* or *Cladonia rangiferina*, a lichen of great importance to the Laplanders and other inhabitants of the northernmost regions of Europe and Asia, as forming the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in the arctic regions. It is common in Britain, growing in moors and on mountains. It covers extensive tracts in Lapland and other very northern countries, making them even in summer as white as snow, and often thus occupies the ground in pine forests. When pine forests are destroyed by fire it soon springs up in its greatest luxuriance. It is a very variable plant, but always consists of a much-branched erect cylindrical tubular thallus, with small perforations in the axils. It attains a height of 2 in. and upward. The branches of plants which grow together usually mix very intricately into one mass. The importance of this lichen was first brought into notice by Linnaeus in a beautiful passage of his *Flora Lapponica*. The reindeer reach it by scraping with their feet, even when it is covered with very deep snow. It is capable of being used for human food, and was recommended for this purpose in times of dearth by an edict of Gustavus III. of Sweden. Its taste is pleasant, although attended with a slight pungency or acridity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on the lichenin (q.v.) which it contains.

REINFORCE, FIRST and SECOND, in guns, are the two sections of the length which come next the breech. The gun is made thicker at these parts, so as to resist more effectually the explosive action of the powder. The thickness of metal is less at the second reinforce than at the first, the powder being considered to have already exerted its greatest disruptive force. This conclusion is, however, open to dispute.

REINKENS, JOSEPH HUBERT, b. at Burtscheid, near Aix-la-Chapelle, in 1821; studied theology at Bonn; ordained priest of the Roman Catholic church; was cathedral preacher 1852-53, and in 1857 appointed professor at Breslau. In 1870 he united with Döllinger in the Old Catholic movement; was suspended by the bishop of Breslau, and the students were forbidden to attend his lectures. In 1873 he was consecrated bishop at Rotterdam by the Jansenist bishop of Deventer. He soon took the oath of allegiance to the government, and was recognized by the emperor as a Catholic bishop. He has published several theological and philosophical works.

REIS EFFENDI, a title formerly given to an officer of state in the Ottoman empire. He was the chancellor of the empire, and minister of foreign affairs. His duty in the first-mentioned capacity was to confer with the grand vizier regarding the orders and instructions to be sent to the different provinces, and regarding the proper decision on any subject affecting the empire, whether internal or external; and in the latter capacity he had the sole and exclusive charge of the relations of the Porte with foreign courts.

REIS'SIGER, KARL GOTTLIEB, 1798-1859; b. Wittenberg, Germany; educated at Leipsic, and studied music at Vienna, Munich, and other cities. The greater part of his life was spent at Dresden, where he was first director of music, and later chapel master. He published a melodrama and several operas, but is best known by his oratorio *David*, and by his songs.

REJOINER, in English law, means the pleading of a defendant in answer to a plaintiff's replication. The order of pleading is declaration, plea, replication, rejoinder, surrejoinder, rebutter, surrebutter, etc., each party alternately delivering one of these pleadings.

RELAPSING FEVER is one of the three great species of continued fever common in Great Britain, the two others being typhus and typhoid. Although the disease has been accurately described by several physicians during the last century (since 1739), its present

name was given to it only about 1850 by Dr. Jenner. It had previously been vaguely known under the various names of *five-day fever*, *seven-day fever*, *mild yellow fever*, *short fever*, *short relapsing fever*, etc., and has often been confounded with common continued fever. It has attracted special notice since 1843-44, when there was prevalent in Scotland "an epidemic fever characterized by the suddenness of its onset, its wide diffusion, its short duration, and its small mortality; by its proneness to relapses, by the frequent occurrence of petechiæ, of something like black vomit, and of yellowness of the skin; by the absence of intestinal ulcers; and by profuse sweatings, whereby the fever seemed to be solved." This fever was supposed at the time by Alison and other eminent physicians who described it, to have been a new and hitherto unknown pestilence; but Jenner's subsequent researches showed, as has been already mentioned, that in this respect they were in error, epidemics of this kind having previously occurred in Scotland or Ireland (or both simultaneously) in 1736, 1739-41, 1800-01, and 1816-20.

Relapsing fever usually begins suddenly with rigors, a sense of chilliness and frontal headache. Febrile reaction soon sets in; the tongue is coated with a thick moist whitish fur; and the skin is often so yellow as to approach to jaundice (a phenomenon that never occurs in typhus or typhoid fever). By the fifth or sixth day there is usually delirium. After the above-described symptoms have lasted for a period varying from five to eight days, generally on the seventh day, a sudden change takes place. This change commences with a copious perspiration, which is followed by a rapid falling of the pulse to its healthy rate (or even lower), and the patient appears nearly well. But from the fifth to the eighth day of this seeming convalescence a sudden relapse occurs, and all the primary symptoms return; these run a rather shorter course than before, and again terminate in sweating and in a second convalescence, which is in most cases permanent. The relapse sometimes, however, occurs three or even four times.

Death is a rare termination of relapsing fever, and when it does occur it is usually before the seventh day of the disease. No special anatomical lesion is observed in the bodies of those who succumb to this disease, but enlargement of the spleen is by no means uncommon.

The treatment to be adopted is simple. The bowels should be opened at the commencement of the attack by calomel and rhubarb, and, if necessary, kept open subsequently with castor oil or saline aperients. The headache must be encountered by leeches or cupping if the patient is robust, and by blisters or dry cupping if he cannot bear the loss of blood. The vomiting is often hard to check: if effervescent draughts fail, it may sometimes be combated by calomel and opium combined in pills.

Its cause is unknown, but it mainly attacks the poor and the ill-housed and ill-fed. Its poison appears to be a specific kind; the phenomena of the fever are very different from those of typhus and typhoid fevers; and persons recovering from these diseases may catch, by contagion, this disease, while patients convalescent from this fever may take typhus or typhoid fever. It has been supposed by some physicians to be allied to yellow fever, but it seems more nearly to resemble some form of remittent fever (q.v.), on account of the repetition of the rigors after a regular daily period of from two or three days.

RELATIVE KEYS, in music, the keys most nearly related to any key whose scales have the greater number of their notes in common with it. The keys which are most nearly related to a major key, taken as principal, and into which it may most easily pass, are its *dominant*, or fifth above; its *subdominant*, or fifth below—each of which differs from it by only one sharp or one flat—and its *relative minor* key; that is, the key which has the same signature, is in its descending scale the same, the ascending scale differing by two notes. In the same way, the keys most nearly related to a minor key are its *dominant* and *subdominant* and its *relative major*. Thus the relative keys of C major, as principal key, are G major, F major, and A minor; and the relative keys of A minor are E minor, D minor, and C major. A more remote degree of relationship subsists between a major key and the dominant and subdominant of its relative minor, or between a minor key and the dominant and subdominant of its relative major. A major key is also closely connected with its tonic minor, or the minor key of the same tonic, as the two keys have the tonic, dominant, and subdominant in common.

RELATIVE PRONOUNS differ from personal and other pronouns (q.v.) in this, that, besides standing for nouns, they at the same time have the power of conjunctions. They join sentences or clauses by *relating*, or referring back directly, to something just named. The relatives in English are *who*, *which*, and *that*. *What* is used for *that which*, thus embracing both relative and antecedent. In many cases *who* or *which* can be resolved into a conjunction and a personal pronoun. Ex. "At last the surgeon was called in, *who* (=and he) straightway amputated the limb." "Why consult Charles, *who* (=for or since he) knows nothing of the matter?" "Ahab seized the vineyard of Naboth, *which* (= although—it) he had no title to." In cases where they are not thus resolvable, they introduce sentences or clauses to limit nouns, the relative clause serving the purpose of an adjective. Ex. "He picked out all the men *who had blue eyes*" (= the blue-eyed). "The house *which stands* (= situated) half-way up the hill is the most cheerful."

Who is employed when the reference is to persons, and *which* when it is to inferior animals or things. *That* is applied to both persons and things; but it does not follow

that it may be used at pleasure instead of *who* or *which*. Whenever a *who* or *which* is resolvable as above described, the substitution of *that* would alter the meaning; in the last, e.g., of the three examples given, it would make the sentence declare that Ahab seized the particular one of Naboth's vineyards to which he had not a title; implying that he had a title to some other vineyard or vineyards of Naboth. It is only when the purpose of the relative clause is to limit or define the thing meant that *that* is ever applied; and for this purpose its use is in general preferable to that of *who* or *which*. It is easier and more idiomatic to say, "All the men that had blue eyes," than "All the men *who*," etc.; and who would think of saying, "This is the house *which* Jack built"? Besides, *that* so employed often avoids ambiguities that would attend *who* or *which*. Ex. "His conduct surprised his English friends, *who* had not known him long." This may mean either that his English friends generally were surprised, for the reason that they had not known him long; or that only a portion of them—those, namely, that had not known him long—were offended. If the latter is the meaning intended, it would remove all ambiguity to write, "His English friends *that* had not known him long."

The use of the demonstrative *that* as a relative is common to the Teutonic languages, but is unknown in Greek and Latin and in the Romanic languages. The relatives proper (and the many derivatives and compounds formed from them) in all the allied languages begin with *k* or an equivalent of *k* (*qr*, *hr*, *hu*=*wh*, *w*, *h*). Sans. *kas*, Gr. *kōs* or *pōs* (how). Lat. *quis*, *qui*, Pol. *kto*, Goth. *hvas*, Ger. *wer*, Dan. *hvi* (pron. *vi*), Eng. *who*, *how*, Fr. *qui*, It. *chi*.

The relatives proper are also used (sometimes with a slight variation of form) to ask questions, when they are called interrogatives.

RELATIVE RANK, in the army and navy, signifies the precedence which certain non-combatant officers and others are entitled to take among their combatant brethren; for instance, a controller has the relative rank of maj.gen., a naval surgeon that of a naval lieutenant, etc. Relative rank carries with it all precedence and advantages attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants, rations of fuel and light (or allowances in their stead), detention, and prize-money. Relative rank does not entitle the holder to salutes from ships or fortresses, nor to the turning out of guards, and, of course, it does not confer any right to command.

The relative rank of the several civil departments is stated under their respective headings; see MEDICAL DEPARTMENT, PURVEYORS, etc. It only remains to show the relative rank of the army and navy:

<i>Navy.</i>	<i>Army.</i>
Admiral of the fleet.....	Field marshal.*
Admirals.....	Generals.*
Vice-admirals.....	Lieutenant-generals.*
Rear admirals.....	Major-generals.*
Captains of the fleet,	Brigadier-generals.*
Commodores, 1st and 2d class }	
Captains over three years' service.....	Colonels.*
Captains under three years' service.....	Lieutenant-colonels.*
Commanders.....	Lieutenant-colonels.†
Lieutenants of 8 years' standing.....	Majors.*
Lieutenants under 8 years' standing.....	Captains.*
Sub-lieutenants.....	Lieutenants.*
Midshipmen.....	Sub-lieutenants.*

RELATIVE RANK (*ante*). In the U. S. army and navy the relative rank of officers is as follows:

<i>Army.</i>	<i>Navy.</i>
Second-lieutenant.....	Ensign.
First-lieutenant.....	Master.
Captain.....	Lieutenant.
Major.....	Lieutenant-commander.
Lieutenant-colonel.....	Commander.
Colonel.....	Captain.
Brigadier-general.....	Commodore
Major-general.....	Rear-admiral.
Lieutenant-general.....	Vice-admiral.
General.....	Admiral.

The officers in the marine corps rank with those bearing the same titles in the army.

RELEASE, in English law, is a discharge of some interest in land, or of some legal right. Thus, where one who is the owner of land gives or transfers his right to another who has some prior estate in possession, the deed by which this is done is a release

* According to date of commission

† Junior of the rank.

Formerly it was usual for A to give a lease of land to B, and next day to give a release conveying the rest of the estate to B. The term "release" is also used as a discharge of all demands or rights of action in reference to a particular matter.

RELEASE (*ante*) may be express or implied, as it is made in direct form or arises from an act of the creditor or owner. When the releasor performs some act which the law presumes to be a release to other parties, it is called a release by operation of the law. In making a general release the words "claims or demands" are usually employed. But even when general words are used, the court will often limit their application in accordance with the circumstances giving rise to the release. Where a witness is rendered incompetent to testify by a personal interest in the property in dispute, a release from the proper party will make him competent. In real-estate law the terms used in a release are usually "remised, released, and forever quit-claimed." Five kinds of releases in real-estate law are given: those which pass the estate, those which pass the right, as from a disseizee to a disseizor; those which release by enlargement, as where a landlord gives his reversionary interest to a tenant in possession; release by way of extinguishment, as of an easement; and release by feoffment and entry, where one of two disseizors obtains a release from the disseizee and thereby gains the estate in fee to the exclusion of the other.

RELEVANCY, in Scotch law, means the condition of a plea which is well founded in point of law, provided it be true in fact. An objection to the relevancy corresponds in many respects to a demurrer in English.

RELICS (Gr. *leipsana*, Lat. *reliquiae*, remains), the name given in theological and historical nomenclature to what may be in general described as the personal memorials of those among the dead who have been distinguished during life by eminent qualities, especially by sanctity or by remarkable religious services. Under the same name are classed certain objects which are believed to be memorials of the life of our Lord upon earth, and especially of his passion and death. Such memorials of the distinguished dead have at all times and in all states of society, however rude, been held in honor among men. But the question as to relics is chiefly important in relation to Christian history, in which the name is restricted to a single class of memorials, viz., to objects which derive their value from their connection with our Lord and with the saints; as, for example, fragments of our Lord's cross or crown of thorns, portions of the dust, the bones, the blood, the instruments of torture, the chains, etc., of the martyrs, the mortal remains, the clothes, the books, and other objects of personal use of the other saints, and even objects to which a certain indirect sacred interest is given by their being brought into contact with the direct memorials of the distinguished dead, as by their being placed on the tombs of the martyrs, touched with the relics, or blessed at the shrine or sanctuary of the saints, etc. In all such cases the motive of religious honor, however differently it arises, is precisely the same, viz., the association of the object which is honored with the personage whose virtues or services are the subject of grateful veneration. The merits of relics, in their theological aspect, are beyond the scope of this publication. We shall confine ourselves to an outline of the history of the veneration of relics, and to an explanation of the conflicting views of the rival Christian communions on the subject.

The very earliest monuments of Christian history contain evidences of the deep and reverential affection with which martyrs of the faith, their mortal remains, and everything connected with their martyrdom, were regarded by their fellow-Christians, and for which Catholics profess to find warrant in many passages of the Old and of the New Testament, as Ex. xiii. 19; Deut. xxxiv. 6; 2 Kings xiii. 21, and xxiii. 16-18; Isaiah xi. 10; Matt. ix. 20-22; Acts v. 12-16, and xix. 11, 12. The contemporary letter of the church of Smyrna attests this plainly as to the martyrdom of Polycarp; Pontian's *Life of Cyprian* tells of their stealing the martyr's body, and carrying it away by night in holy triumph with lights and torches. At an early period, too, miracles are described as connected with relics. Thus Ambrose (Ep. xxii. 1, 2) tells of a blind man's sight restored by his touching the bodies of the martyrs Gervasius and Protasius; and similar wonders are detailed by Gregory Nazianzen (*Orat. xviii.*), Chrysostom (*In S. Ignatium*, n. 5), Leo the great (*Serm. iv. 4*); inasmuch that the possession of relics of the martyrs, and even the occasional touching of them, was regarded as a special happiness (Gregory Naz. *Orat. in S. Theodorum*), and that not merely individuals, but, according to Theodoret the historian, even cities were content to share with each other portions of the sacred treasure (Theodoret, *Græc. Affectionum Curatio*, disp. viii.). Connected with this feeling, too, is found a belief of a certain sacred efficacy in the presence or the touch of the relics, and especially there is ascribed by Chrysostom, Basil, Theodoret, and other fathers, to prayers offered before the relics, a virtue in dispelling or warding off sickness, diabolical machinations, and other evils. Hence we find that altars were erected over the tombs of the martyrs, or at least that relics were invariably placed on the altars, wherever erected, inasmuch that the Trullan council ordered the demolition of all altars in which no relics had been deposited. Far more sacred than the relics of martyrs was the cross of our Lord, which was believed to have been discovered at Jerusalem by Helena (a. v.), mother of the emperor Constantine. Minute portions of the wood were

distributed to the principal churches; and Cyril of Jerusalem, within less than a century after the discovery of the cross, describes the precious wood as dispersed throughout the world. It must be added, too, that even at this early period, many abuses and superstitions had crept in, which even the fathers who admit the worship do not fail to condemn.

The practice of relic-worship, however, and the feeling on which it was founded, were not suffered to pass without a protest. Vigilantius, in a treatise which is now lost, but the tenor of which is learned from his adversary, Jerome, reprobated in the strongest terms the excesses to which it was carried, and indeed the essential principles on which the practice rests. But the protest fell without drawing an echo from the contemporary mind. Vigilantius had so few followers, that were it not for the refutation of his work against relics composed by Jerome, we should have no record of his opposition to the popular view; and it is urged by Catholics, as a proof of the universal acquiescence of the church of the 4th c. in the practice of relic-worship, that in an age remarkable for intellectual activity and for polemical ardor—an age which in 25 years saw nearly 30 councils in the cause of the Pelagian heresy—it was not even found necessary to call a single council to condemn Vigilantius.

The writings of Augustine, of Paulinus of Nola, of Ephrem the Syrian, of Gregory the great, and others, are full of examples of the miraculous virtue ascribed to relics, and of the variety and the extensive multiplication of sacred memorials of all kinds. Nor was this confined to the orthodox alone; all the different parties in the controversy on the incarnation agreed with Catholics and with one another on this subject, and even the Iconoclasts, at the very time that they most fiercely repudiated the use of images, admitted without difficulty the veneration of relics.

In the age of the crusades a fresh impulse was given to the worship of relics in the west by the novelty and variety of the sacred objects brought home from the churches of Syria, Asia Minor, and Constantinople by crusaders, by palmers returning from Palestine, and by the Latin conquerors of Constantinople; and it is admitted by the most zealous Catholics that at this period many false, and perhaps even absurd and ridiculous relics were introduced, and were successfully commended to the veneration of individuals or individual churches in the west; nor do they venture to doubt that abuse and superstition found their way side by side with what they regard as the genuine and authorized worship of the church. Nevertheless, with the exception of the Waldenses, Wycliffe, and a few isolated individuals, the practice remained unchallenged till the 16th c., when, in common with many other doctrines and practices of the church of Rome, it was utterly repudiated by the reformers. Catholics, however, allege that the practice, as sanctioned by the church, has nothing in common with the abuses which form the main ground of the objections alleged by Protestants. The Roman Catholic use of relics, as authorized by the church, is to serve as incentives to faith and piety, by recalling vividly to men's minds the lives, and, as it were, the corporeal presence and the earthly converse of the saints, and thus placing before them, in a more touching manner, the virtues which, in the examples, are held up for men's imitation. The decree of the council of Trent connects the subject of relic-worship with the general question of saint-worship, and regards the relics of the saints not as possessing intrinsic virtue, but only as instruments "through which God bestows benefits on men." See INVOCATION OF SAINTS.

The Greek and other oriental churches, and most of the oriental sects, agree with Roman Catholics in the practice of relic-worship. On the contrary, the reformed churches, without exception, have rejected the usage as unscriptural, calculated to withdraw from the worship of the one God, and deformed by numerous superstitions. They regard a large proportion of the relics which Roman Catholics worship as false and supposititious, and they specify several, regarding the spuriousness of which even learned Catholics appear to be satisfied. Some relics have been the subject of much controversy among Roman Catholics themselves. See HOLY COAT, HOLY PLACES, LORETTO, PILGRIM. It may be added that the practice of relic-worship forms a notable feature of the Mohammedan usage of pilgrimages. The holy cities of Mecca and Medina, and the celebrated mosque of Omar at Jerusalem, owe most of their holiness in Mohammedan eyes to the memorials of the prophet, and other relics which they contain; and the celebrated *sanjak-sherif* or sacred standard at Constantinople, is believed to be formed of the nether garment of Mohammed. The practice occupies a still more important place in Buddhism (q. v.—see also CEYLON).

RELIEF, in English law, means a payment by a tenant or vassal to a lord, the theory being, according to feudal law, that relief (*relevium*, Lat. *relevare*) is a restoration of the lands after the wardship or guardianship of the lord has ceased, and the vassal has attained majority.—Relief is also the common term used among the poor and among parochial officers to denote the pecuniary assistance given under the poor-laws to a pauper. See RELIEVING OFFICER.

RELIEVING OFFICER is a person appointed in an English union or large parish to administer relief, or rather to inquire into the title of destitute persons to be relieved by such union or parish. He is appointed by the board of guardians, and his duty is to receive all applications for relief, to inquire into the truth of the facts alleged by the

paupers as to their place of settlement, their state of health, ability to work, and the state of their family. In discharging this duty, he requires to visit the house where the pauper lives, to relieve cases of urgent necessity, etc., and to keep a list of all these paupers, and enter what is done with them in his book.

RELIEVO. See ALTO-RELIEVO.

RELIGION, in Christian countries, is generally understood as the feeling of reverence toward the Creator and Ruler of the world, together with all those acts of worship and service to which that feeling leads. The root of this sentiment lies in the very constitution of man, and in the circumstances in which he is placed, and manifests itself abundantly even where the one supreme God of the Christian is unknown. Man is naturally religious, and if he is ignorant of the true God, he must make to himself false ones. He is surrounded by dangers and difficulties; he sees the mighty powers of nature at work all around, pregnant to him with hope and fear, and yet inscrutable in their working, and beyond his control. Hence arises the feeling of *dependence* upon something more powerful than himself—the very germ of religion. These operations of nature, again, he has only one way of conceiving and accounting for. The idea of physical causes is one of late growth; to the primitive man, there is only one kind of agency he can understand—that of a will or mind like his own. Hence all things that he sees moving and acting become to him animated, conscious beings, with thoughts and passions similar to those of men; and what more natural than that he should seek, by offerings and entreaties, to secure their favor, or propitiate their malignity or anger. There is no doubt a vast distance between the reverence with which the Christian looks up to Him that fills the universe, and that of the poor fetich-worshippers (see FETICHISM), but in both cases it is the same feeling that is at the bottom—they are both manifesting religion.*

According to this view, religion includes all forms of belief in the unseen and spiritual powers or gods, together with the practices arising out of those beliefs. The forms that religious belief has assumed are endless, but they may be all classed under two heads: *Monothicism*, or the belief in *one* God; and *Polytheism*, or the belief in *many* gods. The several modes of religious belief and worship are treated in this work each under its own name. See JEWS; CHRISTIANITY; ENGLAND, CHURCH OF; ROMAN CATHOLIC CHURCH; PRESBYTERIANISM; FRIENDS; GREEK RELIGION; MOHAMMEDANISM; INDIA, RELIGION; BUDDHISM; LAMAISM, etc. Subjoined is a statistical table of the divisions of mankind in this respect.

* The word *religion* is of Latin origin, and according to its etymology would mean "binding," "obligation," or rather "restraint." It was applied by the Romans to all actions in which men are guided, not by motives deducible from the ordinary course of nature, but by regard to some unseen power or mysterious influence; as when Livy says of a spot in the forum: *ubi desunt religio est*, "where spitting is a matter of religion;" i. e., where there is a religious scruple restraining people from spitting.

SUMMARY.

The religions of the world, from the above tables, may be shortly summarized in round numbers as follow:

1. Jews.....	8,000,000
2. Christians.....	371,000,000
3. Mohammedans.....	103,500,000
4. Hindus.....	129,500,000
5. Buddhists.....	483,000,000
6. To which may be added the Fetichism of the aboriginal tribes of Africa, America, etc.....	189,000,000
Total.....	1,294,000,000

—which, according to statistical writers, is the present population of the globe.

As illustrative of the sects into which the Protestant world is divided, it may be stated that in Great Britain there are no less than 146 religious denominations. The following table, drawn up from reliable data, shows the numerical strength of the principal churches and divisions of the Protestant part of Christendom, with which they are principally connected:

Lutherans.....	33,767,924	Brethren.....	108,422
Anglican church.....	14,459,000	Mormons.....	100,902
Calvinists.....	13,716,958	Swedenborgians.....	12,000
Presbyterians.....	3,866,000	Evangelical Union.....	10,319
Baptists.....	2,439,436	Irvingites.....	6,000
Methodists.....	4,406,422	Christian Disciples.....	2,471
Congregationalists.....	1,445,683	Sandemanians.....	1,700
Universalists.....	656,000	Campbellites.....	710
Quakers.....	203,091	Free Christian Brethren.....	340
Unitarians.....	183,000	Christian Chartists.....	220
Moravians.....	157,925		

RELIGION, OFFENSES AGAINST. See **BRAWLING IN CHURCHES.** In Scotland the crime of blasphemy is sometimes described as the crime of treason or lese-majesty against God, which consists in denying his being and attributes, and uttering impious and profane things against God, or the authority of the holy Scriptures. The crime was more rigorously punished by the old statutes of Scotland than by those of England; but the statute 6 Geo. IV. c. 47 declared it expedient that the punishment should be the same, and enacted accordingly. Profanity is in Scotland treated as an offense lower in degree than blasphemy, and includes profane swearing, which is punishable with a fine by justices of the peace; scotting at religion, or the public mocking or contempt of religion, which is punishable in the same manner, and the disturbance of public worship. The first statute providing against disturbances of public worship was dated 1551, which inflicted a fine; but a later statute of 1587 added escheat of movables as part of the punishment, and applied the penalty to all cases of raising a fray or disturbance in the kirk-yard equally as in the kirk, to the troubling or dispersing of the people assembled there for religious purposes.

RELIGIOUS AMENDMENT TO THE CONSTITUTION, the proposed insertion in the constitution of the United States of an acknowledgment of God, the Scriptures, and Christ. The reasons advanced by its advocates are: 1. The nation must proceed from a power higher than itself. Having supreme jurisdiction over a portion of the earth, it acknowledges no superior unless it be God. As, therefore, it must be in subjection to the supreme governor, the fact ought to be acknowledged in the constitution. 2. The United States are a Christian nation. The first settlers acknowledged God, the Bible, and Christ. Christianity pervades our institutions, is the preservative element and inspiring soul of the national life. It should, therefore, be recognized in the constitution. 3. The present condition of the country requires the amendment to be made. Large numbers of persons holding secular, infidel, and socialistic theories of government have made it their home, and are diffusing their sentiments; education is discussed more earnestly than ever before, and many are seeking to separate from it all religious principles and restraints. Such facts require that the religious institutions of the land should have a guaranty in the constitution. The reasons offered against the amendment are: 1. The quality of the acts of a state depends on their true nature, and not their outward appearance; on what the state really is, and not what it professes to be. If the people of a country act as Christians, no formal profession of being so is necessary; if they do not act so, no formal profession can be of any avail. 2. Christianity first made known to the world the true idea of religion. In settling the functions of the church it declared also those of the state; it determined their respective limits, within which each might act without collision with the other. The church and the state correlate each other, each fulfilling its proper ends. The state gives the church protection, security, and liberty; the church influences the state, forming the character of citizens, and elevating, enlarging, and purifying the laws. All this can be done without making any alteration in the constitution. 3. The advocates of the amendment confess that hitherto it has been a fact that Christianity is an element of the common law of the land. As this has been the fact under the constitution as it is, it may continue to be the fact without the constitution being changed. 4. There are in the constitution implied acknowledgments of God, in the oaths which it requires to be administered; of the Scriptures, in recognizing Sunday as a day of rest from avocations required on other days; of religion, in forbidding any law to be made establishing it or prohibiting the free exercise thereof; and of Christ, in using, concerning him, the expression "our Lord." Without deciding the question, which may finally depend on considerations not above adduced on either side, it is open to remark that not all the above arguments against the proposed amendment seem valid; some proving too much, and others inapplicable to the case. The movement for amendment, however, does not seem to be gaining strength.

RELIGIOUS ORDERS. See **MONACHISM, ante.**

RELIGIOUS TRACT SOCIETY, a society for the promotion of religion by the publication and circulation of religious tracts and small books. By far the most important religious tract society in the world is that of London, which was founded in 1799.

There are now, indeed, numerous religious tract societies in different parts of the world, comparatively limited in their field of operations; this great society reckoning many of them as its branches and auxiliaries. The advantage likely to accrue to the cause of religious truth by the diffusion of tracts and pamphlets was thoroughly appreciated at the time of the reformation, but no society was formed for the purpose. In the 17th c. several tracts are found of associations for printing and promoting the sale of religious works, but none of them seems to have existed long, or to have been intended for permanence. The English "society for promoting Christian knowledge," founded in 1701; avowed, for one of its objects, "to disperse, both at home and abroad, Bibles and tracts of religion." In 1750 a society was formed in England called "The Society for Promoting Religious Knowledge among the Poor." not, like the former, confined to the church of England, but embracing Christians of all denominations, which published many tracts and books; and shortly after similar societies were founded in Edinburgh and Glasgow, which, however, were of brief existence. The design of the religious tract society originated with Mr. Burder, a minister at Coventry, and amongst its founders were Rowland Hill, Matthew Wilks, and other ministers eminent in their day. It was founded on occasion of the annual meeting of the London missionary society. Its beginnings were humble, but it soon expanded, until its income, from contributions of benevolence, has for many years been always above £4,000, sometimes nearly twice that sum. It derives also a large income from the sale of its publications. Its operations have extended over all quarters of the world, and it has issued books and tracts in more than 100 different languages and dialects, thus rendering very efficient assistance to missionary and other evangelistic operations. Many of the publications of the society, except during the first years of its existence, have been books rather than tracts. It has produced many new works, and also many reprints and abridgments.

Objections are sometimes strongly urged against its mode of operations, as interfering with the natural course of the book-trade and checking free commercial enterprise; to which it has been always replied that the diffusion of good and cheap books has increased the demand for them, and that the influence of the society has been favorable and not unfavorable to the book-trade in general. It is impossible, however, to accept this as any proper answer to the objections in question. Fair competition in trade is a sacred principle not lightly to be interfered with, and it is sufficient to say that certain members of the general publishing business complain of being encountered by a system of production which leaves them no hope of competing successfully with the society. That tracts distinctly religious may be rendered a valuable engine of spiritual and social advancement is not to be disputed; and those impressed with this conviction cannot but regret that among the immense mass of tracts issued in Great Britain and the United States not a few, owing to the exaggerated and mistaken views they present not only of the facts of life but of the teaching of Scripture, are perhaps more calculated to damage than promote the cause they are meant to serve.

RELIQUARY, a case or box to contain relics. They are made of all kinds of materials, such as wood, iron, stone, ivory, silver, etc., and are frequently ornamented with costly jewels. Shrines are of the same description. That of the "three kings," at Cologne, has jewels valued at £240,000.

REMAINDER is a term much used in the law of England. Thus, if the owner of the fee-simple or freehold of lands give them by will or deed to A for life, and after his decease to B and his heirs, the interest of B is called the remainder, because, after deducting A's life-estate, all that remains belongs to B. A remainder is distinguished from a reversion in this, that in the latter case the remainder returns to the owner of the estate himself, and so it is called, in that instance, a reversion instead of a remainder. A contingent remainder is too technical a term to be popularly explained, though it plays an important part in the law of real property in England. It is an estate which may or may not ever become vested or enjoyable.

REMBANG, a residency of Java, has an area of 2,650 sq. m., and (Dec. 31, 1873) a pop. of 925,508, including 665 Europeans and 15,402 Chinese. There are extensive forests, containing fine timber, the haunts of wild cattle, swine, and three species of tiger. The products are chiefly cocoa-nuts, coffee, sugar, tobacco, and cotton. Boat-building, fishing, weaving, making earthenware and paper, gold and silver work, are occupations.—Rembang, the capital, is a sea-port. Pop. 12,000. There is a government school, an institute for girls, and a Protestant church.

REMBRANDT HERMANSZOOM, commonly called **REMBRANDT VAN RHYN**, was the son of a miller, Herman Gerritsz van Rhyn, whose house (where the painter was born) and mill were situated on an arm of the Rhine at Leyden. Rembrandt Hermanszoon was born either on July 15, 1606, or in 1608. The former date rests on the authority of the *Description of Leyden*, published in 1641, by Orlers, burgomaster of that town, under whose custody, along with other registers of the city, were those of the registers of baptism, since lost. The latter date rests on the painter's marriage-certificate, lately discovered, dated June 10, 1634, in which Rembrandt Hermanszoon is stated to be aged 26, and thus the year of his birth 1608. He attended for a short time the Latin school at Leyden; and after studying art three years under Jacob van Swanenburg, and for a very limited period under Pieter Lastman at Amsterdam, and Jacob Pinas at Haarlem,

he returned home, and devoted himself to the study of nature. His works now attracted some attention; and about the year 1630 he was encouraged to establish himself at Amsterdam, where he soon entered on a most successful career, and executed numerous works—portraits, landscapes, historical and *genre* subjects, and those wondrous etchings, numbering above 360, which have served almost as much as his paintings to raise his reputation so high. Rembrandt Hermanszoon holds the chief place in the Dutch school; his power and originality are exemplified in almost every branch of art; and as examples of composition, expression, color, and light and shade, his works rank with those of the greatest artists. He had numerous pupils, many of whom, such as Gerard Dow, G. Flinck, F. Bol, N. Maas, P. de Koning, and Vanden Eeckhout, were distinguished artists. Rembrandt Hermanszoon spent his large gains in the indulgence of a taste for works of art, arms, and objects of *vertù*, as is proved by an inventory of his effects, extracted from the registers of the insolvents' court at Amsterdam, for he got into difficulties, partly from his expensive habits, and partly on account of claims by the tutors of his son, after the death of his first wife. He married a second time, and left two children; his son Titus, by his first wife, predeceased him. Many interesting matters connected with the history of this great painter have been brought to light, and published so lately as 1853, by Dr. P. Scheltema, keeper of records at Amsterdam. The date of the painter's decease was a matter of doubt; but among other documents discovered by this author, the following extract, from the register of burials of the city of Amsterdam, proves that he was interred in the Westerkerk (west church) on Oct. 8, 1669: "Deynsdach, Oct. 8, 1669, Rembrant van Rijn, Schilder, op de Rosegraacht, teghenover het Doolhof. Laet na 2 Kynders."—"This day, Oct. 8, 1669 [was buried] Rembrandt van Rhyu, painter, on the Rosegraacht [rose-canal], opposite the labyrinth. He leaves two children.")

REMIREMONT, a small t. of France, in the department of Vosges, stands on the left bank of the Moselle, 17 m. s.e. of Epinal. Here, two abbeys, founded in 620, were destroyed in the 10th c., but afterward rebuilt. Of these, the more important was for lady canonesses. Its abbess was a princess of the empire, and those over whom she presided were all descended from families which had been noble for at least four generations. The remains of the abbey are the finest buildings in the town. In the Mairie is a public library of 8,000 volumes; cotton goods, leather, and iron-ware are manufactured. Remiremont is the great mart for the neighboring mountain districts. Pop. '72, 6,014.

REMISSIO INJURIE, in Scotch law, denotes a forgiveness of an injury, and it is set up in answer to an action of divorce for adultery. Forgiveness implies that the party knew of the injury, and acted as if it had never happened; and it is proved by words or acts, such as cohabitation. In English law, it is called condonation. In Scotch law, remission is an extinguishment of a crime by pardon or by act of parliament, but it does not prevent a private party recovering damages.

REMITTENT FEVER is one of the three varieties of fever arising from malaria or marsh-poison—the two others being intermittent fever, or ague (q.v.), and yellow fever. In its milder forms, it scarcely differs from severe intermittent fever; while in its more serious form, it may approximate closely to yellow fever. As the nature of the poison on which it depends is sufficiently noticed in the article *MIASMA*, we shall at once proceed to describe the most characteristic symptoms. The attack may be either sudden or preceded by languor, chilliness, and a general feeling of *malaria*. Then comes a cold stage, similar to that occurring in ague, and usually of short duration. This is followed by a hot stage, in which the symptoms are commonly far more intense than those exhibited in the worst forms of ague. Giddiness proceeding to delirium is not uncommon, and is a bad symptom; while, in other cases, drowsiness or lethargy is one of the most marked symptoms. There is often great tenderness or pain in the region of the stomach, and vomiting—the vomited matter frequently containing bile or blood. A remission of these symptoms occurs, in mild cases, in six or seven hours; but in severe cases, the paroxysm may continue for 24 hours or longer. The remission is sometimes, but not always, accompanied with sweating. The duration of the remission is as varied as that of the paroxysm, varying from two or three to thirty hours, or even longer. The fever then returns with increased severity, and without any cold stage; and then the paroxysms and remissions proceed, most commonly according to no recognizable law, till the case terminates either fatally or in convalescence. In favorable cases, convalescence is usually established in about a week. The severer forms of this fever are often accompanied with more or less jaundice, and hence the disease has received the name of bilious remittent fever. It is also known as jungle fever, lake fever (from its prevalence on the border of the great American lakes); and the African, Bengal, Levant, Walcheren, and other similar local fevers, are merely synonyms of this disease. In England the disease is very rare; and when it occurs, it is usually mild. The disease is most severe in southern Asia, western Africa, Central America, and the West India islands.

The first object of treatment is to reduce the circulation during the hot stage. This is done by bleeding, followed by a dose of 5 grains each of calomel and James's powder, and, after an interval of three or four hours, by a sharp cathartic—as, for instance, the ordinary black draught. On the morning of the following day, the remission will prob-

ably be more complete, when quinine, either alone or in combination with the purgative mixture, should be freely and repeatedly administered. A mixture of antimonial wine with acetate of potash should also be given every two or three hours, so as to soften the skin and increase the action of the kidneys. Sir Ranald Martin—our highest authority in relation to tropical diseases—has directed attention to the fact, that the patient must be carefully watched during the period of convalescence. A timely removal from all malarious influence, by a change of climate or a sea-voyage, is of the highest importance, and is more likely than any other means to prevent fatal relapses into other forms of fever, or into dysentery, which so frequently occur to our troops at stations where miasmatic influences are rife. Although the above sketch of treatment is applicable in most cases, there are some forms of this fever in which blood-letting cannot be borne; and almost every epidemic fever of this kind requires special modifications of treatment. The following data extracted from a table drawn up by sir Alexander Tulloch, will give some idea of the frequency of this disease and the variations in intensity:

	Period of observation.	Aggregate strength.	Number attacked.	Died.	Ratio of deaths to cases attacked.
Jamaica.....	20 years.	51,567	38,293	5,114	1 to 8
Gibraltar.....	19 "	60,269	1,522	423	1 " $3\frac{1}{2}$

REMONSTRANTS. See ARMINIUS.

REMORA, or SUCKING-FISH, *Echeneis*, a genus of fishes which Cuvier placed among the *discoboli* (q. v.), but which Müller assigns to the order *anacanthi*, and regards as constituting an entire family, *echeneute*. Their chief relation to the *discoboli*, indeed, is in the possession of a sucker, by which to affix themselves to objects of various kinds; but the sucker itself is very different. The remoras have an elongated body, covered with very small scales; one soft-rayed dorsal fin, situated above the anal fin; the head flattened, and covered with an elongated disk extending back beyond it, which is the sucker, the mouth large, with numerous small recurved teeth on both jaws, the vomer, and the tongue. The sucker-disk exhibits numerous transverse cartilaginous laminae directed backward, and has a free flexible broad margin. These laminae are formed by modification of the spinous processes of a first dorsal fin. They are moved simultaneously by sets of muscles raising or depressing them, and when they are raised after the margin of the disk has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus, that great weights may be dragged by a remora; whilst it obstinately refuses to let go its hold, and will even submit to be torn to pieces before it does so. The common remora of the Mediterranean, and of the ancients, is a small fish, seldom more than 8 in. long, of a dusky-brown color. It is found in the Atlantic, and occasionally as far n. as the British coast. It is frequently seen among the other fishes following ships, and often attaches itself by its sucker to some other fish, even of a kind that would make haste to devour it if it could be reached—an instance of which once occurred on the British coast, a remora being taken affixed to a cod—often also to the rudder or bottom of a ship. The ancients imagined that it had power to impede or arrest the course of a ship, a fable which continued to be credited till recent times. Thus, it was alleged, was Antony's ship detained from getting soon enough into action in the memorable and decisive battle of Actium. Of what use its power of adhesion is to the remora, is matter of mere conjecture. The remora is very palatable. There are about ten known species, some of the tropical ones much larger than the common remora. One of them is said, on the authority of Commerson, to be used on the coasts of Mozambique for the curious purpose of catching turtles. A ring is fixed round its tail, with a long cord, and the fish, placed in a vessel of sea-water, is carried out in a boat; the fishermen row gently toward a sleeping turtle, and throw the remora toward it, which seldom fails immediately to affix itself, when the cord is drawn in, and the turtle becomes an easy prey.

REMOTENESS, in law, means that a provision of a will or deed, in favor of some person, does not vest for so long a time that it violates the "rule against perpetuities." This rule requires that an estate shall vest within a life or lives in being, with the addition of 21 years and the period of gestation afterward. The object of the rule is to keep estates from being inalienable. It was taken from the common provision in a marriage settlement, giving a life estate to the parties to the settlement, and the fee to the unborn child or children by the marriage. Such child or children would, upon birth have a remainder in fee, and at the age of 21 could make a conveyance, and join with their parents to convey the whole fee. Under such a provision, alienation could be prevented only for the lives of the parents, and till the child came to majority. The term of 21

years may also be employed absolutely, irrespective of a minority. Any provision exceeding the period of remoteness is void.

REMOULADE, a term in cookery for a fine kind of salad-dressing, consisting of the yolks of two eggs, boiled hard, flour of mustard, about a teaspoonful, rubbed up with three or four tablespoonfuls of oil; when they are thoroughly incorporated, add two tablespoonfuls of vinegar and a little pepper, and other flavoring materials according to taste. It is much used in making the salad called Mayonnaise.

REMOVAL OF GOODS by a tenant of a house to prevent the landlord distraining or seizing them in payment of rent, is attended with this consequence: if the rent is already due, and not merely current rent, then, if a tenant fraudulently or clandestinely remove the goods from the premises, the landlord may, within 30 days thereafter, take and seize these goods wherever they are found, and sell them, by way of payment of his rent. If the tenant remove the goods the day before the rent becomes due, the landlord cannot so follow the goods. Whoever assists the tenant to remove his goods fraudulently, forfeits to the landlord double the value of the goods removed.

REMOVAL OF PAUPERS, in the law of England, is the technical term applied to the compulsory removal of paupers from a parish in which they have become destitute, to the parish or union settlement, and which, therefore, is bound to maintain them. The right of parochial officers to remove paupers in such circumstances has long been considered as one of doubtful wisdom, and the propriety of continuing it has latterly been much discussed. As the law stands, wherever a person becomes destitute in a parish in which he was not born, or in which he has not acquired a settlement (q.v.), as it is called, the overseers may apply to a justice of the peace at once to remove him to his own parish. In such a case, notice must be given by the removing parish to the parish of settlement, so that the latter may oppose the proceeding; and this gives rise to frequent litigation, for the point turns on the antecedent history of the pauper, or it may be of the pauper's father or grandfather. The right of removing paupers is as old as 13 Charles II. At first, it was in the power of the overseers, whenever a poor person came into the parish who was likely to become chargeable, to apply for a warrant to remove him after 40 days. But this was thought too great a restriction on the natural liberty of poor persons to go where they like in the hope of bettering themselves, and the power of removal was restricted to cases where they have already become actually destitute, and apply for relief. Even that limitation was thought to be too oppressive on the poor man; and by a statute of 1846, whenever a poor man had lived in any parish, where he had no settlement previously, for five years, it was not allowed to remove him thereafter at all, but the expense of his maintenance fell upon the common fund of the union. By a later statute of 1865, this period was reduced to one year, and he is now irremovable not only if he has lived one year in a parish not his own, but in any one union; so that now the removability of paupers is greatly checked, and made less oppressive.

REMOVING OF TENANTS, in Scotch law, is the giving up of possession by a tenant after the expiry of his lease or term. There must have been a previous notice to quit, or warning, before a tenant can be compelled to remove, and this notice is 40 days before Whitsunday; i.e., before May 15. If there is no express stipulation in the lease binding the tenant to remove at the end of the lease, then the landlord must give warning, which he does by summons of removing in the sheriff court; and if the tenant do not punctually remove, decree of removal may be obtained. If there is a stipulation to remove, then that is equivalent to a decree of removing, and a sheriff-officer, with a written authority from the landlord, can remove the tenant by force. In England no notice to quit is necessary on either side if the lease was for a definite term; but if it was indefinite, then it is treated as a lease from year to year, and half a year's notice to quit must be given by the landlord. If, however, the tenant wrongfully refuse to quit, there is in most cases no summary mode of ejecting him, and an action of ejectment is necessary.

REMSCHIED, a manufacturing t. of Prussia, occupies a height of 1110 ft. above sea-level, in the government of Düsseldorf, and 18 m. e.s.e. of the city of that name. Originally a villa, it was in possession of a church as early as 1189. It contained several iron foundries in 1580, in which pig-iron was worked into bars by hand. Its iron trade and manufactures were advanced by the immigration of numbers of artisan refugees (q.v.). It carries on extensive manufacture of iron-wares, cutlery, etc., which are exported to all parts of the world. Pop. '71, 22,017; '75, 26,120.

REMUSAT, CHARLES, Comte de, a French philosopher and politician, son of Auguste Laurent comte de Rémusat, a Provençal gentleman of some note, who held various public offices during the first empire and after the restoration, was b. at Paris, Mar. 14, 1797, and studied with brilliant success at the lycée Napoléon. He made his political *début* in 1818 as a doctrinaire journalist, allying himself closely with Guizot, who, he confessed, had exercised a greater influence on the formation of his opinions than any other; but he subsequently withdrew from this connection, and became more independently liberal, though he always remained temperate and prudent in his views. Among his earlier political essays, the most important are *Sur la Responsabilité des Ministères*; *Sur la Liberté de la Presse*; *Sur la Procédure par Jurés en Matière Criminelle* (1820); and *Sur les Amendes*

ments à la Loi des Elections (1820). On the establishment of the *Globe* in 1824, Rémusat became one of its most indefatigable contributors, and his name appears in the list of journalists who signed the protest against the fatal "ordonnances" of the minister Polignac, which brought about the July revolution. After 1830 Rémusat entered the French chambers as deputy of Muret in the Haute-Garonne, representing it till 1848. He supported the ministry of Casimir Périer, was for a brief period under-secretary of state (1836) in that of comte Molé; and in 1840, when the government passed into the hands of Thiers, Rémusat was made minister of the interior, but soon resigned the office. After the flight of Louis Philippe, he continued a member of the constituent and legislative assemblies, and was a warm supporter of the party of order. He was exiled after the *coup d'état* of Louis Napoleon, but subsequently received permission to return to France. He devoted himself to literary and scientific studies, till, in Aug., 1871, M. Thiers called him to hold the portfolio of foreign affairs, which he retained till 1873. He died June 6, 1875. He was long a well-known contributor to the *Revue des Deux Mondes*. Among his writings are his *Essais de Philosophie* (Paris, 2 vols., 1842); *Abelard* (2 vols., 1845); *Passé et Présent* (2 vols., 1847); *Angleterre au XVIIIe. Siècle* (1856); *Bacon* (1858); *Hartley* (1874); *Histoire de la Philosophie Anglaise de Bacon à Locke* (1875), and his philosophical drama, *Abelard* (1877).

RÉMUSAT, CLAIRE ELISABETH JEANNE GRAVION DE VERGENNES, Comtesse de, 1780-1821; b. Paris; grand-niece of Vergennes, prime minister under Louis XVI.; a noted beauty of the court of Napoleon I., an intimate friend of Josephine, a woman of rare moral and intellectual endowments, and author of an *Essai sur l'Éducation des Femmes* (1824), and of the *Mémoires de Madame de Rémusat* (1879). Notwithstanding a life of dignity and honor spent in the heart of the corrupt and vulgar court of Napoleon I., and in which she became a semi-historical figure, she is best known by her posthumous *mémoires*, which expose the baseness of Bonaparte's character by an analytical narrative of his home life. Partisans of the emperor throw doubts on the disinterestedness of her judgment. But the work affords its own evidences.

REMUSAT, JEAN PIERRE ABEL, a distinguished Chinese scholar, was born at Paris, Sept. 5, 1788, studied medicine, and took his diploma in 1813; but as early as 1811 had published an *Essai sur la Langue et la Littérature Chinoises*, the fruit of five years' arduous work. In 1813 the conscription seized him, but, instead of being compelled to serve as a common soldier, he was appointed assistant-surgeon in the Paris military hospitals, and was subsequently intrusted with the charge of fever-patients at the hospital Montaignu. In the midst of his arduous and harassing professional duties, he found time to prepare for the press his *Uranographie Mongole*, and *Dissertation sur la Nature Monosyllabique attribuée communément à la Langue Chinoise*. At last, however, the day came when he was at liberty to devote himself entirely to Sinological studies. The abbé Montesquion, minister of the interior during the first restoration of the Bourbons, instituted a chair of Chinese at the collège de France, and Rémusat was named professor, Nov. 9, 1814. He delivered a splendid inaugural address in Jan., 1815, an analysis of which appeared in the *Moniteur* of Feb. 1, executed by Silvestre de Sacy himself. Of the numerous works that he wrote subsequent to this period, we may mention *Recherches sur les Langues Tartares* (1820), a work in some sort preparatory to his *Eléments de la Grammaire Chinoise* (1822), the grandest monument of the vast Sinological erudition and labor of Rémusat. Another of his important philological productions was his *Recherches sur l'Origine et la Formation de l'Écriture Chinoise* (1827). "Although acquainted," says M. Walckenaer, "with several of the most difficult languages of Asia, and with almost all the ancient and modern languages of Europe, he regarded such knowledge as only a means to an end. . . . In a crowd of treatises, dissertations, critical analyses, and translations, either published as separate works or inserted in *Mémoires*, he has endeavored to embrace everything relating to the nations whom he proposed to make known. Religious beliefs, philosophical systems, natural history, geography, political revolutions, the origins of races, biography, literature, manners, habits, and customs—he has treated all in an equally masterly style." Among the works of Rémusat which illustrate this *éloge* of M. Walckenaer are his *Étude Historique sur la Médecine des Chinois*; *Tableau Complet des Connaissances des Chinois en Histoire Naturelle* (unfinished); *Sur la Pierre Iu* (a curiously learned disquisition on a crowd of historical questions and religious rites); *Notice sur la Chine et ses Habitants* (in which the author treats of the extent, administration, manners, commerce, etc., of China); *Sur l'Extension de l'Empire Chinois en Occident depuis le Premier Siècle avant Jésus-Christ jusqu'à nos Jours*, a work that has thrown much light on the interesting question: Who were the barbarians that overthrew the Roman empire? Rémusat, in particular, paid great attention to the religions of China, except, strange to say, that of Confucius. He was the first to make known in Europe the life and opinions of the philosopher Laou-Tsze, head of the religious sect *Tou-tsé*, and wrote numerous works, more or less valuable, on the history of Buddhism. A list of his various works is given in the article "Rémusat," in the *Nouvelle Biographie Générale*, to which we are chiefly indebted for our information. In 1818 Rémusat became one of the editors of the *Journal des Savants*; in 1822 he founded the *Société Asiatique* of Paris, of which he was perpetual secretary; in the following year he was chosen a member of the Asiatic societies of London and of Calcutta; and in 1824 he was appointed curator of the oriental

department in the bibliothèque royale. He died of cholera at Paris, June 4, 1832, at the early age of 44.

REMY, or REMI, SAINT (Lat. *Remigius*), a saint of the Roman Catholic church, was born of a noble family of Laon, in Picardy, in the year 438 or 439. He was appointed, against his will, at the early age of 22, to the bishopric of Rheims, and his episcopate is memorable for the conversion of Clovis, who was baptized by Remy. It was on occasion of this ceremony that, contrasting our Lord and his cross with the idols whom Clovis had hitherto adored, Remy used the words which afterward became almost epigrammatic: "Adore henceforward what thou hast hitherto burned, and burn that which thou hast adored." Remy lived to see Gaul almost entirely Christianized, and died in his 93d or 94th year in 533. Some of his letters are preserved in the *Bibliotheca Patrum*, as also two documents under the title of *Testamenta*, the genuineness of which has been the subject of a curious controversy.

RENAISSANCE, the name given to the style of art, especially architecture, in Europe, which succeeded the Gothic, and preceded the rigid copyism of the classic revival in the first half of the present century. Under the heading **ITALIAN ARCHITECTURE** we have traced the rise and progress of the renaissance in the country of its birth. The spread of classical literature during the 15th and 16th c. created a taste for classic architecture in every country in Europe. France, from her proximity and constant intercourse with Italy, was the first to introduce the new style n. of the Alps. Francis I. invited Italian artists to his court during the first half of the 16th century. The most distinguished of these were Leonardo da Vinci, Benvenuto Cellini, Primaticcio, and Serlio. These artists introduced Italian details, and native architects applied them to the old forms to which they were accustomed, and which suited the purposes of their buildings, and thus originated a style similar to, though diverse from, that of Italy.

The Italian buildings were chiefly churches, St. Peter's being the great model. In France (as in the other countries n. of the Alps) the stock of churches was more than was required. The grand domestic buildings of Florence and Rome were actually needed for defense, and were founded in design on the old mediæval castles which the nobles occupied within the cities. The domestic architecture of France is rather taken from the luxurious residences of the monks, and although very graceful in outline and in detail, its buildings want the force and grandeur of the Italian palaces.

In the French renaissance, so much are the old Gothic forms and outline preserved, that the buildings of Francis I. might, at a short distance, be mistaken for Gothic designs, although, on nearer approach, all the details are found to be imitated from the classic. Such are the palaces of Chambord and Chenonceaux on the Loire, Fontainebleau, and many others. The churches of this period are the same in their principles of design. Gothic forms and construction are everywhere preserved, while the detail is as near classic as the designers could make it. St. Eustache, in Paris, is one of the finest examples of this transitional style.

From the middle of the 16th to the middle of the 17th c. a style prevailed which may be said to have combined all the defects of the renaissance. It was neither classic nor Gothic. It had no principles of construction or decoration save the individual caprice of the designer. This style, usually known as that of the time of Henry IV., is the basest which has been adopted in France, and has no redeeming qualities. It may be distinguished by the constant use of meaningless pilasters, broken entablatures, curved and contorted cornices, architraves, etc., all applied so as to conceal rather than to mark and dignify the real uses of the features of the buildings. The Tuileries, wrecked by the commune, showed all these defects. From this debased and meaningless style architecture gradually recovered, and during the 18th c. a style more becoming the dignity and importance of the *grand monarque* was introduced. The classic element now began to prevail, to the entire exclusion of all trace of the old Gothic forms. Many very large palaces are built in this style; but, although grand from their size, and striking from their richness and luxuriance, they are frequently tame and uninteresting as works of art. The palace of Versailles (q. v.) is the most prominent example. The two Mansards, one of whom designed Versailles, had great opportunities during this extravagant epoch. Their invention of giving a row of separate houses the appearance of one palace, which has ever since saved architects a world of trouble, was one of the most fatal blows which true street-architecture could have received. The e. front of the Louvre, designed by Perrault, is one of the best examples of the style of the age. Many elegant private hotels and houses in Paris were erected at this period. The most striking peculiarity of the style of Louis XIV. is the ornament then used, called rococo (q. v.).

The classic renaissance was completed in the beginning of the present century by the literal copyism of ancient buildings. Hitherto, architects had attempted to apply classic architecture to the requirements of modern times; now they tried to make modern wants conform to ancient architecture. In the Madeleine, for instance, a pure peripteral temple is taken as the object to be reproduced, and the architect has then to see how he can arrange a Christian church inside it! Many buildings erected during the time of the empire are no doubt very impressive, with noble porticoes and broad blank walls; but they are in many respects mere shams; attempts to make the religious buildings of the Greeks and Romans serve for the conveniences and requirements of the 19th century.

This has been found an impossibility—people have rebelled against houses where the window light had to be sacrificed to the reproduction of an ancient portico, and in which the height of the stories, the arrangement of the doors, windows, and, in fact, all the features were cramped, and many destroyed. The result has been that this cold and servile copyism is now entirely abandoned, and the French are working out a free kind of renaissance of their own, which promises well for the future; and is at the present moment, as the streets of Paris testify, the liveliest and most appropriate style in use for modern street-architecture.

In Spain the renaissance style took early root, and from the richness of that country at the time, many fine buildings were erected; but it soon yielded to the cold and heavy "Greco-Romano" style, and that was followed by extravagances of style and ornament more absurd than any of the reign of Louis XIV. The later renaissance of Spain was much influenced by the remnants of Saracenic art which everywhere abound in that country.

In England as in the other countries of Europe, classic art accompanied the classic literature of the period; but, being at a distance from the fountain-head, it was long before the native Gothic style gave place to the classic renaissance. It was more than a century after the foundation of St. Peter's that Henry VIII. brought over two foreign artists—John of Padua and Havenius of Cleves—to introduce the new style. Of their works we have many early examples at Cambridge and Oxford, in the latter half of the 16th century.

Longleat, Holmby, Wallaton, and many other county mansions, built toward the end of the 16th c., are fine examples of how the new style was gradually introduced.

The course of the renaissance in England was similar to its progress in France; it was even slower. Little classical feeling prevailed till about 1620. The general expression of all the buildings before that date is almost entirely Gothic, although an attempt is made to introduce classical details. The pointed gables, mullioned windows, oriels and dormers, and the picturesque outlines of the old style, are all retained long after the introduction of quasi-classic profiles to the moldings. This style, which prevailed during the latter half of the 16th c., is called Elizabethan, and corresponds to the somewhat earlier style in France of the time of Francis I. This was followed in the reign of James I. by a similar but more extravagant style called Jacobean, of which Heriot's hospital is a good example; the fantastic ornaments, broken entablatures, etc., over the windows being characteristic of this style, as they were of that of Henry IV. in France.

The first architect who introduced real Italian feeling into the renaissance of England was Inigo Jones. After studying abroad he was appointed superintendent of royal buildings under James I., for whom he designed a magnificent palace at Whitehall. Of this only one small portion was executed (1619–21), and still exists under the name of the banqueting house, and is a good example of the Italian style. Jones also erected several elegant mansions in this style, which then became more generally adopted.

In the latter half of the 17th c. a splendid opportunity occurred for the adoption of the renaissance style after the great fire of London. Sir Christopher Wren rebuilt an immense number of churches in that style, of which St. Paul's (q. v.) was the most important. The spire of Bow church and the interior of St. Stephen's, Wallbrook, are also much admired.

During the 18th c. classic feeling predominated, and gradually extended to all classes of buildings. In the early part of the century Vanbrugh built the grand but ponderous palaces of Blenheim and castle Howard, which have a character and originality of their own. To these succeeded a vast number of noblemen's mansions, designed by Campbell, Kent, the Adames, and others.

Many of these, like the contemporaneous buildings of France, are of great size and magnificence; but they are usually tame and cold in design, and a sameness pervades them all. They generally consist of a rustic basement-story, with a portico over the center, and an equal number of windows on either side. The portico is considered essential, and although perfectly useless, the light and convenience of the house are invariably sacrificed for it.

The further study of the buildings of Greece and Rome led, in the beginning of the present century, to the fashion of reproducing them more literally. All important public buildings were now required to be absolute copies of ancient buildings, or parts of them, or to look like such, and then the architect had to work out the accommodation as best he might. St. Pancras's church in London is a good example. It is made up of portions from nearly every temple in Greece! Many really successful buildings, such as St. George's hall, Liverpool, the high school and royal institution in Edinburgh, have been erected in this style; but they owe their effect not to their being designs well adapted to their requirements, but to the fact that they are copies from the finest buildings of antiquity.

Sir Charles Barry was the first to break away from this thralldom, and to return to the true system of designing buildings—those, namely, which have their general features arranged so as not only to express the purposes they are intended to serve, but in so doing to form the decorative as well as the useful features of the buildings. The Traveller's club-house and Bridgewater house in London are admirable specimens of his

design. There are no superfluous porticoes or obstructive pediments, but a pleasing and reasonable design is produced by simply grouping the windows, and crowning the building with an appropriate cornice.

As already noticed, a similar style of domestic architecture is now being worked out in France; but both there and in this country there has been a reaction against everything classic, and a revival of mediæval architecture has superseded that of classic, especially in ecclesiastical buildings. A very large number of churches has been erected within the last 20 years in the Gothic style, but it cannot be said that these are usually well adapted to the modern Protestant service. The most magnificent example of this style is the palace or houses of parliament at Westminster.

In Germany, Russia, and every country of Europe, the renaissance prevailed in a manner similar to that above described. In Germany there are few specimens of early renaissance, the picturesque castle of Heidelberg being almost unique as an early example. The Zwinger and the Japanese palace at Dresden, which are nearly alone as edifices of the beginning of the 18th c., show how poor the architecture of Germany then was. In the domestic buildings of Nuremberg, Dresden, and other towns of the n. of Germany, there are many instances of the picturesque application of classic detail to the old Gothic outlines.

One of the most striking examples of the revival of classic art occurred in Bavaria during the first half of the present century, under the auspices of King Louis. He caused all the buildings he had seen and admired in his travels to be reproduced in Bavaria. Thus, the royal palace is the Pitti palace of Florence on a small scale; St. Mark's at Venice is imitated in the Byzantine chapel-royal; and the Walhalla, on the banks of the Danube, is an exact copy (externally) of the Parthenon. The finest buildings of Munich are the picture-gallery and sculpture-gallery by Klenze, both well adapted to their purpose, and good adaptations of Italian and Grecian architecture.

In Vienna and Berlin there are many examples of the revived classic and Gothic styles, but the Germans have always understood the former better than the latter. The museums at Berlin, and many of the theaters of Germany, are good examples of classic buildings.—The domestic architecture of Berlin is well worthy of notice, many of the dwelling-houses being quite equal in design to those of Paris.

Of the other countries of Europe the only one which deserves remark for its renaissance buildings is Russia. St. Petersburg is, of all the cities of Europe, the one which best merits the title of a city of palaces. From the date at which the city was founded, these are necessarily all renaissance in character. They are nearly all the works of German or Italian architects, and are unfortunately, for the most part, in the coldest and worst style. The ornaments of the palaces are chiefly pilasters running through two stories, with broken entablatures, etc., and ornaments of the flimsiest rococo. The new museum, by Klenze, is, however, a marked exception.

Along with architecture, during the period of the renaissance, painting and sculpture (q.v.) and all the other arts took their models from the classic remains which were so carefully sought for and studied. All ornamental work, such as carving, jewelry, and metal-work of all kinds, followed in the same track. Mediæval niches and pinnacles gave place to the columns and entablatures of the classic styles, and the saints of the middle ages yielded to the gods and goddesses of ancient Rome.

RENAIX, a t. of Belgium, in the province of e. Flanders, picturesquely situated, 24 m. by railway s. of Ghent. Brewing, tanning, distilling, and salt-refining are carried on; and fine linen and damasks, woolen fabrics, hats, and tobacco are extensively manufactured. Pop. '70, 12,300.

RENAN, JOSEPH ERNEST, a renowned French theologian and orientalist, was b. in 1823 at Tréguier (Côtes-du-Nord). His first education he received at the hands of the priests who directed the school of his native place. At 16 years of age he was sent to Paris, where he entered the seminary of Abbé Dupanloup to prepare himself for the church. Three years later he went to Issy, and, having completed his philosophical studies there, to St. Sulpice. On leaving this, however, he declared himself unable to follow out the path traced for him. The theological and linguistic studies, to which he had devoted himself with rare industry, had led him to results which did not seem to allow him the exercise of priestly functions in his church. He took the place of *répétiteur* in a school, and here prepared himself for an academical career. In 1847 his memoir *Sur les Langues Sémitiques* ("On the Semitic Languages") obtained the Volney prize; and the following year, another memoir of his, *Sur l'Étude du Grec dans l'Occident au Moyen Âge* ("On the Study of Greek in the West during the Middle Ages"), was crowned. In 1848 he began to publish a periodical, *La Liberté de Penser* ("Liberty of Thought"), in which he embodied some of his most brilliant essays on theology, philosophy, philology, history, and the many variegated branches of his studies, which, however, were all merely preparatory to the great work for which he concentrated all his energies—viz., the investigation of the origin of Christianity, which, according to him, is as human and natural, and has grown out of the history and circumstances of the times in precisely the same manner as any other event in the records of humanity. His memoir, *Sur les Langues Sémitiques*, he expanded in 1855 into a *Histoire Générale des Langues Sémitiques* ("General History of the Semitic Languages"), which, with all its

shortcomings, is the most methodical and brilliant compilation on the subject. Of the variety of subjects to which he devoted his time besides, his numerous contributions to the *Revue des Deux Mondes* and the *Journal des Débats*, bear ample witness. In 1850 he published a historical essay, *Sur Averroes et l'Averroïsme*, for which he had collected materials on a scientific journey to Italy. In consequence of this he was appointed *employé* at the imperial library in Paris. He further produced translations of Canticles and the book of Job, with introductions and commentaries (*Le Cantique des Cantiques*, etc., 1860, *et Le Livre de Job*, etc., 1859). In 1860 he was sent by the emperor on a tour of exploration to Syria and Phœnicia, the results of which were given to the world in the *Mission de Phœnicie* (1864) and other works. On his return he was elected to the chair of Hebrew professorship at the collège de France; but his inaugural lecture made him, through its too free handling of theological matters, so obnoxious to those in power, that his course was first suspended, and finally his professorship was taken from him. His work, *La Vie de Jésus*, forming Part I. of his *Origines du Christianisme*, created a profound emotion throughout Europe. An abstract of it, in a more popular form, has been published by him under the title *Jésus. Histoire des Apôtres* (1866), *Saint-Paul* (1869), *Antichrist* (1873), and *La seconde Génération Chrétienne: Les Evangiles* (1877), are the subsequent parts in the series. Other works are: *Etudes d'Histoire Religieuse* (1856); *Essais de Morale et de Critique* (1859); *La Réforme Intellectuelle et Morale* (1873); *Dialogues et Fragments Philosophiques* (1876); *Mélanges d'Histoire et de Voyages* (1878); and his curious poem *Caliban* (1878). Renan was elected a member of the academy in 1878.

RENDEL, JAMES MEADOWS, 1799-1856; b. England, constructed many bridges, including floating bridges with steam power. His most famous engineering works are the harbors at Portland and Holyhead, and the bridge over the Laira in Plymouth harbor.

RENDSBURG, a fortified t. in the Prussian province of Sleswick-Holstein, stands at the point of junction of the river Eider and the Kiel canal, 67 m. n.n.w. of Altona by railway. Rendsburg is favorably situated for commerce, and carries on an active trade in timber. Pop. 75, 11,406.

RENÉ or **RENATUS I.**, surnamed "the good," titular king of Naples and Sicily, the son of Louis II., duke of Anjou and count of Provence, was b. in 1408 at Angers. René's paternal grandfather, Louis I., duke of Anjou, and second son of John the good, king of France, had been adopted in 1380 by Joanna I., queen of Naples, as her successor; and on his death, a few years afterward, his son, René's father, was crowned king of Naples and Sicily. He, however, did not derive any substantial advantages from this recognition of his presumed rights; and when, on his death and that of his eldest son, Louis II., René, as the next heir, endeavored to make good his pretensions to the great Neapolitan heritage, he found himself involved in disastrous disputes with numerous other aspirants to the coveted throne. René had married Isabella of Lorraine, and through her was also a claimant of the rich territories of Lorraine, and consequently brought upon himself the enmity of his wife's brother-in-law, the duke of Burgundy, who laid equal claim to the heritage of the ducal house of Lorraine. The best years of René's life were spent in the fruitless effort to establish these pretensions; but when, in 1442, his powerful rival, Alfonso of Aragon, took Naples, after a protracted siege, the struggle was virtually decided; and René recognizing at length the futility of his schemes, retired to his hereditary dominions in Provence, and thenceforth occupied himself with the administration of his territories, and with the cultivation of poetry and painting, in both of which he attained a degree of proficiency above the average of his age, as is shown by the poems and illuminated illustrations by his hand still preserved in the imperial library at Paris. In 1445 René gave his beautiful daughter Margaret in marriage to Henry VI. of England, and at the same time obtained from his royal son-in-law the restitution of Anjou and Maine, which had remained in the hands of the English since the successful wars of Henry V. This did not, however, prevent René from taking part in the wars of Charles VII. against the English in 1449; but after a brief stay with the army, René, wearied with the excitement and discomforts of war, retired to Aix in Provence, where for many years he attracted to his court the cultivators of song and romance, while he encouraged manufactures, and augmented the resources of the province by the introduction of improved methods of agriculture, and the importation of various useful trees and plants, and died in 1480, universally regretted by his subjects, among whom the memory of "the good king René" was long held in great veneration. René's sons had died before him; and so with him the house of Anjou became extinct, its territorial dominions lapsed to the French crown, and have since that period formed an integral part of France.

RENEWAL of a bill of exchange is matter of agreement between the parties, and a new bill is granted by the party liable to pay in substitution for the old one. The result is, that the former bill is suspended in its operation till the renewed one arrives at maturity. But the former one is not extinguished, for it revives if the renewed bill is not paid; and even though the renewed bill is paid, an action may be brought on the former bill to recover the interest due upon it.

RENFREW, a co. in n.e. Ontario, embracing Allumette island, having the Ottawa river for its n. and n.e. boundary; 17,040 sq. m.; pop. '71, 29,768. It is intersected by the Brockville and Ottawa railway, which terminates within its limits. Its surface is hilly and largely covered with heavy timber, which is the chief article of export and source of industry. It is drained by a large number of lakes and rivers, among them the Bonnechere and the Muskrat, which furnish extensive water-power. Its manufactories include axe factories, woolen mills, lumber mills, and grist-mills. Co. seat, Pembroke.

RENFREW (anciently *Strathgryffe*), a co. in Scotland, 31 m. long, by 13 broad, is bounded on the n. and w. by the river and Firth of Clyde, on the s. by Ayrshire, and on the e. and n. by Lanarkshire. Area, 254 sq. m., or 162,428 acres; pop. '61, 177,561; '71, 216,947.

Renfrew is very unequal in its surface, and consequently in the nature and quality of its soil; the highest portion of it, composing two-thirds of its surface, reaches to a height of 1240 ft above the level of the sea, and gradually declines to a level extending to some 12,000 acres. Renfrew was divided in 1815 into the upper and lower wards, with a sheriff-substitute for each. Owing to the great demand for dairy produce in the large towns in or near the county, nearly two-thirds of the arable land is kept under grasses. There are extensive mineral deposits in the county, employing a large number of people, and constituting a great source of commerce and wealth. The minerals wrought are coal (accompanied always by iron), limestone, and sandstone. In respect of commercial and manufacturing importance Renfrew is second only to Lanark of Scotch counties. The manufacture of soft goods, comprising silk, cotton, and muslin fabrics, is carried on to a great extent. The center of these branches of industry is Paisley; but weaving is carried on in almost every village in the county. The good roads and railways, together with the seaports of Greenock and Port Glasgow, afford ready means of transit both for home and foreign trade. The chief towns, besides these ports, are Renfrew (q.v.), Paisley (q.v.), and Johnstone (q.v.). Besides the Clyde, and some small streams, there are three rivers of considerable size, called the Black Cart, the White Cart, and the Gryffe. Of the whole acreage of Renfrew there were, in 1876, 92,994 acres under all kinds of crops: 18,187 acres were under corn crops, 7,360 under green crops, 18,556 in clover and grasses under rotation, and 48,582 in permanent pasture. There were in the co. in the same year 3,128 houses kept for agricultural purposes, 25,090 cattle, 32,969 sheep, and 1917 pigs. The valued rent in 1674 was £69,172 Scots, or £5,764. The valuation for 1878-79 was £643,906, exclusive of railways and public works, valued at £78,684. The parliamentary constituency, returning one member, in 1878-79 was 5,872.

Renfrew was the chief patrimony of the Stewards of Scotland, granted to them in 1404 by Robert III., since which time the eldest son of the reigning sovereign has borne the title of baron of Renfrew.

RENFREW, an ancient royal parliamentary and municipal burgh, capital of the county of the same name, stands on the s. bank of the Clyde, 6 m. w.n.w. of Glasgow. It contains an educational institution called the Renfrew grammar school and Blythswood testimonial, which was originally endowed by charter of Robert III., and is in part maintained by the town council. On the banks of the Clyde is a wharf, at which the Glasgow steamers touch. Silk and muslin fabrics are woven; and many of the inhabitants are employed in iron-works and in ship-building, which branches of industry have within recent years become important here. Pop. '61, of royal burgh, 3,412; '71, 4,163.

RENI, a t. of Bessarabia, at the confluence of the Pruth and the Danube, on the left bank of both rivers. It carries on a considerable trade, exporting large quantities of grain. Pop. about 8,000.

RENDEL, JAMES, a well-known English geographer, was b. near Chudleigh, Devonshire, 1742, and entered the navy as a midshipman at the age of 15, distinguishing himself under admiral Parker at the siege of Pondicherry. At the age of 24 he left the navy, and enlisted as an officer of engineers in the East India company's army, rising through the influence of his distinguished services under Clive to the grade of maj. Soon afterward he was transferred to the post of surveyor-general of Bengal, an office more in keeping with his tastes. While serving in the army he had prepared and published a *Chart of the Bank and Currents of Cape Agulhas* (1768), which attracted the general notice of geographers; and having retired from office (1782) with a pension of £600, he followed up this work by a succession of geographical works on India, the chief of which was *Memoirs of a Map of Hindustan* (Lond. 1783), new editions of which appeared in 1788, 1793, and 1800, each of which merits to be considered a distinct work. But his geographical investigations took a wider scope, for in 1792 he published a *Memoir of the Geography of Africa*, from the communications of maj. Houghton, and the relations of Ledyard and Hornemann; and in 1798 he aided Mungo Park in the arrangement of his travels, illustrating them by a map. Rennel had been elected a member of the royal society in 1788. The subject of the correctness of the ancient geographers being at that time much discussed, Rennel, though wholly ignorant of Greek, undertook the vindication of Herodotus (whose works he became acquainted with through the medium of a translation), and published in 1800 his *Geographical System of Herodotus Examined and*

Explained, a work of unrivaled merit, displaying as it does one of the grandest combinations of acuteness, sagacity, and research. A second edition was published in 1830. In 1814 appeared his *Observations on the Topography of the Plain of Troy*; and two years afterward *Illustrations (chiefly Geographical) of the Expedition of the Younger Cyrus, etc., and of the Retreat of the Ten Thousand*. After his death, which took place at London, Mar. 29, 1830, there were found among his papers several MS. works, including the *Investigation of the Atlantic Currents and those between the Atlantic and Indian Oceans* (Lond. 1832), in the composition of which book he examined the logs of all the ships of war and Indiamen which had traversed those seas for about 40 years previous, and reduced their observations to a general system; and *A Treatise on the Comparative Geography of Western Asia*, with an atlas, ancient and modern (Lond. 1831), a work of great labor and research, which had been prepared by the royal command, and the publication of which was partially defrayed at the king's expense. Rennel was one of the most remarkable men of his time: his works exhibit throughout the most earnest perseverance and industry, sound judgment, and wonderful sagacity.

RENNES (*Rénonnes* of the Romans, *Condate* of the Gauls), formerly the capital of the province of Bretagne, now the chief town of the dep. of Ille-et-Vilaine, is situated at the confluence of the rivers Ille and Vilaine. It is divided into the upper or new town, and the lower or old town. It is surrounded by ancient walls, flanked with towers, beyond which lie extensive suburbs. Three bridges unite the two divisions of the town, the older portions of which lie on the left bank of the Vilaine, and are often exposed to serious damage from inundations. The most noteworthy of the public buildings are the modern cathedral, whose interior is a very spacious hall of Grecian architecture; the stately palais de justice; the hôtel de ville; and the lycée. Rennes is the see of a bishop, and the seat of a high court of jurisdiction for Ille-et-Vilaine and several other adjacent departments, and has tribunals of first instance and of commerce. As the focus of main and branch-lines of railway between Paris and the n.w. of the empire, and commanding good river and canal navigation, Rennes is favorably situated for commerce; and in addition to the transport of the abundant farm produce of the neighboring districts, it carries on a considerable trade in its own manufactures, which include cotton and linen yarns, flannel stockings, lace, sail-cloths, earthenware, etc. Rennes was all but reduced to ashes by a great fire in 1720. Pop. '76, 53,598.

RENNET consists of the inner lining of the true stomach (see DIGESTION) of the sucking-calf, and depends for its use upon the acid gastric juice contained in it. It is prepared by removing the stomach from the animal as soon as killed, and scraping off the outer skin and all superfluous fatty matter. The membrane is then salted for some hours, and stretched out to dry. If perfectly dried, it will keep for a long time. When used, a small piece is taken and soaked in a little whey or water, and then added to the milk intended to be curdled.

RENNET, the common name, not only in English, but, with slight modifications, in French, German, and other languages, of a class of apples, including many of the most beautiful and pleasant varieties. They are of very regular and nearly globose shape; their skin has generally a rusty tinge, and often a kind of unctuousness to the touch; their flesh is finely granular; and besides being sweet and agreeably acid, they have a peculiar aromatic flavor. They do not keep well. The trees have a very regular habit of growth, and are very suitable for dwarf standards. The name rennet seems to be originally French—*reînette*, little queen.

RENNIE, GEORGE, an eminent English civil engineer, and the eldest son of JOIX was born in Surrey, Jan. 3, 1791, and at the age of 16 entered the Edinburgh university, being placed under the charge of prof. Playfair, in whose house earl Russell, then an Edinburgh student, also at that time resided. After attending a course of classics, mathematics, chemistry, and natural philosophy, he returned to London in 1811, and commenced the practical study of engineering under his father. In 1818 he was appointed the superintendent of the mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death in 1821, Rennie entered into partnership with his younger brother, John (afterward sir John Rennie), as engineers and machinery constructors; and during the existence of the firm it carried on an immense business, including the execution of most of the works which had been planned by the elder Rennie, and the completion of those which he had left unfinished. Their operations included the construction of bridges, harbors, docks, ship-yard and dredging machinery, steam factories, both in Great Britain and on the continent, and many of the great naval works at Sebastopol, Cronstadt, Odessa, Nicolaiev, and in the principal ports of England; they also made the coining machinery for the mints at Calcutta, Bombay, Lisbon, Mexico, and Peru; the biscuit, chocolate, and flour-mills at Deptford, Gosport, and Plymouth; and furnished marine engines for the war-ships of England, Russia, France, Italy, Mexico, etc. Besides these multifarious labors, they built ships both of wood and iron, drained large tracts of land in the midland counties of England, and Rennie superintended the construction of several continental railways. He was elected a fellow of the royal society in 1822, and was subsequently enrolled in similar societies at Dublin, Turin, Rotterdam, etc. He is the author of "Experiments on the Strength of Materials," "The Frictions of Solids," and

"The Frictions of Fluids," published in the *Philosophical Transactions*. He also contributed memoirs to the *Transactions* of the civil engineers. He died March 30, 1806. His brother, sir JOHN, was knighted on the occasion of the opening of the new London bridge (1831), which he executed from his father's designs. He designed and executed Southwark and Waterloo bridges, and completed the drainage of the Lincolnshire coast, begun by his father. He died 1874.

RENNIE, JOHN, an eminent civil engineer, was born at Phantassie, near East Linton, East Lothian, June 7, 1761. His preliminary education was obtained at the parish-school of East Linton, and supplemented by two years at Dunbar, where he was indoctrinated into pure mathematics. After being for some time a workman in the employment of Mr. Andrew Meikle, celebrated in connection with the thrashing-mill (q. v.), he proceeded to Edinburgh, where he attended the lectures on natural philosophy by Dr. Robison, and those on chemistry by Dr. Black (q. v.). Furnished with a recommendation from prof. Robison, he visited (1780) the works of Messrs. Boulton & Watt at Soho, near Birmingham, and was immediately taken into employment by that eminent firm. Here his mechanical genius soon displayed itself; and so highly did Watt esteem Rennie, that he gave him, in 1789, the sole direction of the construction and fitting-up of the machinery of the Albion mills, London; and the ingenious improvements effected in the connecting wheel-work were so striking, that Rennie at once rose into general notice as an engineer of great promise. Abundance of mill-work now flowed in upon him, and the thorough efficiency of his workmanship greatly contributed to his fame. To this branch of engineering he added, about 1799, another—the construction of bridges; and in this branch also his pre-eminent talent and ingenuity displayed themselves. The elegance and solidity of his constructions, the chief of which were raised at Kelso, Leeds, Musselburgh, Newton-Stewart, Boston, New Galloway (and at other places afterward mentioned), were universally admired; Rennie's greatest work in this department was the Waterloo bridge over the Thames, said to be the noblest structure of its kind in the world, and it certainly combines in the happiest proportions the qualities of grandeur and simplicity. It was commenced in 1811, and finished in less than six years, at a cost of more than £1,000,000. Another of his works is the Southwark bridge, which was built on a new principle, cast-iron arches resting on stone piers, and was finished in four years at an expense of £800,000. He also drew up the plan for the London bridge, which, however, was not commenced till after his death. We have only space to enumerate the rest of his great engineering achievements: he superintended the execution of the Grand Western canal in Somerset, the Polbrook canal in Cornwall, the canal joining the Don and Dee in Aberteen, that between Arundel and Portsmouth, and chief of all, the Kennet and Avon canal between Newbury and Bath. The London docks, the East and West India docks at Blackwall, with their goods' sheds, the Hull docks, the Prince's dock at Liverpool, and those of Dublin, Greenock, and Leith, were all designed, and wholly or partially executed under his superintendence. He also planned many improvements on harbors and on the dockyards of Portsmouth, Chatham, Sheerness, and Plymouth; executing at the last-mentioned port the most remarkable of all his naval works, the celebrated breakwater. Rennie died Oct. 16, 1821, and was buried in St. Paul's cathedral. Rennie's great merit as an engineer consisted in his almost intuitive perception of what was proper to be done to effect the assigned purpose. Another striking characteristic of his works is the remarkable combination in them of beauty and durability. In this respect, Rennie had no rival; and though his works are frequently objected to on the ground of their expensiveness, yet their lasting qualities will in the end more than compensate for this. In person Rennie was of extraordinary stature and herculean strength—characteristics which have for a lengthened period distinguished his family, and with reference to which numerous tales are still current regarding many of his relatives.

RE'NO, a co. in s. Kansas; drained by the Arkansas and Good rivers; traversed by the Atchison, Topeka and Santa Fé railroad, 1260 sq. m.; pop., '80, 12,824—11,395 of American birth; 79 colored. The surface is mostly prairie and fertile; wheat, oats, corn, potatoes, and dairy products are the staples. Co. seat, Hutchinson.

RENO, JESSE L., 1823-62; b. Va.; graduated at West Point, 1846; was present at the Mexican battles of Cerro Gordo and Chapultepec, and for his gallantry was brevetted capt. He was assistant professor of mathematics at West Point; served in the coast survey and ordnance department, and at the outbreak of the rebellion had the rank of capt. He was made a brig.gen. of volunteers, and in Burnside's expedition to North Carolina had command of the second brigade, and distinguished himself at Roanoke Island, fort Barton, and New-Berne. In 1862 he was ordered to re-enforce McClellan, and later joined Pope's army. He commanded the 9th corps at the battle of Manassas; and at South Mountain, where he was killed, his command was in the front engaged all day, and his efforts were the means of securing victory to the federal forces.

RENSSELAER, a co. in e. New York, adjoining Massachusetts; bounded on the w. by the Hudson river; drained also by the Hoosac river and Kinderhook creek; traversed by the Troy and Boston, the Hudson River, and the Harlem Extension railroads, and other railroads centering in Troy; about 645 sq.m.; pop. '80, 115,341—88,957 of Ameri-

can birth. The surface is hilly. The Taghanic mountains cross the e. part. Quartz and slate are found. The soil in the valleys is fertile. The principal productions are corn, wheat, oats, hay, and flax. The manufacturing interest is very extensive and valuable. There are great iron foundries, manufactories of agricultural tools, etc. Co. seat, Troy.

RENSELAER POLYTECHNIC INSTITUTE, in Troy, N. Y., endowed by Stephen Van Rensselaer as a school of theoretical and practical science; organized, 1824. It has long had high reputation in its special department. The studies of the course are designed to secure to all the graduates a professional preparation, at once thorough and practical, for the following specialties of engineering practice: the location, construction, and superintendence of public works, as railways, canals, water-works, etc.; the design, construction, and management of mills, iron-works, steel-works, chemical works, and pneumatic works; the design and construction of roofs, arch bridges, girder bridges, and suspension bridges; the design, construction, and use of wind motors, hydraulic motors, air-engines, and the various kinds of steam-engines; the design, construction, and use of machines in general, and the determination of their efficiency; the survey of rivers, lakes, and harbors, and the direction of their improvements; the determination of latitude, longitude, time, and the meridian in geographical explorations, or for other purposes, together with the projection of maps; the selection and test of materials used in construction; the construction of the various kinds of geometrical and topographical drawings. The site of the institute buildings on the eastern slope of the city combines the advantages of a commanding position and quiet surroundings with great convenience of access. The observatory occupies an elevated site, and commands a good horizon. It consists of a central or main building, 30 ft. sq., and 3 wings; the total length being 76 ft., and the breadth 60 feet. It is surmounted by a dome, under which is the large pier designed for an equatorial telescope. The e. wing contains piers for the meridian circle and its collimators, and the transit instrument. The other wings are to contain the computing and clock rooms, and library. In the Winslow laboratory building are the metallurgical laboratory and the chemical laboratory and lecture-room. The collection of minerals, shells, herbs, and woods, from all parts of the world, is very large; the metallurgical collection is rich; the chemical cabinet contains specimens illustrating all the principal manufactures involving chemical science. The library contains many valuable scientific works. It has recently been increased by a valuable collection of American and foreign scientific periodicals, and is accessible to all the members of the institute. It had (1878) 18 teachers and 166 students. Hon. James Forsyth, president.

RENT, in political economy, is a term applied to the profits drawn from land, houses, or other immovable property, termed in England "real property." It is colloquially applied to these profits only when the property is hired by a tenant who pays for the use of it. It was long before a distinction was made between such letting and hiring and that of any other commodity, such as a ship or a wagon. But political economists found that there was a fundamental distinction, affecting large questions not only in political economy but in state politics. These are connected with the specialty that other profits, whether from the letting of articles or otherwise, arise out of the acts of those to whom the articles belong; but the rent of land is a fund that exists through external causes, over which the owner has no control, and in certain conditions *must* exist whoever may draw it. When "the theory of rent," as it was termed, dawned upon the economists, and was but partially seen, they developed it in different formulas, which appeared to be different theories, but in reality were crude forms, tending, though complicated in themselves, to the simple principle, that the pressure of population on the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. In an enlarging and aggrandizing country like Britain, the phenomenon is in constant gradual operation: but it will be best illustrated by supposing an instance of sudden and extensive action. Suppose there is an island in which 1000 people find enough for their wants in the natural produce of its most fertile soil. Suddenly 500 people become added to the population, and an increase of the existing food to the extent of one-half is required. The shape in which this increase will take place will be competition, by the offer of an enhanced price for food, and that enhanced price will tempt people to bring under cultivation the inferior lands. The owners, however, of the old rich lands will not see their neighbors getting prices a third higher than themselves; they, too, will sell their produce at the market price, and the difference between this and the old value will be *rent*. It is of no moment, in the economic question of the existence of the element, that the owner of the rich soil does not let it; if he eats his bread cheaper than his neighbor, that is merely the form in which he derives the advantage of *rent*. The importance of this view, both in politics and economics, is that rent *must exist, and cannot be got rid of*. Whoever has at his command better land than the worst that is cultivated, holds rent. It is in vain, therefore, to think of destroying the "monopoly," as it is sometimes called, of land-owners; it revives as naturally by an economic law, as water finds its level by a physical law. If you were to divide all the land in Britain tomorrow in equal portions among the inhabitants, the value of it would be greatly deteriorated by the change, but in time some patches would become more valuable than others, and

worth "rent," while the frugal and industrious would gradually be absorbing the portions of the idle and extravagant, and accumulating estates. In fact, to the mere consumer, it is of no moment who has the land, provided it is in the hands that can render it most productive. To this end, it is more profitable that the land of a country should be in the market, and obtainable by those who, being ready to give most for it, are able to work it to most profit. In France, where land is divided among the owner's descendants, the consequent breaking up into small patches, not necessarily in the hands of persons able or willing to cultivate them, is detrimental to the value of the land at large. On the other hand, an entail system, such as that which predominated, and still to a certain extent exists in Scotland, is detrimental, by keeping the land out of the market, and necessitating that it shall belong to a certain person, who has perhaps neither the ability nor the capital to turn it to its best purpose. In the struggle which terminated in the establishment of free trade in 1846, the "theory of rent" was referred to with much alarm, and it was said that when grain was brought from abroad, a reversal of the action creating rent would occur, from the inferior lands falling out of cultivation. Some free-traders admitted this as a necessary evil, but others said that the expansion given to commerce would increase the demand for the produce of the soil, while the home-growers would have a monopoly from their vicinity. In fact, the increase of trade and riches has been so great, that the value of land has greatly increased since the establishment of free trade, and that although half our bread stuffs come from abroad. The great increase has been in the rearing of butcher-meat, which the increased wealth of the people has enabled them to buy.

RENT, in English law, is an incident to the tenure created between a lessor and lessee. It consists not necessarily of money, but may be a quantity of corn, or a peppercorn, or a flower. Where lands are held rent-free, it is usual for the landlord to reserve some nominal rent, merely as an acknowledgment of tenancy. In the ordinary case of leases, a payment of a fixed sum of money is reserved annually for the benefit of the landlord. It is incidental to rent that the landlord can, if it is not duly paid, distrain the tenant's goods, or, indeed, any person's goods found on the premises; i. e., the landlord can seize these and sell them without any judicial authority, in order to pay the rent. No express agreement between landlord and tenant is necessary to give the landlord this power of distress. The rule is, that rent issues out of all and every part of the premises, and whatever goods are found on any part of the premises can be distrained by the landlord. Sometimes the owner of land gives a third party a right to a certain rent out of his lands, by way of security, and it is called a rent-charge; the party entitled to the rent-charge having power to distrain also for the rent, though having no other right to the lands. In Scotland, though the general rules as to rent do not substantially differ, the landlord's power of sequestration is not identical with the English power of distress. See **LANDLORD AND TENANT**.

RENTON, a small t. in the co. of Dumbarton, and 2 m. n. of the town of that name, on the right bank of the Leven. Smollett, the novelist and historian, was born in the neighborhood, and is commemorated by a monument in the town. Pop. '61, 2,891; '71, 3,087, who are employed in the printing, dyeing, and bleaching works on the Leven.

RENUNCIATION, as a legal term, is the renouncing or abandoning of a right. In England, the term is used solely in reference to an executor who has been nominated in a will, but who, having an option to accept it, declines to do so, and in order to avoid any liability, expressly renounces the office. This he may do by letter addressed to the court of probate.—In Scotland, the term is also used in reference to an heir, who is entitled, if he pleases, to succeed to the ownership of heritable property, but, from the extent of the incumbrances, prefers to renounce the character of heir. So the renunciation of a lease in Scotland is used in the same sense as the surrender of a lease in England.

RENVILLE, a co. in n.w. Dakota, having the British possessions for its n. boundary and the Plateau du Coteau du Missouri on the s.w.; 1660 sq.m.; pop. '80 (with that of 4 other counties). 247—181 of American birth, 4 colored. It is drained by the Rivière de Lacs and the Mouse river, and has a level surface, with a soil of great productiveness very little cultivated.

RENVILLE, a co. in s.w. central Minnesota, drained by the Minnesota river; traversed by the Hastings and Dakota railroad; about 1000 sq.m.; pop. '80, 10,791—6,556 of American birth. The surface is level, with little timber. The soil is fertile. The principal productions are corn, oats, and wheat. Co. seat, Beaver.

RENWICK, JAMES, LL.D., an American author and physicist, was born about 1785, and graduated at Columbia college, New York, in 1807. In 1820 he was appointed professor of chemistry and physics in that college, a position he held until 1854. In 1838 he was appointed by the U. S. government one of the commissioners to explore the line of the boundary, then settled by the Ashburton treaty, between Maine and New Brunswick. In addition to his collegiate duties he wrote the biographies of Robert Fulton, David Rittenhouse, and count Rumford, in Sparks's *American Biography*; a *Memoir of De Witt Clinton* (1834); *Treatise on the Steam-engine* (1840—41). His text-books, *Outlines of Natural Philosophy* (1832), and *Outlines of Geology* (1838), were the first works of their

kind published in the United States, and, with his other educational works, have passed through numerous editions. Renwick died in 1863.

RENWICK, JAMES, b. New York, 1819; educated at Columbia college. He constructed the distributing reservoir of the Croton aqueduct, and was for some years an engineer on the Erie railroad. Among the buildings designed by him are Vassar college, Poughkeepsie; St. Patrick's cathedral, and Calvary church, New York; and the Smithsonian institution at Washington.

REPAIRS is the legal as well as popular term to denote the repairs done to a house or tenement by a tenant or landlord during the currency of the lease. In England the burden of repairs is at common law thrown on the tenant, so that unless the lease expressly say that the landlord is to do the repairs, the tenant will be bound, but generally the lease states who is to do the repairs; and it is only ordinary repairs that the tenant is bound to do. In the lease of farms the tenant is bound only to keep the house in repair and not the out-buildings, though he is bound to keep the fences in repair. If the landlord is bound to do the repairs and fails to do them, the tenant is not entitled to quit the premises on that account, though he will be entitled to sue the landlord for damage caused by the want of repairs. In Scotland the landlord is bound at common law to put the premises into tenable repair at the commencement of the lease. The tenant is then bound to keep them in ordinary repair, but not to keep them in repair where some hurricane or extraordinary cause has done injury.

REPEAT, in music, a character indicating the repetition of the part or strain to which it applies. It consists of two perpendicular lines through the staff, with dots before

them and between the lines of the staff—  placed at the close of the strain to be

repeated. When a series of notes has to be repeated from the beginning of the piece, this sign is inserted at the place where we have to return to the beginning. But when

the repetition is not from the beginning of the piece, a reversed repeat  must

be placed at the point where the repetition begins, the passage to be repeated being inclosed by the two signs. When the following strain is also to be repeated, we have

the dots placed on both sides of the repeating sign . When a passage of

some length is to be repeated, with an alteration at the end, a curved line with the figure 1, *1ma*, or *prima volta* (Ital. first time) is placed over the part which is to be altered, the sign of the repeat follows, and then the altered termination with 2, *2da*, or *seconda volta* (Ital. second time) placed over it.

The words *da capo*, abbreviated D. C. (Ital. from the beginning), indicate that a piece is to be repeated from the beginning. But if that repetition is only to extend to a particular point, at which the movement or piece finally closes, that point is indicated by the word *fine* (Ital. end), or the letter F. If, however, the repetition is to begin, not from the commencement of the piece, but from another point, the sign  is placed over the point, and the words *dal segno*, abbreviated D. S. (Ital. from the sign), are used to indicate the point after which the repetition is to begin.

REPETITION, in Scotch law, means the repayment of money which had been received by mistake or ignorance. The form of action by which money is so recovered was, in the Roman law, called *condictio indebiti*, and the law of Scotland adopts the same expression. The maxim is, that if money has been paid under some mistake as to the law, it cannot be recovered; but if it was paid under a mistake as to a matter of fact, then it may be recovered. In England the same doctrine holds, and the action is called an action for money had and received.

REPLEADER, in English law, is a right to plead again, or deliver a fresh pleading in consequence of the issue which had been joined not meeting or exhausting the real point in dispute. This right is much abridged, in consequence of the liberality now used in amending the record.

REPLEVIN, in English law, is a form of action by which goods which have been seized under an illegal distress are taken back (security being given to the amount for which the goods were distrained), and the action of replevin commenced, to try the legality of the seizure.

REPLEVIN, in law (*ante*), originally used to recover chattels taken as a distress, but has come to apply to all cases of illegal taking, and is even brought in some states for the recovery of specific goods to which the plaintiff sets up title. It differs from detinue in that it rests upon an illegal taking; from the other personal actions, in that it lies to recover the specific chattels alleged to have been illegally taken. Under the writ the sheriff takes possession of the property therein specified, which he delivers to the plaintiff after the latter has given satisfactory security that he will establish his title or return the property. Judgment for the plaintiff establishes his title, and includes damages for the taking and detention. The action is brought to regain possession, and cannot be maintained if the property have been restored. It lies to recover all personal property which can be specifically distinguished from other property of the same kind; but not for things annexed to the realty, nor for papers relating to the realty.

REPLICATION, in the English common law, means the pleading of the plaintiff in answer to the defendant's plea. The plaintiff's first pleading is the declaration, which is answered by the defendant's plea, and which in turn is answered by the plaintiff's replication.

REPORTING, PARLIAMENTARY, accounts of single speeches, and, at times, of entire debates in the English parliament, have come down to us from a very early period, and in the voluminous work entitled the *Parliamentary History of England*, we possess the most valuable historical work in our language. The earlier volumes of the journals of the house of commons contain short notes of speeches, which the clerks made without the authority of the house; but all the later volumes record nothing but the votes and proceedings—the *res gestæ*, in fact. Sir Symonds d'Ewes, who may be considered our first parliamentary reporter, has left us a journal of queen Elizabeth's parliaments. The session of 1621 was also reported from notes taken by a member. The commons' journals contain notes of speeches in the parliaments of James I. and James II. Rusworth, assistant-clerk in the long parliament, 1640, took down in a species of short-hand any speech of importance, and furnished Charles I. with a copy of the king's own speech when he made the attempt to seize the five members. His account of *Remarkable Proceedings in Parliament* forms one of the most valuable portions of his *Historical Collections*. We are also indebted to Thurloe and Gray for notices of what occurred in parliament. During the reign of William III., a member now and then sent a copy of his speech to the newspapers, for printing which, however, they were sometimes called to account. In the reign of queen Anne, a monthly pamphlet, called the *Political State*, gave an outline of the debates in parliament. In the reign of George I., the *Historical Register*, published annually, professed to give reports of parliamentary speeches. The *Gentleman's Magazine* began a monthly publication of the debates, the number for Aug., 1735, containing a report of the debate in the house of lords on the previous Jan. 23. Cave, the publisher, continued the practice in succeeding numbers, and his systematic proceedings are thus described by sir John Hawkins: "Taking with him a friend or two, he found means to procure for them and himself admission into the gallery of the house of commons, or to some concealed station in the other house, and there they privately took down notes of the several speeches, and the general tendency and substance of the arguments. Thus furnished, Cave and his associates would adjourn to a neighboring tavern, and compare and adjust their notes; by means whereof, and the help of their memories, they became enabled to fix at least the substance of what they had lately heard and remarked. The reducing this crude matter in o form was the work of a future day and an abler hand—Guthrie, the historian, whom Cave retained for the purpose." There was, however, no publication of the debates during the sitting of the houses; parliament was always prorogued before anything said in the course of the session was given in the magazine. At first, the names of the speakers were cautiously indicated by the first and last letter only, and in many cases the speaker's name was wholly omitted. Growing bolder by degrees, Cave printed the names at length. The house of commons soon took the alarm. The publication of the debates of either house had been repeatedly declared to be a high breach of privilege. Sir Symonds d'Ewes gives us a resolution of the lower house in the 31st Eliz. 1588, that "speeches used in this house be not any of them made or used as table-talk, or in any wise delivered in notes of writing to any persons whatever, not being members of this house." In 1698 the lords agreed to a standing order, which is still unrepealed, declaring "that it is a breach of the privilege of this house for any person whatsoever to print, or publish in print, anything relating to the proceedings of the house, without the leave of this house." The commons followed up several previous resolutions to the same effect, by ordering, in 1728, "that it is an indignity to, and a breach of, the privilege of this house, for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers, or publishers of any such newspaper, this house will proceed against the offenders with the utmost severity." In 1738 speaker Onslow called the attention of the house to the breach of its standing orders by Cave and others. Sir Thomas Winnington exhorted the commons not to be less jealous of their privileges than the other house, which had lately punished some printers for publishing their protests. "What will be the consequence," he asked, "if you allow these reports to go on unchecked? You will have the speeches of this house every day printed, even during

your session, and we shall be looked upon as the most contemptible assembly on the face of the earth." The result was another thundering resolution against the publication of debates "either while parliament is sitting or during the recess," and a threat to proceed against offenders with the "utmost severity." The reports, notwithstanding, still appeared, but under the disguise of "debates in the senate of Lilliput," in the *Gentleman's Magazine*; and "debates in the political club," in the *London Magazine*. The celebrated Dr. Johnson was employed by Cave in the composition of his parliamentary debates, and the reports from 1740 to 1743 are held to have been entirely prepared by him; sometimes with the assistance of the above-mentioned Guthrie, who had a good memory, and used to bring home as much as he could recollect from the house; and sometimes, according to Boswell, with no other aid than the names of the orators and the side they took. When it was observed to Johnson that he dealt out reason and eloquence pretty equally to both parties, he remarked; "I took care that the Whig dogs should not have the best of it." It was not till 30 years later that the parliamentary debates descended from the magazines to the newspapers. The latter had, however, for some time resolved to report the debates (Woodfall's *Junius*, iii. 345), and they took advantage of the popular excitement arising out of the Luttrell-Wilkes election for Middlesex, to try the right of the house to interdict the publication of its proceedings.

The ever-memorable contest between parliament and the press began at the close of the year 1770. The house of commons followed up another solemn threat by prompt action. Two printers, Thompson and Wheble, were ordered to attend at the bar, and, upon their contempt, were ordered into custody. On Mar. 12, 1771, complaint was made against W. Woodfall, printer of the *Morning Chronicle*; J. Miller, of the *London Evening Post*; and four other printers of London daily papers, for printing the proceedings of the house. The debates were unusually violent; there were 23 divisions; and the house did not adjourn until four A.M. The printers were ordered to attend. Some surrendered, and on asking pardon on their knees at the bar, were discharged. Miller, not surrendering, was ordered into the custody of the sergeant-at-arms. His messenger arrested Miller within the precincts of the city of London, and was immediately given into custody by Miller for assault, and carried before the lord mayor, the right hon. Brass Crosby. The deputy sergeant-at-arms attended before the lord mayor, and explained the circumstances; but his lordship declared the speaker's warrant illegal, discharged Miller from custody, and committed the messenger for assault. Wheble and Thompson had been carried respectively before aldermen Wilkes and Oliver, who immediately discharged them, and bound them over to prosecute, and the speaker's messenger to answer a charge of assault and false imprisonment. The house of commons was furious. It had had enough of Wilkes, but ordered the attendance of the lord mayor (a member of the house) in his place, and also of alderman Oliver. The aldermen of London attended the house, and pleaded their own cause, alleging that their charters exempted the citizens from any law process being served upon them except by their own officers. The house ordered its various resolutions to be read, prohibiting the reporting of its proceedings by any, even its own members, and then committed alderman Oliver to the tower. The lord mayor, who was suffering from gout, was excused from further attendance that day, but Wilkes was ordered to attend at the bar on April 8. The defiant alderman was ready for the fray, but the house evaded the meeting by adjourning from the 7th to the 9th. The lord mayor, on the 27th, was sent to join alderman Oliver in the tower. The city of London loudly protested against the arbitrary proceedings of the house, and the whole country responded to the appeal. The power of parliament to imprison ceases at the end of the current session, and on the day of prorogation, July 23, the lord mayor and alderman Oliver marched out of the tower in triumph, and at night the city was illuminated. A few days afterward, the speaker's messenger who had arrested Wheble was tried at Guildhall for the assault, found guilty, fined 1s., and imprisoned for two months in the Compter. Next session, the house of commons tacitly acknowledged itself beaten. The printers defied the house, continued to publish their proceedings, and slept, notwithstanding, secure in their beds. In a short time, the house of lords also conceded the point. The victory was complete, and no attempt has since been made to restrain the publication of the debates and proceedings of parliament. The resolution affirming that it is a high indignity to, and "notorious breach of, the privileges of the house to publish the debates," still remains unrevoked on the journals. Although debates are now daily cited in parliament from printed reports, and galleries have been constructed for the accommodation of the reporters, yet for some years after the triumph of the press, the gallery of the lower house was occasionally shut during debates. During the American war, the public were more than once excluded from the gallery for a whole session. It is still in the power of any member, who may call the speaker's attention to the fact that "strangers are present," to exclude the public and the reporters from the house. The power has frequently been exercised during living memory, but on such occasions some one or more members who have dissented from this course have taken notes of the speeches, and have avowedly sent them to the newspapers.

The old machinery of newspaper reporting was susceptible of immense improvement. One of the Woodfalls (a brother of the Woodfall of Junius) had so retentive a memory

that he went by the name of "Memory Woodfall." When editor of the *Morning Chronicle*, he used to listen to a debate in the gallery, and write it out next day, the taking of notes being at that time forbidden. The employment of only one reporter for the whole night necessarily caused great delay in the publication of the paper, Woodfall's journal sometimes not being ready until nine or ten o'clock at night. The first great improvement was made by Mr. Perry, a native of Aberdeen, who succeeded Woodfall in the management of the *Morning Chronicle*. He established a corps of parliamentary reporters to attend the debates of both houses every night in succession. He thus brought out the night's debate on the following morning, anticipating his rivals by ten or twelve hours. The superior excellence of the reports thus obtained, as well as their more rapid publication, soon made the new system universal. The improvement in the reports of the debates from the period of the American war until the year 1815, was but gradual. At the close of the war, however, public attention being directed with almost exclusive anxiety to domestic affairs, the publication of parliamentary debates became an object of national importance, and in the course of a few years assumed its present full, detailed, and accurate character. Increased facilities for the discharge of their important and arduous duties were from time to time given to the reporters. Formerly, they had no means of entering the strangers' gallery except those which were common to the public generally. On days when an interesting debate was expected, they were obliged to take their places on the stairs early in the forenoon, and, after standing there for many hours, to depend for their chance of getting in by battling their way in the crowd when the door opened. It happened one night during Mr. Pitt's premiership that the gallery was more than usually thronged in expectation of an important speech from the minister. The reporters, unable either by force or entreaty to obtain even tolerable accommodation, took counsel together. They left the house; and next morning, "instead of the rounded periods of the minister, there appeared nothing but one dire blank, accompanied by a strong comment on the grievance in which it had originated." Mr. speaker Abbott, not, as it was believed, without concert with the vexed and aggrieved minister, immediately directed the appropriation of the uppermost bench of the gallery to the reporters' exclusive use, with a door in the center, by which they alone had a right to enter. Soon after, a small "reporters' room" was added. The lords followed the lower house in providing accommodation for the press. During the debates on Catholic emancipation, a small space below the bar was railed off for them, and a session or two afterward, a seat was formally set apart for the reporters. When the houses of parliament were destroyed by fire in 1834, an exclusive gallery was allotted to the reporters in both chambers of the temporary structure in which the legislature held its sittings. This arrangement has been continued in the splendid new palace of Westminster, in which the two houses now hold their deliberations. In the house of lords, the reporters' gallery faces the throne and the woosack, and is one of the most prominent internal features of the edifice. Complaint having been made of the inaudibility of the speakers, their lordships appointed a select committee, examined the reporters, the architect, etc., and took all possible measures to make themselves heard in the gallery. In the house of commons, the reporters' gallery is behind the chair. Both houses provide them with rooms and other conveniences for transcribing their notes. In the lower house, one of the committee rooms has been set apart for their use; and a room occupying the site of the old star chamber has recently been given to them for a club-room.

The modern process of parliamentary reporting may be best described by a sketch of the arrangements made by the *Times* newspaper for a due and expeditious transcript of the debates. The *Times* parliamentary corps is sixteen in number, who are equally divided between the two houses. When one house rises, the entire corps is available for duty in the other, so long as it sits. It thus happens that one of a series of reporters is constantly in the gallery of the lords, and another in the commons. Like sentinels, they cannot leave their places until they are relieved by a colleague, but this relief takes place with unvarying regularity every quarter of an hour. When both houses are sitting, each reporter has thus an hour and three-quarters for the work of transcribing his short-hand notes for the printer—a sufficiently short interval, when it is remembered that a moderate speaker will fill three-quarters of a column, and a rapid speaker not unfrequently a column, in a quarter of an hour. When his turn again comes round, each reporter must be ready to resume the duty of note-taking, and afterward that of transcription for the press. By maintaining this quick succession of reporters, the process of writing for the press is never interrupted until the whole debate of the evening in both houses is in the hands of the printer. A long speech may thus be said to extend from the mouth of the speaker to Printing House square. A part will be wet with ink on the reporters' table; one section will be traveling over the Thames embankment in swift relays of cabs; a portion, becoming larger every few minutes, will be in the hands of the compositors, and a proof-sheet ready printed, of the earlier passages, will be on the desk of the editor. On some few occasions, when a minister has been more than usually anxious to secure the accurate publication of important statements, a proof impression of a verbatim report of nearly the whole of his speech has been placed in his hands, to his extreme astonishment, as soon as he resumed his seat. The mechanical arrangements of the printing-office are equally designed to secure expedition and accuracy. The parliamentary system of the other morning newspapers resembles that of the *Times*, but as the numerical

strength of their corps does not approach that of the leading journal in any case, the periods of note-taking and "relief" proportionately vary.

The system of parliamentary reporting underwent a change of great importance about 1847, when the electric telegraph was brought into general use by companies formed to work it. They proposed to supply papers out of London with London news, and a report of parliamentary debates was part of the news thus supplied. In order to get this report, the telegraph company obtained admission to the gallery for its reporters, and thus broke the monopoly which the London daily newspapers had up to that time enjoyed. Subsequently, when the electric telegraphs passed into the hands of the government, the parliamentary reports for newspapers out of London were provided by press agencies, and the accommodation in the reporters' gallery had to be increased for them. With the growth of provincial newspapers, the demand for more reports than the agencies supplied was felt, and the more powerful newspapers endeavored to secure special reports for themselves by the assistance of reporters' who were engaged on the London press. In this way they were able to get and publish reports often much longer than those printed in London. This, however, was only done at great inconvenience, and an effort was made to obtain for leading provincial newspapers a right of admission to the reporters' gallery. These claims were considered by a special committee of the house of commons, which in 1879 reported in favor of them; but consideration of the report was deferred to another session.

A few years ago, the object desired by newspaper proprietors was not a literal report, but what may be called the spirit of a speech—a faithful abridgment, in fact, of the sentiment, matter, and style of the speaker. Parliamentary reports subsequently became more diffuse, the debates of a single evening not unfrequently occupying between 20 and 30 columns of small type. This, however, has not been maintained, and though much might be said against the reporting at great length of important speeches, there can be nothing said in favor of such condensation of all speeches as prevails in most of the London newspapers—the *Times* and the *Standard* being exceptions. This excessive condensation greatly strengthened the claim of the provincial newspapers for admission to the reporters' gallery, for they were not only willing but desirous of furnishing to the public fuller and better reports of debates than the London papers supplied.

It only remains to say a few words respecting *Hansard's Parliamentary Debates*, the only publication since the *Mirror of Parliament* which professes to give all the speeches fully and accurately. We have already pointed out (see HANSARD) that no staff of reporters is engaged for this work, and that when members quote *Hansard*, for the purpose of convicting an opponent of inconsistency, they are fully aware they are citing from the report of some daily journal; but they take it for granted the passage has been specially brought under the notice of the speaker by the editor of that publication, and it is therefore presumed that the report is authentic. In 1878 an arrangement was made between Mr. Hansard and the government, by which he undertook to supplement his reports by others taken by reporters in his employment who should have access to the gallery. This was not thought to be sufficient by some legislators, who desired an official report of the debates, that is to say, a verbatim report of all speeches. This was one of the questions submitted to the special committee to which reference has been made, and it indicated an opinion in favor of an arrangement by which Mr. Hansard's reports should be improved without being verbatim.

The constitutional importance of good and free parliamentary reporting can scarcely be overrated. It enables the entire people to be present, and in a manner to assist in the deliberations of parliament. The English orator addresses, indeed, not only the assembly of which he is a member, but, through it, the civilized world. Publicity has become one of the most important instruments of parliamentary government. Long before a measure can be adopted by the legislature, it has been approved or condemned by the public voice; and, living and acting in public, parliament under a free representation has become as sensitive to public opinion as a barometer to atmospheric pressure. See May's *Constitutional History of England*; Knight Hunt's *Fourth Estate*; Andrews's *History of British Journalism*; papers in *Chambers's Journal* in 1834; Grant's *The Newspaper Press* (1871); also article NEWSPAPER.

In continental countries enjoying constitutional government, official shorthand writers are usually appointed by the government to report the debates, and these reports may, under certain restrictions, be transferred to the columns of the press. In the United States, particular speeches delivered in congress are fully reported and generally read; but complaints are made by members that the New York and other journals do not give sufficient space to a report of the proceedings of congress.

REPORTS, in law are printed collections of decisions rendered by courts of high jurisdiction accompanied by the main points in the arguments of the opposing counsel, the reasons which have governed the judges in coming to the decisions set forth, and where, as in many cases, there is a dissenting or minority opinion, this may also be given. The English common law differs from other systems in that it is impossible to arrange its principles in codified form. Precedents are necessarily of great value, not as positively and irrevocably establishing the law, but as expounding the application of its principles

to the points in decision. Decisions recorded in the reports may be, and often are, overruled; but they are generally considered binding on inferior courts, and are never overthrown without strong reason. It must not be supposed that all reports are of the same value or authority. They differ not only as to the grade or character of the court whose decisions they record, but also as to the ability and discrimination of the writer and his position as being or not being an official representative of the court. The early English reports, in particular, vary greatly as to their value and authority; many of the decisions previous to the revolution, and thus forming part of our own common law, are so reported as to render them absolutely worthless. It would be impossible to attempt here any comparison of the different reports, which number hundreds. The matter is ably discussed in a work by John W. Wallace, for many years reporter of the U. S. supreme court, entitled *The Reporters, Chronologically Arranged, with Occasional Remarks on their Respective Merits*. In Bouvier's *Law Dictionary* will be found a list of nearly 1000 reports, with many valuable historical and critical notes prepared by Theodore W. Dwight, LL.D. In the United States the highest reports are those of the supreme court, yet they are not binding upon state courts except in matters of constitutional law. All the states have reports of the proceedings of the supreme court, or court of last resort. These have no binding authority in other states, but are regarded with respect varying somewhat with the reputation of the judges of the court whose decisions are reported and the skill of the reporter. It has for many years been the practice of judges to write their opinions and give them to the reporters in that form. To the report of each case is prefixed a short summary of the facts and of the opinions held in the matter by the court. Reporters are now usually appointed by the court itself. So great is the number of reports that the use of digests is a necessity. There are several collections of leading cases, both American and English, such as Smith's *Leading Cases*; Wallace's *The Leading American Cases*; and White and Tudor's *Leading Cases in Equity*.

REPOUSSÉ, a French term applied to a peculiar method of ornamentation in metal-work, resembling embossing; but the effect is produced by hammering up the metal, which is generally thin, from the back, and when a rude resemblance of the figure to be produced is thus formed it is worked up by pressing and chasing the front surface. The finest specimens of this art are of the *cinque-cento* or 16th c. period, by Benvenuto Cellini. Cellini carried the art to France, where it has of late been much developed. Much common repoussé work is done in Birmingham, in the soft white metals, such as pewter and Britannia metal; and as these are easily worked, and can afterward be electroplated, so as to hide the quality of the material, they are in considerable demand. After they are hammered up from the inside, they are filled with liquid pitch, and set by until it becomes solid. Then they are modeled and chased on the surface, the pitch forming a support, which prevents the tools from pressing down more than is required. The pitch is afterward melted and drained out, and a subsequent boiling in an alkaline lye completely cleans the work. Tea and coffee pots are the chief articles made in this manner.

REPRESENTATION, in politics, the function of the delegate of a constituency in a legislative or other public assembly. The principle of representation, even where not directly recognized, must be presumed to have existed to some extent in all governments not purely democratic, in so far as the sense of the whole nation was considered to be spoken by a part, and the decisions of a part to be binding on the whole. The constitution of ecclesiastical councils, in which an express or implied representation is necessarily involved, doubtless conduced to the application of a similar principle to national assemblies; but it is in the exigences of feudalism that we trace the beginnings of an associated and regulated system of political representation. The feudal superior who had to levy aid from his vassals, summoned a limited number of them to attend him, and confer regarding the required aid. The earliest complete system of representative institutions is to be found in the parliament of the Sicilies under the Swabian kings; but Britain is the only country in which a representative feudal assembly ripened into a legislature. As early as the reign of Henry III. we find the knights of the shire elected by the "men of the country," probably the king's military tenants, to consider, in the stead of each and all of them, what aid would be granted to the king for a proposed expedition into Gascony. Representatives of the burgesses were soon afterward summoned, and were permanently ingrafted on parliament by Edward I. In Scotland representative burgesses formed a part of the national assembly from the time of Robert Bruce's famous parliament at Cambuskenneth in 1326; but down to a comparatively late period the whole barons or freeholders of the country formed part of the king's council, and were entitled to attend in person. A system of representation among them was attempted to be introduced by James I. on his return from England, but became practically inoperative; and it was not till 1587 that the representatives of the small barons came to form part of the parliament. The progress of society has led to great changes in the constitution of the elective body, the most sweeping being those introduced by the reform acts. See **PARLIAMENT**, and **REFORM, PARLIAMENTARY**.

An important question naturally arises connected with the subject of representation: Is the delegate the mere mouthpiece of his constituents, who must give effect to all their

opinions and interests, or is it his duty to exercise his trust in the first instance for the general welfare of the nation? The former idea of representation was doubtless the earlier one; but it cannot be easily vindicated on any proper theory of government; and it is now the generally recognized doctrine among English statesmen, that a member of the house of commons is bound to the entire nation by ties higher than those which bind him to his constituents, and that he ought to support such measures as he judges most beneficial to the country, even at the risk of prejudicing the immediate local interests of the body which sends him. It is therefore not very easy to reconcile with sound principles the usage which obtains so largely of demanding pledges from candidates for representation as to how they are to vote on every public question that is likely to come before them. Yet there is practically a difficulty in preventing a system of representation from becoming one of mere delegation, so long as the constitution gives to the electors the power of making their vote depend on any conditions which they may think fit to attach to it.

Most speculative politicians of the present day consider a representative government of some description as the best ideal type of government; but all repudiate the idea of an inborn right in all citizens to participate, and still more to participate equally in the right of choosing the governing body. Any very extensive suffrage must of necessity lead to the predominance of mere numbers over intelligence, while a very limited suffrage has been objected to as doing away with the benefits which the community at large are presumed to draw from a participation in public functions. Several intelligent political writers, while advocating a widely extended suffrage, have proposed a graduation of that suffrage by giving to each individual a number of votes corresponding, as far as practicable, to his intelligence, property, or social position. This is doubtless the perfect ideal of representative government, and the chief question is: By what test can the best approximate estimate of social value be arrived at? Two different schemes for this purpose have been proposed by Mr. J. S. Mill and prof. Lorimer respectively—the former founded mainly on intelligence as indicated by instruction, and the latter on wealth and social position. The attention of political writers has also lately been directed to the question of the representation of minorities, who at present are not even allowed a hearing in representative assemblies. The most feasible scheme for this purpose is perhaps that of Mr. Hare, which had the approval of Mr. J. S. Mill, by which those who do not like the local candidates, are to be allowed to fill up voting papers by a selection from the names of any persons on the list of candidates, with whose general political principles they sympathize. This system, along with its other advantages, would, it is supposed, bring into parliament numerous men of able and independent thought, who, by the present system, refrain from offering themselves, as having no chance of being chosen by the majority of any existing constituency. See J. S. Mill's *Considerations on Representative Government* (London, 1861); prof. Lorimer's *Political Progress not necessarily Democratic* (1857); and Hare's *Treatise on the Election of Representatives* (1860).

REPRESENTATION in politics (*ante*). It is one of the faults of representative government that, from the usual division of the people into two political bodies divided by strict party lines, the governing power rests in the hands, not of the whole mass of voters, but of a partisan majority. That questions purely political should be settled in this manner is perhaps free from objection; but there are many subjects of legislation in which great injustice must follow the abandoning of the rights and interests of the minority to the arbitrary decision of the majority. Thus, members of both parties are equally affected by the burdens of taxation, and both should have power in determining the amount of taxes to be laid and the application of the funds. To remedy the evils of majority tyranny, various systems of minority or proportional representation have been proposed. Two of these have been tried in this country. The "cumulative" or "free" vote is applicable in case where several officers of the same grade are to be elected. The voter is allowed to cast as many ballots as there are offices to be filled, and may concentrate or distribute them as he chooses on one or more candidates. The principle, with certain modifications, was first applied in this country to the local elections in Bloomfield, Penn., by a statute passed by the legislature of that state in 1870, and has subsequently been adopted for many other towns. The constitution of Illinois of the same year applies the method to the election of state representatives, and also to the choice of directors or managers of incorporated companies by the stockholders. In the latter particular it has been followed by the constitutions of West Virginia (1872), Pennsylvania (1873), Missouri (1875), and Nebraska (1875). The second method is known as the "limited vote," where the voter is not allowed to vote for the entire number of persons to be chosen, but must cast his votes singly for a limited number. This has been applied to the election of members at large to the constitutional conventions of New York (1867) and of Pennsylvania (1872). By the constitution of Pennsylvania of 1873, judges of the supreme court (when two or more are to be chosen for the same term), county commissioners and auditors, inspectors of election, and Philadelphia magistrates, are elected by the limited vote. By an amendment to the New York constitution it was provided that at the first election for judges of the court of appeals, each voter might vote for the chief-justice and four only of the six associates. The result was that two were elected by the minority party.

REPRIEVE (Fr. *repandre*, to take back) is the suspension of punishment for a crime, and is used chiefly in connection with capital crimes. The power of suspending all sentences at any time is vested in the crown at discretion. There are also several grounds on which the judge or a court reprieves the sentence. One is, where the judge is not satisfied with the verdict, or is doubtful of the validity of the indictment, in which case he reprieves the sentence, in order to give time for some application to the crown. Moreover, an ordinary ground of reprieve is acted on generally as a matter of course, whenever the prisoner is a pregnant woman, and pleads that fact, in which case it is considered only merciful toward the offspring to put off the execution of the sentence until after her delivery. This was the law of ancient Rome; and nothing connected with the memory of queen Mary is more detestable than the bloody proceeding in her reign of burning a pregnant woman in Guernsey, when the child, which was born at the stake, was cast into the fire as a young heretic. When a woman pleads her pregnancy as a reason for reprieve, the practice is for the judge to empanel a jury of 12 matrons, or discreet women, to inquire into the fact, and if they bring in a verdict of "quick with child," execution is stayed, as a matter of course, from session to session, until the delivery. Another cause of reprieve is the insanity of the prisoner, for if before execution it appear the prisoner is insane, whether the insanity supervened after the crime or not, the judge ought to reprieve him.

REPRISAL is the retaking, from an enemy, goods which he has seized, or the capture from him of other goods, as an equivalent for the damage he has wrought.—A *reprise* is a ship recaptured from an enemy or pirate. If recaptured within 24 hours of the hostile seizure, she must be wholly restored to her owners; if later, she becomes the lawful prize of her captors.

REPRISALS, LETTERS OF, the same as **LETTERS OF MARQUE** (q. v.).

REPRODUCTION, or the propagation of organized beings in the animal kingdom is accomplished by three different processes. The first of the three processes by which the multiplication of individuals takes place consists in the division of one organism into two, each of these, again, dividing into two others, and so on. This is termed *reproduction by fission*. The second mode of increase consists in the formation of a bud at some part of the body of the animal. This bud gradually approximates in form to that of the parent from which it springs; its pedicle or stem gradually disappears; and the liberated bud ultimately assumes a perfect form, resembling in all respects the parent from which it sprang (*gemination*). The third mode is far the most complicated. In it the new organism results from a series of changes occurring in an impregnated egg or *ovum*. For this process, distinct sexual organs, both male and female (which, however, may be associated in the same individual, although in all the higher animals they occur in distinct individuals), are required; a female organ for the production of cells termed "germs," and a male organ for the production of certain cells termed "spermatozoa." It is from the union (either within or without the body) and the mutual action of these cells—the germ and the spermatozoon—that the impregnated ovum results. The new resulting body is altogether different from either of the cells which took part in its production. This is the ordinary form of reproduction in all the higher animals, and may be termed *true generation*, in contradistinction to the previous form of *reproduction by multiplication*. The terms *digeneration* and *heterogenesis* have been applied by recent physiological writers to designate the form of reproduction in which the contact of germs and spermatozoa gives rise to fecundation; while the terms *monogenesis* and *homogenesis* have been similarly applied to the cases in which non-sexual reproduction takes place by fission or gemination.

Fissiparous multiplication is best illustrated by a reference to the infusoria. It may be either longitudinal, as commonly occurs in *vorticella*; or transverse, as occurs in *stentor*; or indifferently longitudinal or transverse, as in *chilodon paramcicum*, etc. The joints of tape-worms multiply in this manner, and when sufficiently developed become free. Among some of the annelids, or true worms, reproduction of this kind in a somewhat modified form is also observed. This was first noticed in a *nais* by the Danish naturalist Müller, by whom it was regarded as a rare and accidental occurrence. The more recent researches of De Quatrefages and Milne-Edwards have, however, shown that the process is one of far more significance than Müller supposed. In the genus *syllis*, De Quatrefages noticed the following appearances: When one of these worms is about to reproduce itself by fission, a number of rings become developed at its posterior extremity, and there is a notch or groove between the first of these rings and the part in front of it. The first ring soon becomes organized into a head provided with eyes and antennæ. The two annelids, parent and offspring, continue, however, to be united by the skin and intestine in such a manner that the latter animal lives solely upon the food swallowed by the former. During this period, each possesses independent life, for a struggle may often be observed between the two, each wishing to go its own way. After a lapse of a certain time, the body of the offspring becomes distended with ova in some cases, and with spermatozoa in others, while neither of these structures is to be seen in the body of the primary animal. Complete division is at length effected, and the offspring is free. In a few days, however, their bodies burst, from the distention caused by their contents. Ova and spermatozoa are thus diffused through the water,

and fecundation thus takes place. In the genus *myriamida* (*autolytus*, according to Grube's classification), Milne-Edwards has seen no less than six new individuals (instead of a single one, as in *syllis*), formed in gradual succession, one before the other, between the two terminal segments of the original body. Each of these new individuals, as it arrived at maturity, and acquired the external form (in reduced dimensions) of the parents, was found to be possessed of reproductive organs, of which the original animal was totally devoid. The youngest and smallest individual is the most remote from the tail.

In these instances, multiplication by division occurs as a *natural* process, but there are many cases in which *artificial* division gives rise to multiplication. Bonnet having found that a certain kind of small worm, when cut in two, reproduced a tail at the cut extremity of the cephalic half, and formed a head upon the caudal half, increased the number of sections, and finally succeeded in dividing one worm into twenty-six parts, almost all of which acquired a head and tail, and thus became distinct individuals. Corresponding results may be obtained by dividing a planaria or actinia into many segments.

Reproduction by gemmation is a phenomenon of very frequent occurrence in the lower departments of the animal kingdom. In the lowest of the animal subkingdoms, the PROTOZOA, it occurs in the *rhizopoda*—viz., in the *foraminifera*; in the *spongiae*, being probably the most common form of reproduction in sponges; and in the *infusoria*, as, for example, in *vorticella*. In the CŒLENTERATA, it is of almost general occurrence in the classes *hydrozoa* and *actinozoa*; and in the MOLLUSCOIDS it occurs in *polyzoa* and in *tunicata*. If some hydras are kept for a few days in a glass of their native water, knot-like excrescences will be seen on their bodies. These are the buds or *gemmæ*, which rapidly enlarge, and each by degrees assumes the appearance of a young hydra, tentacles appearing about the mouth; just as in the original animal. For some time, a portion of the food (minute infusoria, entomostraca, etc.), caught and digested by the parent, passes into the body of the offspring; but when the tentacles are sufficiently developed, the young polype catches food for itself, and when it is sufficiently matured to commence an independent existence, the connecting pedicle gives way, and the young animal is free and independent.

It must be distinctly understood, that the fact of an organism reproducing itself by fission or gemmation does not by any means exclude the possibility that it may also be reproduced by fecundated ova. That this is the case, is indeed shown in the instance of the worm *myriamida*, and a very large number of corroborative cases might be readily given.

In *true generation*, two special organs are required—a female organ for producing the germ-cell or ovum, and a male organ for producing the sperm-cell or spermatozoon; and each form of generative apparatus consists of two parts, of which one is a formative organ—in the female, termed an *ovarium*, or ovary, and in the male, a *testis*—in which the reproductive cells are formed, and which is essential; and an efferent duct, by which the products of secretion are carried off. The male and female organs may exist in separate individuals, or they may co-exist in the same individual, giving rise to the condition known as *hermaphroditism* (q.v.). The former condition is termed *bisexual* or *diocious*, and the latter *unisexual* or *monœcious*. For a general description of the changes which take place in the impregnated egg, the reader is referred to the article DEVELOPMENT OF THE EMBRYO.

We shall conclude with a brief notice of the mode or modes of reproduction in the different classes of animals, beginning with the lowest.

In the subkingdom PROTOZOA, reproduction takes place by all three modes, viz., by fission, gemmation, and impregnated ova; but fission is here the predominating form; and it is only in the infusoria that there is undoubted evidence of true generation by ova and spermatozoa. It is worthy of notice, that in the infusoria, propagation is effected in no less than four different ways—viz., by the three processes already described in this article, and by a process known as "encystation." See INFUSORIA.

In the subkingdom CŒLENTERATA, it is found that both the hydrozoa and the anthozoa multiply by gemmation, by a true reproductive process, and in a few genera by fission.

In the ECHINODERMATA, fission has been observed in one class, the holothuroidea, which, moreover, have distinct sexual organs combined in the same individual. In the other classes—the echinoidea, asteroidea, and crinoidea—the sexes are separate, and generation only takes place by the union of germs or ova and spermatozoa.

In the ANNELIDA, true generation takes place, although, as has been already shown, multiplication sometimes takes place by fission. In the lower *mollusca* or *molluscoids*, multiplication takes place by gemmation and by true generation; whilst in the higher *mollusca*, multiplication only takes place by true generation.

In the ARTICULATA—insects, crustaceans, etc.—distinct generative organs are always present, and, excepting in one class of crustaceans—the cirrhopoda—the sexes are distinct.

In the VERTEBRATA, we meet with the highest and most complex development of the generative function. In them, with a doubtful exception in the case of one or two genera of fishes, the sexes are always distinct.

The *osseous* and *cartilaginous* fishes present important differences in their reproductive organs and in their modes of reproduction. In the *osseous* fishes, the essential female organ—the ovary, or ooc—consists of a large membranous bag, usually in two lobes, but sometimes single. When distended with ova, this organ fills the greater part of the abdominal cavity, and its lining membrane is arranged in folds, wherein the ova are formed and retained until sufficiently ripe for expulsion. They then escape into the ovarian cavity, and are expelled in almost incredible numbers through a special opening immediately behind the anus and in front of the urinary canal. As a general rule, the ova of fishes are impregnated after their expulsion; and in order that the impregnation of a sufficient number of eggs may be secured, the male secretion of fishes—the fluid containing the spermatozoa—is very abundant; the male secreting gland, which in fishes is termed “the milt” or “soft roe,” being equal in bulk to the ovary of the female. In a few instances, however, the young are hatched in the ovary, and grow to a considerable size before they are born, and in these cases—as, for example, in the viviparous blenny—impregnation must take place internally. In the *cartilaginous* fishes—the sharks and rays—the generative organs are of a higher type. The eggs are always impregnated within the body of the female, the male having special organs by which true sexual congress is effected, and the ovaries form two large racemous bunches, placed on either side of the spine. The eggs are large in size, and comparatively small in number; and as each egg escapes from the ovary, it is seized by a true oviduct, which furnishes it with additional protective coverings. About the middle of this tube “there is a thick glandular mass, destined to secrete a horny shell, in which the yolk and white of the egg become incased. The egg, when completed, has somewhat the shape of a pillow-case, with the four corners lengthened out into long tendril-like cords, whereby the egg is entangled among the sea-weed at the bottom of the ocean. A brittle egg-shell would soon be destroyed by the beating of the waves; hence the necessity for the corneous nature of the envelope; and yet how is the feeble embryo to escape from such a tough and leather-like cradle? This has likewise been provided for. The egg remains permanently open at one extremity; the slightest pressure from within, therefore, separates the valvular lips of the opening, and no sooner has the little shark thus extricated itself from its confinement, than the two sides close so accurately that the fissure is imperceptible.”—R. Jones’s *General Outline of the Animal Kingdom*, 1841, p. 534.

In the *amphibia* or *batrachia*, the sexes are more closely associated than in the *osseous* fishes, the ova being generally impregnated by the male as they escape from the abdominal cavity of the female. The mode of reproduction of one amphibian, the Surinam toad, is remarkable and anomalous. See PIPA.

In the true *reptiles*, the male sexual organs become more perfect, instruments being given to facilitate the impregnation of the female during that congress of the sexes which now becomes essential to fecundation.

In *birds*, the generative organs present a close analogy to those of the higher reptiles. There is only a single ovary (the left) that has a bunch-like or racemous appearance; the right, with its oviduct, being always atrophied or rudimentary—a remarkable violation of symmetry, resembling that which occurs in the lungs of serpents. As prolonged uterogestation would be incompatible with flight, incubation here attains its highest perfection.

In *mammals*, a new organ for the first time appears, from which that important class derives its name. In most of them (see MAMMALIA and PLACENTA), a temporary organ, termed the placenta, is also formed, by which the fetus is nourished during uterine existence.

For further details on the subject of this article, the reader is referred to De Quatrefages’s *Rambles of a Naturalist*, and to his *Metamorphoses of Man and the Lower Animals*; Dr. Allen Thomson’s article “Ovum” in the *Cyclopadia of Anatomy and Physiology*; Dr. Carpenter’s *Comparative Physiology*; and to Kölliker’s *Entwickelungsgeschichte des Menschen und der höheren Thiere*.

REPRODUCTION IN PLANTS. See PLANT, VEGETABLE PHYSIOLOGY, and FECUNDATION.

REPTILES (Lat. *repto*, I creep), constitute a class of the subkingdom *vertebrata*, lying between the classes of amphibians and birds. They may be briefly characterized as being cold-blooded, having a heart composed of only three cavities—viz., two auricles and a single ventricle, and as breathing by lungs throughout the whole period of their existence; in which respect they differ from the amphibians, which some zoologists associate with them, and which, in the early part of their existence, are furnished with gills for aquatic respiration. They are divided into the following orders: 1. *Ophidia*, or serpents; 2. *Sauria*, or lizards; 3. *Loricata*, or crocodiles; and 4. *Chelonia*, or tortoises; so that in so far as external form is concerned, the members of this class present a far greater diversity than is observed amongst the members of the other classes of vertebrates.

With the exception of the tortoises, the reptiles in general are of an elongated form, the body being often nearly cylindrical, and usually terminating in a very long tail. In a considerable number (as the serpents and some of the lizards) no traces of limbs are apparent; in some (as certain lizards), the limbs are rudimentary; while in the remainder

the limbs are fully developed, although not to the extent to which development takes place in birds or quadrupeds, as the feet rarely suffice to keep the belly from the ground. The outer covering of the body presents several well-marked varieties. In a few of the lizards, the skin is covered with regular scales, composed of a mixture of bony and horny matter, and lying over each other like those of fishes; in most lizards and in serpents, there are scales and plates developed on the surface of the corium or true skin, and covered over with epidermis, which is thrown off at intervals, the moult forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are imbedded in the tissue of the skin, and in the latter are united with the ribs, sternum, etc., of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can be retracted.

The skeleton is completely ossified in all reptiles, and presents many points of interest to the philosophical anatomist, into which we have not space to enter. In the skeleton of the crocodiles and lizards, there is an obvious distinction of the regions of the neck, trunk, and tail. The total number of vertebræ is often great, but it is chiefly in the caudal region that the excess occurs; there being 36 caudal vertebræ in the crocodile, and 115 in the monster lizard. In the serpents, the vertebral column is more abundantly subdivided than in any other animal; the number of vertebræ in the python being 422, of which about six-sevenths possess ribs articulated to their bodies by a ball-and-socket joint. By the motion which is thus allowed to the ribs, they become in some degree instruments of progression. In the reptiles generally (excepting the tortoises), one surface of each centrum (or body) of the vertebræ is concave and the other convex; while in the tortoises these surfaces are flat. The true skull is small, the bulk of the head being made up by the jawbones. As the sutures separating the individual bones never become obliterated, the reptilian skull is well adapted to illustrate the true structure of the vertebral skeleton. In Fig. 1 we have the skull of the crocodile.

1 is the principal frontal, divided in the serpent into two parts; 2, 2, are the anterior and 4, 4 the posterior frontals; 7 is the parietal bone, which is usually single in reptiles, 12, 12 are the mastoid bones (homologous to the mastoid process in man); 17, 17 are the intermaxillaries; 18, 18 are the maxillaries; 20, 20 are the nasals; 23 is the temporal bone (corresponding to the squamous portion of the human bone); 34, 35, 36, 37, are the dental, the articular, the angular, and the opercular portions of the inferior maxilla, or lower jaw; a is the tympanic bone, which supports the drum of the ear; b is the zygomatic or malar bone; and c, c the lachrymals. The lower jaw (except in the tortoises) presents the peculiarity of being composed of a number of separate pieces; there being four or five in each half-jaw in serpents, while in crocodiles and lizards each half is divided into at least five, and generally six pieces, which are united by suture. The four most important of these are shown in Fig. 1. The purpose of this arrangement is probably (as Dr. Buckland suggested in his *Bridgewater Treatise*) to diminish the risk of fracture, which would otherwise attend the snapping together of their elongated jaws.

FIG. No. 1.—Skull of Crocodile.

The bones of the extremities, except in the serpents, which have no limbs, correspond with those occurring in the higher vertebrata.

The mouth, except in the chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey, than for dividing and masticating food. These teeth, like those of fishes, are successional; that is to say, new teeth are being constantly developed, whilst the older ones are regularly shed. In the crocodiles, three, or even four generations of teeth, sheathed one within the other, may often be seen in the same socket.

In some instances, the teeth are attached solely to the jaws, while in others they are also attached to the pterygoid or palate bones. In chelonians, the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting, and which in some species constitutes a somewhat formidable weapon.

The digestive organs present less marked differences than the osseous system. With the exception of certain chelonians, all reptiles are carnivorous, and swallow their prey whole. Hence the jaws are adapted, by their mobility and subdivision into segments, to open very widely, and the œsophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable, whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the œsophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case, it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former glands pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The anal aperture of this

cloaca is *transverse* in serpents and lizards, and *longitudinal* in crocodiles and tortoises. These peculiarities in the anal aperture are accompanied by remarkable differences in the external generative organs of the male, and seem to divide the class into two great sections.

It is in their circulating and respiratory organs that reptiles present the most marked characteristics. Like birds and mammals they breathe air, but like fishes, they are cold-blooded. The reason why they are unable to sustain a fixed temperature above and independent of that of the surrounding medium, is due partly to the arrangement of the blood-vessels (see CIRCULATION), and partly to the structure of the lungs. The lungs are usually of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air-cells, the real aerating surface is comparatively small. In several orders, they are merely capacious bags, whose vascular or aerating surface is but slightly increased by sacculi developed in their cells. In serpents, the pulmonary arrangement is singular, one lung (usually the right one) being of extraordinary length, while the other remains altogether rudimentary. It is in the tortoises and crocodiles that the lung is most highly developed. This inferiority of the respiratory apparatus of reptiles is further shown in the absence of those means for the continuous introduction and expulsion of air which are observed in birds, and still more in mammals, and which are described in the article RESPIRATION.

The cerebral portion of the *nervous* system in many respects resembles that of fishes, but the cerebral hemispheres are larger in proportion to the optic lobes, while the cerebellum is usually smaller. The organs of the senses are better developed than in fishes. The eye is always present in reptiles, and presents no remarkable peculiarity. We here first meet with a special arrangement for the protection of this delicate organ; "for while in serpents the skin of the head passes continuously in front of the eyes, merely becoming transparent where it covers the cornea, it is doubled in most other reptiles into two folds, constituting the upper and lower eyelids, which can be drawn together by a sphincter muscle; and we also find a rudiment of a third eyelid, formed by an additional fold of membrane at the inner angle, which is so completely developed in crocodiles as to form a nictitating membrane, that can be drawn completely across the eye as in birds, by a muscle specially adapted for that purpose."—Carpenter's *General and Comparative Physiology*, 3d ed. p. 495. The organ of hearing is more highly developed than in fishes or amphibia. There is no external auditory canal, the membrane of the tympanum being covered externally by the integument of the head. The senses of taste and touch are probably obtuse in most animals of this class, and from its structure, the tongue is probably rather an organ of touch than of true taste.

All reptiles are *oviparous* animals. Certain species, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term *ovo-viviparous* is applied. The eggs are relatively large, and are furnished with a very large yolk, for the nutrition of the young animal. They are inclosed in a parchment-like shell, which contains very little calcareous matter. They are usually deposited in warm sandy places, well exposed to the sun, or in dughills, in which the heat induced by the putrefactive process facilitates the final stage of embryonic development. Lizards lay from 8 to 12 eggs, serpents from 10 to 50, tortoises from 20 to 26, and crocodiles from 20 to 60. In this respect they differ widely from the amphibia, some of which lay as many as 1200 eggs. The common opinion that, after the expulsion of the eggs, the reptiles take no further care of their progeny, is erroneous. Crocodiles and lizards have been observed to watch the places which they have chosen as their nest; and the pythons (at all events, when in captivity) coil themselves around their eggs, and keep up a temperature very considerably above that of the surrounding medium. The sexes are always separate; and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoologists as a basis of classification.

In relation to their *habitat*, it may be observed that most of the tortoises and certain serpents are essentially aquatic animals (some inhabiting fresh, and some salt water), which rarely seek the land except for the purpose of laying their eggs. Serpents, however, as a general rule, affect moist places in the neighborhood of water, although some are inhabitants of dry sandy deserts. Lizards for the most part frequent the sandy districts of hot and tropical regions, and either burrow in the ground or live in holes in trees, walls, etc. Reptiles generally predominate in the warmer regions of the globe, in which alone the largest kinds are to be found. In the northern countries, comparatively few species are found, and these pass a great portion of the year in a state of hibernation (q.v.) or torpidity. Dr. Carpenter puts down 2,000 as about the probable number of existing species of reptiles. Schinz states that in Europe there are 7 tortoises, 33 serpents, and 35 lizards. The most complete treatise on the natural history of reptiles is that of M. M. Dumeril and Bidron, in 9 volumes; it is entitled *Erpétologie Générale, ou Hist. Nat. Complète des Reptiles* (Paris, 1834-54).

REPUBLIC (Lat. *res publica*, the public good), a political community in which the sovereign power is lodged, not in a hereditary chief, but either in certain privileged

members of the community, or in the whole community. According to the constitution of the governing body, a republic may therefore vary from the most exclusive oligarchy to a pure democracy. The several republics of Greece, and that of Rome were, at the outset at least, aristocratic communities. The mediæval republics of Venice, Genoa, and the other Italian towns were also more or less aristocratic. The sovereign power was held to be vested in the franchised citizens, and every function—legislative, executive, or judicial—not exercised directly by that body, could only be exercised by parties deriving their authority from it. But the extent of the franchise, and the mode of exercising it, varied much in these civic communities; and the most prosperous and long-lived was Venice, which was also the most aristocratic of them all. In the 16th c., the seven provinces of the Netherlands, on their revolt from Spain, adopted a republican form of government, as did Switzerland on becoming independent of the German empire. Great Britain was nominally a republic for eleven years (from 1649 to 1660). France was a republic from 1793 to 1805, and from 1848 to 1853; and the republic was again proclaimed Sept. 4, 1870. Such government as Spain had between Feb., 1873, and Dec. 31, 1874, was of a republican form. Switzerland is also a republic; since 1848 more democratic than formerly. The other republics of Europe are the diminutive states of San Marino and Andorra; and, in certain respects, the free cities of Hamburg, Bremen, and Lübeck. The most important of modern republics is that of the United States of America—dating from its separation from Great Britain—where pure democracy has been tried on a scale unknown elsewhere. Except during the short-lived empire from 1863–67, Mexico has been a republic since 1824. Nine republics at present exist in South America—Peru, Chili, Paraguay, Bolivia, Colombia or New Granada, Venezuela, Ecuador, Uruguay, and the Argentine Confederation. In the republics of the ancient world, the franchised classes exercised their power directly without any system of delegation or representation. The same was at first the case in the Swiss cantons, where, however, representative government has been gradually introduced. Modern republics have been founded on the representative, not the direct, system, which can hardly exist except in a community that is very small and concentrated as to space. Switzerland and the United States of America are *federal* republics, consisting of a number of separate states bound together by a treaty, so as to present to the external world the appearance of one state with a central government, which has the power of enacting laws and issuing orders which are directly binding on the individual citizens.

REPUBLIC, a co. in n. Kansas, adjoining Nebraska; drained by the Republican river; about 725 sq. m.; pop. '80, 14,913—12,657 of American birth. The surface is rolling, with an extensive growth of timber. The soil is fertile. The principal productions are corn, wheat, and live stock. Co. seat, Belleville.

REPUBLICAN, a party name in American politics, which has had at different times different significations. At the adoption of the federal constitution in 1787, and while its ratification by the several states was under discussion, the country was divided into two parties—the federalists, headed by Washington and the elder Adams; and the anti-federalists (who afterward took the name of republicans), under the lead of Jefferson and Madison. The federalists were in favor of a strong centralized government; the republicans advocated the sovereignty of the states and the rights of the people; and finally secured those amendments and additions to the constitution which were intended to guarantee state rights, and which declared that all powers not expressly granted to congress by the constitution are retained by the states or the people. During the French revolution and the wars which succeeded it, the federal party sympathized with England, while the republicans favored the French, and being in power, under the presidency of Mr. Madison, declared war against England in 1812, a measure which the federalists violently opposed, going so far in the Hartford convention as to threaten a dissolution of the union. During the political excitements of this period, when the excesses of the French revolution had thrown a certain degree of odium upon its supporters, the republicans were stigmatized by their opponents as democrats. The name, given as a reproach, was soon adopted; and the party of Jefferson and Jackson called itself democratic republican, and its members were usually called democrats; while the name of federalist having become unpopular by the opposition of the party to the war with England, it adopted the designation of national republicans, and some years later, of whigs, which was the name taken by the "disloyal" party in the war of independence, the "loyal" party being called tories. The whigs of 1840 repudiated alike the principles and name of the federalists; they professed to be followers of Jefferson, and called themselves democratic whigs.

In the effort to elect Mr. Fremont in 1856, and in the election of Mr. Lincoln in 1860, the whig party, deserted by many of its more conservative members, known as old whigs, but re-enforced by a larger number of free-soil democrats and abolitionists, adopted the name of republicans, and were called by their opponents black republicans, from their anti-slavery tendencies. In the presidential contest of 1864, the republicans, hoping to secure the support of the war or union democrats, adopted the name of the "union party," while they went further than the ancient federalists in support of a strong centralized government. The federalist, national republican, whig, and republican party has been essentially the same, and for the most part a New England or north-

ern party—its principal leaders having been John Adams, Josiah Quincy, Alex. Hamilton, Daniel Webster, Henry Clay, Wm. H. Seward, Abraham Lincoln, and Ulysses Grant. The democratic party has its centers in Virginia and New York, and was the party of Jefferson, Madison, Jackson, Calhoun, Van Buren, Polk, Pierce, Buchanan. The former party advocated a construction of the constitution favorable to the powers of the federal government, a national bank, and a high protective tariff; the democratic party, on the other hand, held to a strict construction of the constitution, a careful limitation of the powers of the central government, an independent treasury, a specie currency, and free-trade, or a tariff for revenue only. There was, 30 years ago, a respectable whig minority in most of the southern states, and in two or three, whig majorities; but when the whig party adopted abolition, and took the name republican, every southern state voted with the democratic party. Since the civil war, the people of the southern states have been still more closely attached to the democrats.—Other party names met with in American political writings are of a local, factional, or temporary character. "Blue-light federalist" was a name given to those who were believed to have made friendly signals to British ships in the war of 1812. "Barn-burner" was applied as a term of reproach to a section of the democracy supposed to be in sympathy with the "anti-renters." The "soft shells" were "free-soil" democrats, in favor of excluding slavery from the territories and future states of the union; while the "hard shells" were in favor of what they held to be the rights of the south. The more widely-known name of "locofoco," applied to, and good-naturedly accepted by the democratic party, arose from the fact, that a meeting of a section of the party in Tammany hall, its New York headquarters, having been deprived of light by the turning off of the gas, at the order of the party managers, lighted up the hall with candles, by the aid of lucifer or loco-foco matches, and so passed its resolutions. "Copperhead," the name of a venomous serpent, was applied to the peace party by the advocates of the war for the union.

REPULSION, like caloric, luminous corpuscles, and other crude hypotheses of mediæval times appears to be doomed to speedy extinction. The apparent repulsion between the particles of a gas, in virtue of which it exerts pressure on the containing vessel, is now known to be due to motion (see HEAT). A wet cork and an oiled one, floating on water, repel each other—a phenomenon fully accounted for by capillary attraction; as is that of the apparent repulsion of mercury by glass, which is shown to be due to the fact, that mercury attracts itself more than it attracts glass. No one now believes that a balloon rises while a stone falls because the former is repelled, and the latter attracted, by the earth. The last is a very good example, because it clearly shows how apparent repulsion may be the result of attraction. The earth attracts the balloon less than it attracts an equal bulk of the medium (air) in which it floats; and, consequently, the pressure of the air on the balloon is more than sufficient to support its weight. The moon raises tides not only on the side of the earth nearest her, but also on that furthest from her. No one imagines that she attracts the nearer water, and repels the further. We know that she attracts the nearer water more, and the further less, than she attracts the earth; and that the apparent repulsion is thus merely a difference of attractions.

It is not quite so clear how we are to account generally for repulsion in electricity (q. v.), magnetism (q. v.), and electro-magnetism (q. v.), though many of these phenomena are known (especially by the beautiful experimental researches of Faraday) to bear explanations precisely analogous to that of the balloon above alluded to. There are also very curious problems, apparently involving repulsion, connected with the behavior of the tails of comets. But it is reasonable to suppose that, in all probability, we shall soon be able to account for all these phenomena by simple differences of attraction on the body influenced and the medium which surrounds it. Our real difficulty will thus be reduced to the explanation of attraction itself, which promises to be a problem of a far higher order of complexity. For an account of some of the modern speculations on this subject, see FORCE.

REPUTE, in Scotch law, is used sometimes as a technical term, which it is not in English law. Thus, a habit and repute thief is one who, as a matter of fact, is notoriously a thief. So habit and repute marriage is a marriage constituted between parties who have notoriously lived as man and wife, and are supposed by neighbors and friends to be married, though there never was a regular marriage.

REPUTED OWNERSHIP is a phrase used in the English bankruptcy law to denote that the bankrupt at the time of his bankruptcy was apparently the owner of goods in his possession. The general rule is, that whatever belonged to the bankrupt at that date goes to his assignees in bankruptcy, for the purposes of sale, and distribution of the proceeds among his creditors. But as a trader often has the goods of others in his possession with their consent, and thus has the appearance of a greater capital or stock than he possesses, and thereby obtains greater credit than he would otherwise do, it is provided by the bankrupt act that if the bankrupt at the date of his bankruptcy shall, with the consent of the true owner, have in his possession, order, or disposition any goods or chattels whereof he was the reputed owner, or whereof he had taken upon him the sale, alteration, or disposition as owner, the bankruptcy court shall have power to order the same to be sold and disposed of for the benefit of the creditors under the bankruptcy.

The object of this is to prevent deceit by a trader from the apparent possession of property to which he is not entitled; as it makes the real owners of goods who intrust them to a trader, careful, that they run the risk of the goods being seized for the general benefit of the creditors. Where, however, the articles in possession of the bankrupt are of that peculiar description that they are naturally calculated to excite an inquiry on the part of creditors as to whose they are, it is otherwise. Thus, pictures deposited with a bankrupt to take charge of, as they do not lead to any erroneous belief on the part of persons dealing with him, so they do not fall to be sold and divided as part of his assets. A similar doctrine exists in Scotland by the common law, and is therefore applied to other cases than bankruptcy. By the mercantile amendment act, 19 and 20 Vict. c. 60, s. 1, in order to assimilate the law to that of England, it was declared that goods sold, but not delivered, shall not be attachable by the creditors of the seller, to the effect of preventing the purchaser or others from enforcing delivery of the same, and the right of the purchaser to demand delivery of such goods from and after the date of the sale, shall be attachable by the creditors of the purchaser.

REQUEÑA, a t. of Spain, in the modern province of Cuença, and about 80 m. s.e. of the town of that name. It contains an industrious population, amounting to 10,500, who are employed in the manufacture of woolen, cotton, and silk fabrics.

REQUESTS, COURT OF, an ancient court of equity in England, inferior to the court of chancery, and presided over by the lord privy seal. It was abolished by 16 and 17 Char. I., c. 10. Also a local tribunal (known likewise by the name of court of conscience) instituted in London by Henry VIII. for the recovery of small debts, with jurisdiction between citizens and freemen in questions of debt or damage under 40s., afterward extended to questions under £5. Similar local tribunals were instituted by act of parliament in other parts of the kingdom; but they have all been superseded by the county courts.

REQUIEM (Lat. *requies*, rest), a dirge or solemn service for the dead in the Roman Catholic church. It consists in the celebration of the mass *pro fidelibus defunctis* (for the faithful departed), the first words of the introit of which are *requiem eternam*.

REQUISITION, in international law, besides meaning the demand made by the authorities of one nation or state upon those of another for the rendering up (or extradition) of an alleged criminal, is used also in the rules of war as nearly synonymous with the word "contribution." The distinction made is that a requisition is a demand upon the people of an invaded country to furnish such things as provisions, forage, transportation, or even labor; while a contribution is a payment in money to provide for the needs of the military or civil government established. The former term, however, is generally used to cover all demands upon the people of the conquered country. It is now well settled that the rights of private citizens should be respected and their property secured from pillage. It is the rule of most civilized nations that supplies or labor demanded should be paid for after the war, and receipts given at the time. This is the principle laid down in the *Instructions for the Armies of the United States in the Field*. It was formerly the practice to inflict severe requisitions in the way of fines on an offending district or town as a penalty. It is now generally agreed that such measures are rarely justifiable and are of little practical benefit to those who employ them.

REREDOS (Fr., behind the back), the wall at the back of an altar, seat, large fireplace, etc. In churches, the reredos is usually in the form of a screen detached from the east wall, and is invariably ornamented with niches, statues, etc., or with paintings or tapestry. Very fine examples exist at Durham, St. Albans, etc.

RESACA DE LA PALMA, BATTLE OF, May 9, 1846, between 6,000 Mexican troops under gen. Arista, and 2,000 Americans under gen. Taylor, ending after a short engagement in the defeat of the Mexicans. The ravine in which it occurred, covered by a thick growth of palm trees, is in Cameron co., Texas, 4 m. n. of Brownsville, and 3 m. n. of Matamoras, on the road from Point Isabel to Brownsville.

RESCRIPTS (Lat. *rescripta*), answers of the popes and emperors to questions in jurisprudence officially propounded to them. *Rescripta principis* were one of the authoritative sources of the civil law, and consisted of the answers of the emperor to those who consulted him, either as public functionaries or as individuals, on questions of law. They were often applied for by private persons, more especially women and soldiers, to solve their doubts or grant them privileges. The rescripts directed to corporate and municipal bodies were known as *pragmaticæ sanctiones*, a name which has found its way into the public law of Europe. See **PRAGMATIC SANCTION**. Rescripts might gradually come to have the force of law, in so far as their determinations in particular cases were of general application.

RESCUE, in English law, is the illegal delivery and discharge of a prisoner or of goods out of the custody of the law. If, for example, a tenant whose goods are distrained for rent, take them by force from the bailiff, the distrainer has a right of action against a tenant or person who rescues the goods. When a prisoner is in custody for felony, and is rescued, the rescuer commits a felony. So the rescue of a prisoner for

debt is an indictable offense, punishable by imprisonment for life, and forfeiture of lands and goods.

RESECTION or **EXCISION OF JOINTS** is an operation in which the diseased bone of a joint is cut out, in place of cutting off the whole limb. Dr. Druitt, in his able summary on this subject in *The Surgeon's Vade-Mecum*, remarks, that "it seems to be established that excision is on the whole safer than amputation; less violence is done to the body, fewer great arteries and nerves are injured, and, what is of more consequence, fewer large veins are divided, and as the articular end of the bone only is sawn off, and the medullary canal not touched, there is less chance of pyæmia. Lastly, the patient is left with an imperfect limb, it is true, but with one which, in most cases, is highly useful." The operation has been performed on the ankle-joint, the elbow, hip-joint, knee, and shoulder. Few subjects have in recent times excited more discussion among surgeons than the application of this operation to the knee-joint. The operation was first performed in 1763; and up to the year 1830, there are records of 19 cases out of which 11 died. From 1830 to 1850, the operation was never performed, and was generally condemned; but in the last-named year, it was revived by prof. Fergusson, and is now a frequent and regularly recognized operation. "The cases," says Dr. Druitt, "in which it ought to be performed, are, generally speaking, such cases of injury or disease as would otherwise be submitted to amputation. The *object* of the operation is to produce a firm and useful limb, slightly shortened, and with entire bony union or fibrous union, admitting of some small degree of motion at the situation of the joint. But all cases are not suitable for excision; and those cases are unsuitable and better adapted for amputation in which either the *quantity* of the diseased bone is very great (for then the case will probably not do well, or, if it proceed to recovery, and the patient be young, the future growth of the limb will be prevented), or the *quality* of the disease may be such as experience has shown to be incompatible with the exudation of healthy material of repair." In at least 50 per cent, the operation results in a good useful leg. It has already saved so many limbs that it must be regarded as one of the greatest triumphs of modern surgery.—Further information on this subject may be found in prof. Fergusson's *Lectures on Conservative Surgery*, delivered in 1864, at the royal college of surgeons, and reports in *The Lancet*.

RESEDA CÆE, a natural order of exogenous plants, mostly herbaceous; having alternate leaves: terminal spikes of hermaphrodite irregular flowers; the calyx of 4 to 7 unequal segments; the corolla of 4 to 7 petals, alternate with the segments of the calyx, the lower petals entire, the upper much cut; the stamens 10 to 30, inserted on a fleshy receptacle; the germen free, one-celled; the fruit a many-seeded capsule, three-horned, and often open at the apex, so as to expose the seeds, which are kidney-shaped. There are about forty known species, mostly natives of Europe and the w. of Asia, and mostly mere weeds. Weld (q.v.) and mignonette (q.v.) are the species most worthy of notice.

RESERVATION is a term used in lease and also in grants of a less estate than the fee-simple. Thus, if A, the owner in fee-simple of real estate, grant a lease to B, a third party, he does not give away his whole interest, but merely part of it, and that part not given away is said to be reserved or excepted. The word reservation is, however, chiefly used in reference to rent, it being said that a landlord, on letting his land, reserves to himself a rent out of the premises, and he has certain well-known remedies for the recovery of such rent (q.v.).

RESERVATION, MENTAL (Lat. *reservatio* or *restrictio mentalis*), the act of reserving or holding back some word or clause which is necessary to convey fully the meaning really intended by the speaker. It differs from equivocation (Lat. *equivocatio* or *ambiguitas*) in this, that in the latter the words employed, although doubtful, and perhaps not fitted naturally to convey the real meaning of the speaker, are yet, absolutely speaking, and without the addition of any further word or clause, susceptible of that meaning. Thus, an example of equivocation would be: "I did not write this libel," meaning "I did not perform the mechanical operation of *writing it with a pen*," although I had really *composed* and issued it. A mental reservation might be involved in the same words, if one were to say: "I did not write this libel," mentally withholding the word "to-day," although he had written it "yesterday," or on some earlier day. Few questions in casuistry have excited more controversy, or have been the subject of fiercer recrimination, than that of the lawfulness of equivocation and mental reservation. In the celebrated *Letters* of Pascal (q.v.) against the Jesuits it was one of the most prominent, and, used as he employed it, the most effective topics; and Pascal's charges against the Jesuit casuistry of that day have been repeated in almost every popular controversy on the subject which has since arisen. There are several varieties of mental reservation, differing from each other, and all differing from equivocation under its several forms. But as regards the morality of the subject, all the forms of language calculated to deceive may be classed together, and may be treated according to the same common principles. Mental reservation is of two kinds, *purely mental* and *not purely mental*. By the former designation is meant a mental reservation which cannot be detected, whether in the words themselves or in the circumstances in which they are spoken. Of this kind would be the mental reservation implied if a person, on being asked if he had

seen A. B. (whom he really had just seen *walking* by), were to reply: "I have not seen him," meaning "*riding on horseback*." A "not purely mental" reservation is that which, although not naturally implied or contained in the words, may, nevertheless, be inferred or suspected, either from them or the circumstances in which they are used. Of this kind would be the mental reservation of a servant, in giving the ordinary answer to a visitor's inquiry for his master: "Not at home," although his master were really in the house; or that of a confessor, who, in a country where the privileges of the secret of the confessional are known and admitted, on being asked whether a certain person had committed a crime, which the confessor knew from his confession that he had committed, should answer: "I do not know," meaning "outside of the confessional." And, in general, all such doubtful forms, whether of mental reservation or of equivocation, may be divided into *discoverable* and *undiscoverable*. Much, although certainly not all the odium which has been excited against the casuists for their teaching on this head, has arisen from the confusion of their views as to these two classes of mental reservation; and the witty ingenuity with which Pascal mixed up examples of both, and applied to one what was really said of the other, did far more to damage the theological reputation of his adversaries, as a school, than any of the genuine really objectionable decisions which he cited from the writings of individual divines. Mental reservation has formed a subject of discussion for Protestant as well as Catholic divines; but without entering into a detailed history of this curious branch of casuistry, we shall content ourselves with stating briefly the chief principles on which the decisions of the most approved writers, especially of the Roman Catholic school, are founded.

First, "purely mental" reservations, and "absolutely undiscoverable" equivocations are held to be in all cases unlawful, such forms of speech being, in truth, lies; inasmuch as they have but one real sense, which is not the sense intended by the person who uses them, and hence can only serve to deceive. This doctrine is held by all sound Catholic casuists, and the contradictory doctrine is expressly condemned by pope Innocent XI. (Propp. 26, 27). On the contrary, mental reservations "not purely mental," and "discoverable" equivocations, are held to be not inconsistent with truth, and, in certain circumstances, when there is necessity or weighty reason for resorting to them, allowable. For the absolute admissibility of the expedient of mental reservation and of equivocation in such circumstances, casuists allege scriptural precedent from Genesis xx. 12, Matt. xi. 14, Acts xxiii. 6, and other passages; and the principles on which their use, in such case, is defended, are (1) that there is supposed to be in the circumstances justification, and even necessity, for not making known the whole truth; and (2) that the mental reservation in the case supposed does not amount to more than a mere *withholding the entire truth*, inasmuch as what is stated is absolutely true, and the real meaning of the speaker is absolutely *contained in it, and discoverable from it*; and the false construction put upon it by the hearer, although permitted through necessity or grave reason by the speaker, is not *positively* put forward by him. A historical example of such equivocation or reservation is in the well-known answer of St. Athanasius to the question of the party who were in pursuit of him, and who, overtaking him, but not knowing his person, asked what way Athanasius had gone. "*He is not far off*," replied Athanasius, and the party passed on in pursuit. A less easily discoverable equivocation is ascribed to St. Francis of Assisi, who, when a gang of robbers in pursuit of a traveler asked him whether he had seen the traveler pass by, put his hand up the sleeve of his habit, and replied: "He did not pass *this way*," meaning "up his sleeve." And an ordinary example of discoverable mental reservation is that of a person who, on being asked by one to whom he could not with safety give a refusal, whether he has any money, should reply: "No," meaning "none to lend you." In order, however, to justify the use of these devices of speech, casuists require that there shall be some grave and urgent reason on the speaker's part; as, for example, the necessity of keeping a state secret, or a secret of the confessional, or of a professional character, or even the confidence intrusted by a friend, or the ordinary and fitting privacy which is required for the comfort and security of domestic life, and of the peaceful intercourse of society; and that the concealed sense of the form of speech employed, although it may be *actually undiscovered*, and even unlikely to be discovered, may yet be, in all the circumstances, *really discoverable*. On these two leading theoretical principles the majority of casuists are agreed. But a wide field for practical discussion lies between them, in the variety of senses which may be attached to the phrases "not purely mental" and "discoverable;" and it is in the practical interpretation of these terms that some of the casuists have found scope for the introduction of the lax decisions which have brought odium upon casuistry. Much of this odium has fallen upon the society of the Jesuits to such a degree that their name has been popularly associated with the worst forms of the practice of mental reservation. See JESUITS and PASCAL.—See Scavini, *Theologia Moralis*, ii. 23; Murray, *Theological Essays*, iv. 274, and foll.

RESERVATIONS, INDIAN. Besides the Indian territory (q.v.), large tracts of land have been reserved for the use of certain tribes of Indians in the United States, and are held apart for this service by the government, in the department of the secretary of the interior. To these reservations the tribes are from time to time assigned, being granted certain privileges and possessions, other than the land, and thereby encouraged

to education and civilization. The following table gives the census of the Indian tribes of America in the years named, excepting that the estimates made prior to 1850 did not include the Indians of Texas, or those of the territory gained from Mexico:

1.	1789.	Estimate of secretary of war.....	76,000
2.	1790-91.	" " Gilbert Inlay.....	60,000
3.	1820.	Report of Morse on Indian affairs.....	471,036
4.	1825.	" " secretary of war.....	129,366
5.	1829.	" " " ".....	312,920
6.	1834.	" " " ".....	312,610
7.	1836.	" " superintendent of Indian affairs.....	253,464
8.	1837.	" " " ".....	302,498
9.	1850.	" " H. R. Schoolcraft.....	388,229
10.	1853.	" " U. S. census, 1853.....	400,764
11.	1855.	" " Indian office.....	314,622
12.	1857.	" " H. R. Schoolcraft.....	379,264
13.	1860.	" " Indian office.....	254,370
14.	1865.	" " " ".....	294,574
15.	1870.	" " U. S. census.....	313,712
16.	1870.	" " Indian office.....	313,370
17.	1875.	" " " ".....	305,008
18.	1876.	" " " ".....	291,882

The following table exhibits the location and number of 185 tribes, 316,113 souls, and the names of the different reservations apportioned to them:

TRIBE.	Number of Souls.	RESERVATION.	TERRITORY.
Aleasas.....	100	Alesea Reserve.....	Oregon.
Apaches, 27 divisions, 94 to 1805 each.....	14,071	Various reserves, agencies, and other points.....	Arizona, New Mexico, and Ind. Ter.
Arapahoos, North.....	1,092	Red Cloud Agency.....	Wyoming.
" South.....	1,644	Cheyenne ".....	Ind. Ter.
Aravipais.....	200	Camp Grant.....	Arizona.
Arickarees.....	1,616	Fort Berthold.....	Dakota.
Assinaboines.....	4,698	Milk River Agency.....	Montana.
Bannocks.....	600	Fort Hall Reserve.....	Idaho.
" ".....	1,200	Shoshone ".....	Wyoming.
Blackfeet.....	1,500	Blackfeet Agency.....	Montana.
Bloods.....	1,500	" ".....	" "
Caddoes.....	521	Wichita ".....	Ind. Ter.
Cakokiamis.....	85	Chehalis Reserve.....	Wash. Ter.
Calapooias.....	24	Grande Ronde.....	Oregon.
Callispells.....	114	Fort Colville.....	Wash. Ter.
Cancons.....	149	Round Valley.....	California.
Cayugas.....	143	Cattaraugus.....	New York.
" ".....	22	Tonawanda.....	" "
Cayases.....	385	Umatilla Reserve.....	Oregon.
Chasta-Scotons.....	200	Malheur ".....	" "
Chehalis.....	212	Chehalis ".....	Washington Ter.
Cherokee.....	17,217	Nation.....	Indian Territory.
" ".....	300	N. Carolina, Georgia & Tenn.....	" "
Cheyennes, North.....	1,262	Red Cloud Agency.....	Wyoming.
" South.....	2,250	Cheyenne Reserve.....	Indian Territory.
Chickasaws.....	6,000	Nation.....	" "
Chilions.....	400	Camp Apache.....	Arizona.
Chimehuevas.....	450	Colorado River.....	" "
Chinooks.....	250	Chehalis Reserve.....	Washington Ter.
Chippewas, 23 divisions, 115 to 3,100 each.....	24,810	Various reserves, agencies, and other points.....	Minnesota, Dakota, etc.
Chocktaws.....	16,000	Nation.....	Indian Territory.
Clackamas.....	57	Grande Ronde.....	Oregon.
Clatsops.....	138	Chehalis Reserve.....	Washington Ter.
" Coast.....	28	Grande Ronde.....	Oregon.
Coahuilas.....	800	Klamath Reserve.....	" "
" ".....	150	Colorado River.....	Arizona.
Cocopahs.....	800	Port Isabel.....	California.
" ".....	108	Colorado River.....	Arizona.
Cœur d'Alenes.....	1,349	Cœur d'Alene.....	Idaho.
Colvilles.....	1,100	Fort Colville.....	Washington Ter.
Comanches.....	2,643	Kiowa Agency.....	Indian Territory.
" Penetethka.....	345	Wichita Agency.....	Indian Territory.
Coosas.....	123	Alesea Reserve.....	Oregon.
Cowlitz.....	210	Chehalis Reserve.....	Washington Ter.
Cow Creeks.....	28	Grande Ronde.....	Oregon.
Creeks.....	13,000	Nation.....	Indian Territory.
Crows, Mountain.....	3,000	Mountain Crow.....	Montana.
Crowc, River.....	1,200	River Crow Reserve.....	" "
" other River.....	1,240	Milk River Agency.....	" "
Delawares.....	30	Kiowa Agency.....	Indian Territory.
" ".....	81	Wichita ".....	" "
D'Wamishes.....	400	Tulalip Reserve.....	Washington Ter.
Flatheads.....	471	Flathead ".....	Montana.
Foxes, Mississippi.....	374	Quapaw ".....	Indian Territory.
" Missouri.....	43	Great Nemaha.....	Nebraska.
Gros Ventres.....	600	Fort Berthold.....	Dakota.
" Oregon.....	1,100	Milk River Agency.....	Montana.
Hamptolope.....	97	Chehalis Reserve.....	Washington Ter.
Hobs.....	73	Quinalt ".....	" "

TRIBE.	Number of Souls.	RESERVATION.	TERRITORY.
Hoonsoltos	113	Hoopa Valley	California.
Hoopas	304	"	"
Hualpais	620	Colorado River	Arizona.
Humboldts	130	Hoopa Valley	California.
Ionis	85	Wichita Reserve	Indian Territory.
Iowas	226	Great Nemaha	Nebraska.
Kahmltpahs	100	Yakama Reserve	Washington Ter.
Kansas or Kaws	522	Kansas	Indian Territory.
Kaskaskias	30	Quapaw	"
Keawahs	117	Tule River	California.
Kechies	106	Wichita	Indian Territory,
Kickapoos	621	Sac and Fox	"
King's River, Lower	175	Tule River	California.
Upper	410	"	"
Kiowas	1,700	Kiowa	Indian Territory.
Klamaths	550	Klamath	Oregon.
Klikitats	200	Yakama	Washington Ter.
Klinquits	200	"	"
Koolenays	471	Flathead	Montana.
Kowassayes	600	Yakama	Washington Ter.
Little Lakes	169	Round Valley	California.
Lipans	400	Scattered	Florida.
Luckamutes	23	Grande Ronde	Oregon.
Makahs	558	Makah Reserve	Washington Ter.
Manaches	211	Tule River Reserve	California.
Mandans	450	Fort Berthold	Dakotah.
Maricopas	300	Maricopa Reserve	Arizona.
Mary's River	32	Grande Ronde	Oregon.
Menomonees	1,480	Green Bay Reserve	Wisconsin.
Meethows	626	Fort Colville	Washington Ter.
Miamis	97	Quapaw	Indian Territory.
	345	Scattered	Indiana.
Miscolts	216	Hoopa Valley	California.
Missourias	371	Otoe Reserve	Nebraska.
Modocs	147	Quapaw	Indian Territory.
	100	Klamath	Oregon.
Mohaves	1,540	Colorado River	Arizona.
Molialus	66	Grande Ronde	Oregon.
Molels	57		
Moquis, Pueblos, 7 divisions, } 125 to 525	1,672	Villages	Arizona.
Muckleshoots	100	Muckleshoot Reserve	Washington Ter.
Munsees	111	Munsee	Wisconsin.
Navajoes	9,063	Navajoe	New Mexico.
	2,000		Arizona.
Nehalims, coast	36	Grande Ronde	Oregon.
Nespectums	100	Fort Colville Reserve	Washington Ter.
Nestucalips	200	Grande Ronde	Oregon.
Nez-Perces, 3 divisions, from } 420 to 900 each	2,170	Nez-Perces Reserve	Idaho.
Nez-Tuccas, coast	58	Grande Ronde	Oregon.
Nisqually	230	Nisqually Reserve	Washington Ter.
Ochecholes	100	Yakama	"
Okanagans	411	Fort Colville	"
Omahas	951	Omaha	Nebraska.
Oneidas	198	Oneida	New York.
" Wisconsin	1,279	"	Wisconsin.
Onondagas	99	Alleghany	New York.
"	46	Cattaraugus	"
"	58	Onondaga	"
Oregons	58	Grande Ronde	Oregon.
Osages, 8 divisions, from 237 } to 936 each	3,956	Osage Reserve	Indian Territory.
Otoes	323	Otoe	Nebraska.
Ottawas, 4 divisions, from 142 } to 3975 each	5,904	Lake Superior	Michigan.
Owen River	4,798	Quapaw Reserve	Indian Territory.
Papagoes	6,000	Tule River	California.
Palouises	400	Papagoe	Arizona.
Pasquaquoddies	200	Yakama	Washington Ter.
Pawnees, 5 divisions, from 360 } to 759 each	2,817	River St. Croix	Maine.
Pawnee Reserve		Pawnee Reserve	Nebraska.
Pend d'Oreilles	1,026	Flathead	Montana.
Peoribscots	300	Oldtown	Maine.
Peorias	47	Quapaw Reserve	Indian Territory.
Plankeshaws	40	Quapaw	"
Piegans	2,450	Piegan	"
Pimas	4,000	Pima	Montana.
Pisquoses	200	Yakama	Arizona.
Pit Rivers	64	Round Valley	Washington Ter.
Poncas	730	Ponca Reserve	California.
Potter Valleys	293	Round Valley	Dakota.
Pottawotomies, 3 divisions, 60 } to 1600 each	2,060	Lake Superior	California.
Pueblos	9,500	Pottawotomie Reserve	Michigan.

RESERVATUM ECCLESIASTICUM, a provision of the religious peace of Westphalia, so very celebrated in German history, that a brief explanation seems necessary. By this clause of the treaty of Westphalia (1549), it was enacted, that if the holder of any ecclesiastical dignity, or of any territorial jurisdiction or property annexed to such ecclesiastical dignity, should change his religion, the dignity, territorial jurisdiction, or property held by him, should not be thereby alienated from the church from which he seceded, but should be still "reserved" for that church, and for the legitimate successors of the seceder. It was chiefly out of the disputes regarding the violations of the reservatum ecclesiasticum that the thirty years' war arose.

RESERVE, in army affairs, has several meanings. First, in a battle, the reserve is a body of troops held somewhere in the rear, generally out of fire, and kept fresh, in order that they may interfere with decisive force at any point where yielding troops require support, or an advantage gained needs powerful following up. The reserve of ammunition is a magazine of warlike stores, situated between an army and its base of operations, sufficiently retired from the front to be safe from sudden raids of the enemy, and

at the same time advanced enough to allow of the supply actually in the field being speedily replenished.

The reserve of a nation is that force upon which the national defense is thrown, when its regular armies have failed in securing its safety. This reserve may be the *levée en masse* of the whole adult male population, or it may consist of a smaller section of the people duly trained to arms. The latter is, of course, the preferable system, when the arms of scientific modern warfare are to be brought into action. In different countries the reserves are organized on very different principles. In Great Britain they comprise the army reserve, the enrolled pensioners—both of which consist of soldiers who have served in the army—the militia, yeomanry, volunteers, and trained constabulary. The numbers of the reserve forces provided for in the army estimates of 1876-77 were as follows:

Militia.....	139,619
Yeomanry cavalry.....	15,078
Volunteers.....	168,750
Army reserve force (including enrolled pensioners)—first-class.....	10,000
second-class..	21,000
	<hr/>
	354,447

Of the volunteers, 31,823 were artillery volunteers, 366 light horse, 6,295 engineers, 139 mounted rifles, 1458 permanent staff, and 128,669 rifle volunteers.

The scheme of army reorganization, which has been carried out during the past few years, has had a very important bearing on the reserve forces. In 1870 it was attempted, by modifying somewhat the conditions of enlistment into the regular army, to make the provisions for securing and maintaining a numerically strong army reserve more efficient than they had hitherto been. Enlistment continued as before to be for twelve years; but service in regiments going abroad was to be for six years, while the remaining six years' service was to be in the reserve, the men being liable to be called out like the naval reserve, and receiving a pay of 4d. a day. In 1876 men commenced to pass from the colors into the reserve, which is expected ultimately to reach about 80,000 men.

By an order in council of March 31, 1871, the power of the lord lieutenant ceases, and the management of the reserve forces in counties is vested in the ministers of the crown.

One of the objects chiefly kept in view in the comprehensive scheme of 1872 for the reorganization of the army was the bringing of the auxiliary forces into closer and more mutually helpful relations with the regular army. The main feature of that scheme is the localization of the combined military forces in certain territorial districts, so that there shall belong to each such district two line battalions, two militia battalions, and volunteers, formed into an administrative brigade, the whole to rest on the brigade depot as center. Arrangements were made to secure that a larger number of officers of the line regiments should pass into the militia and the yeomanry, and that the efficiency of the reserve should increase. The aim of the measure was "to unite the spontaneity, and all the other advantages of the auxiliary forces with the highest amount of training that the regular army could furnish to any other body of men."

RESERVED LIST, in the royal navy, a device for expediting the promotion of officers who are still of an age for active service. Under certain orders in council of 1851 and 1853, old officers of good service were selected for promotion to the next grade on the reserved list. This formed a bar to any further promotion; and removed the officer from active employment, except in the remote contingency of the active list being exhausted, when these "reserved" officers would be liable to be called upon to serve. For all practical purposes, however, the reserve list was a retired list. The officers placed on it obtained the half-pay of the rank to which they were promoted, and their removal gave vacancies for the promotion of younger and more efficient men. In the navy estimates for 1876-77, while provision was made for 607 naval officers on the unemployed active list, and for 2,175 on the retired list, a sum of £44,133 was allotted to 180 naval officers on the reserved list. The list is dying out, as, under the retirement scheme of 1870, absolute retirement according to age was substituted.

RESERVOIR, a receptacle for storing water for any purpose, but chiefly for the supply of towns, for driving machinery, feeding canals, irrigation, or for some process of manufactures. Generally, every water-works' establishment, for the supply of a town, requires to construct one or more reservoirs for providing compensation to the mills situated on the stream, for the water that is abstracted from any of its feeders.

The most advantageous position for a store reservoir is that where there is a narrow gorge in a valley widening out upward into a flat expanse, thereby enabling a comparatively small dam or embankment formed in the gorge, to impound a large body of water; but in many cases where there is no such choice, the embankment may require to be placed across a wide part of a valley which narrows as it ascends, thereby requiring a great embankment, in proportion to the quantity of water impounded. Sometimes reservoirs have to be formed on flattish ground affording no great natural facilities for storing water; and in such cases they may require to be embanked wholly or nearly round and round. Where a reservoir requires to be constructed on perfectly level

ground, the excavation must be calculated to be exactly equal to the embanking. The worst possible situation for a store reservoir is on the slope of a hill.

In many cases, natural lakes are used as reservoirs, means being adopted for raising or lowering the surface of the water, the difference between the lowest and the highest level of the lake's surface, multiplied by its area, being the measure of the available storage. Instances of this occur in Loch Leven, Kinross-shire, for the supply of the mills on the river Leven; in Loch Katrine and Loch Vennachar, for the supply of the city of Glasgow, and for the compensation required by the millers on the river Teith, in consequence of the abstraction of the Loch Katrine water, and in many other similar cases both for the use of towns and for water-power.

The capacity of a reservoir necessary for making nearly the whole water of a district available for use depends much on the climate. Where droughts are of long continuance, its capacity requires to be proportionately large, but generally in Great Britain a capacity of six or seven months' supply is reckoned sufficient.

As illustrative of the very different facilities afforded by different sites for storing water, an instance occurs of two reservoirs of the Edinburgh water trust, whereof one with an embankment containing 175,000 cubic yards of earthwork impounds only 17 millions of cubic ft. of water; while another, with an embankment of 53,000 cubic yards, impounds 85 millions of cubic ft., there being a single embankment across a valley in both cases. Generally, the structure for impounding water is an earthwork embankment, with a slope toward the water of 3 or 4 horizontal to 1 perpendicular, a breadth across the top of from 6 to 12 ft., the height being from 4 to 7 ft. above the water, and an outside slope of from 2 to $2\frac{1}{2}$ horizontal to 1 perpendicular. The earthwork ought to be formed in thin layers well rammed, and to have a puddle-wall of good well-worked clay in the center, the foundation of the puddle being a trench dug down to impervious rock or clay. The face toward the water requires to be protected by stones; and when a reservoir is large those stones must be "pitched"—i.e., regularly set by hand—so as to be able to resist the lash of the wave. In all cases there is imperatively required a waste-weir, to allow flood-waters to escape without risk of overflowing the dam. It ought, if possible, to be placed on the solid ground; and if it can be cut through solid rock, that is best, and saves a great expense for masonry. The width of the waste-weir must be regulated by the catchment or extent of gathering-ground of the reservoir, and by the rain-fall of the district; but for a given catchment and rain-fall, a reservoir having a small area ought to have a larger waste-weir than one having a larger area, as the latter would allow flood-water to accumulate without rising to so high a level as it would in the former. Generally, however, from 12 to 20 ft. of length of waste-weir may suffice for a square mile of catchment. In some cases, dams across gorges, for the purpose of forming reservoirs, are constructed of walls of heavy masonry, instead of earthwork embankments. Those across rivers for dividing the water into mill-leads, and for retaining the water which would otherwise be wasted at meal-hours, are generally constructed of stone, but sometimes of timber or iron.

The word dam is very often used incorrectly in Scotland to indicate a reservoir or sheet of water, instead of the structure made use of to form the reservoir, which is its proper meaning. A reservoir requires a sufficient outlet at the bottom by means of a tunnel, culvert, or iron pipes provided with suitable sluices, and these ought properly to be so arranged as that access can be had to them even when the reservoir is full.

Most of the disasters from the bursting of reservoirs have arisen from the want of sufficient waste-weir, and from the embankments being overtopped in consequence by the water, and the outer slope being washed away, so as to deprive the puddle-wall of its support; but some accidents have occurred from the outlet being by a wooden box or trough through the embankment, and that being neglected and allowed to get rotten. The bursting of the Bilberry reservoir, above Holmfirth, which occurred in 1852, arose from the embankment having sunk to, and being allowed to remain at, a level actually below that of the waste-weir, so that it was overtopped; but the Bradford reservoir embankment of the Sheffield water-works which burst in 1864, gave way before the water had risen to the level of the waste-weir; and much difference of opinion exists as to the cause, some engineers contending that the disaster was caused by bad workmanship in the embankment itself, and others that it was owing to a landslip under the embankment.

Distributing reservoirs for towns, used chiefly for storing up the surplus water during the night, which otherwise might mostly go to waste, ought to hold at least half a day's supply, and ought to be placed high enough to command the highest parts of the town. They are generally built of masonry or brick-work, but are sometimes made of cast iron, and now occasionally of boiler-plate—in which last case they are best of circular form. There is one of that description on the highest part of Edinburgh castle. In India and in the south of Europe, where long droughts prevail, very large reservoirs have been constructed for supplying water for the purpose of irrigation.

RESHD, one of the most industrious and extensively commercial towns in Persia, capital of the maritime province of Ghilan, stands on the bay of Enzelli, a lagoon on the s. w. shore of the Caspian sea, 150 m. n. w. of Teheran. It is in great part covered with trees, so that no accurate idea of its extent can be obtained by viewing it from any one

point. The houses are all tiled and are neatly built, and the streets paved; water is supplied by an aqueduct, and there are a palace, vast, gloomy, and ruinous; numerous caravanseries, large bazaars, and about 1200 shops and warehouses. Indian wares are imported from Balfrsch, in Mazanderan, and European manufactures from Russian Armenia. Extensive manufactures of deservedly celebrated embroideries are carried on. Pop. upward of 20,000. Enzelli, the port of Reshd, on the Caspian sea, about 18 m. distant, has 2,500 inhabitants.—Eastwick's *Diplomate's Residence in Persia* (London, 1864).

RESIDUARY LEGACY is a legacy of all that remains after the debts and legacies have been paid out of the estate of a deceased person. Debts must always be paid before legacies, and the next thing to be done is to pay all the express legacies; and as these seldom absorb the whole of the free assets, the residuary legacy is more or less valuable according as the express legacies are smaller than the free assets. If the express legacies swallow up all the funds, the residuary legacy is worth nothing.

RESHID' PASHA', MUSTAPHA MEHEMED. See **REDSHID' PASHA', ante.**

RESINA, a t. of southern Italy, in the province of Naples, situated at the foot of Vesuvius, and facing the sea. Pop. '71, 12,175. Resina is built on the site of ancient Herculaneum. Exquisite fruits are grown, and the famous *Lacrimæ Christi* wine is made in the vicinity. It is surrounded by country houses, and is a place of recreation for the Neapolitans on account of its salubrity. The ascent of mount Vesuvius is begun at Resina.

RESINS, a class of natural vegetable products composed of carbon, hydrogen, and oxygen. They are closely allied to the essential oils, all of which when exposed to the air absorb oxygen, and finally become converted into substances having the characters of resin; and in most cases they are obtained from the plants which yield them, mixed with and dissolved in a corresponding essential oil. Like the natural oils the natural resins are usually mixtures of two or more distinct resins, which admit of separation by their unequal solubility in different fluids.

The following are the general characters of this class of compounds: At ordinary temperatures they are solid, translucent, and for the most part colored, although some are colorless and transparent. Some are devoid of odor, while others give off an aromatic fragrance from the admixture of an essential oil. In their crude state they never crystallize, but are amorphous and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are usually described as non-volatile, but it has been recently shown that common resin may be distilled in a current of superheated steam. They are insoluble in water, but dissolve in alcohol, ether, and the essential and fixed oils. They are insulators or non-conductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are divisible into the *hard resins*, the *soft resins*, and the *gum-resins*.—The hard resins are at ordinary temperatures solid and brittle; they are easily pulverized, and contain little or no essential oil. Under this head are included copal, the varieties of lac, mastic, and sandarach, and the resins of benzoin (commonly called gum-benzoin), jalap, guaiacum, etc.—The soft resins admit of being molded by the hand, and some of them are viscous and semi-fluid, in which case they are termed *balsams*. They consist essentially of solutions of hard resins in essential oils, or admixtures of the two. They become oxidized and hardened by exposure to the air into the first class of resins. Under this head are placed turpentine, storax, balsam of copaiva, and the balsams of Canada, Peru, and Tolu.

The gum-resins are the milky juices of certain plants solidified by exposure to the air. They consist of a mixture of resins and essential oils with a considerable proportion of gum; and on this account, when rubbed up with water, they yield a turbid or milky fluid from the dissolved gum, retaining the resin and oil in suspension, and are only partly soluble in alcohol. Some of them, as ammoniacum, assafetida, euphorbium, galbanum, gamboge, myrrh, olibanum, etc., are valuable medicinal agents; while others, as caoutchouc (or india-rubber) and gutta-percha, are of great value in the arts and in manufactures.

The resins are very widely diffused throughout the vegetable kingdom. But there are certain families of plants which are especially rich in them. They are generally obtained by making incisions into the wood of the trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood by boiling alcohol. The crude resins are separated from the essential oils with which they are usually mixed by distillation with water, the resin remaining while the oil and water pass off; and from the gummy and mucilaginous matters by alcohol, which dissolves out the pure resins, which can be precipitated from their alcoholic solution by the addition of water.

The resins are extensively employed in medicine; and in addition to the almost

innumerable applications of caoutchouc and gutta-percha, various resins are of service in the preparation of varnishes, soaps, pigments, artificial light (resin-gas), etc.

Various fossil resins are known, of which the most important is amber. Some chemists place bitumen and asphalt among this class; and among the fossil resins described by mineralogists may be mentioned fichtelite, hartite, idrialite, ozokerite, scheererite, xyloretin, etc.

The common resin, or rosin, of commerce exudes in a semi-fluid state from several species of pine, especially *pinus taeda*, *P. mitis*, *P. palustris*, and *P. rigida* of North America, *P. pinaster*, *P. pinea*, and *P. laricina* of southern Europe, and *P. sylvestris* of northern Europe. The process of collecting it is very simple: a longitudinal slice of the bark and wood, about a foot in length, is taken off by means of an axe with a curved blade, and at the bottom of the groove thus made a small piece of bent wood or thin metal, as tin or zinc, is driven into a curved cut made by one blow of the axe; this forms a sort of spout, which catches the liquid resin as it runs from the wound, and guides it into a small pot made of common clay burned. At certain periods these pots are emptied, and their contents put into casks for transport to the distilleries, where the volatile essential oil is removed from the resin. The resin thus procured is used very extensively in the manufacture of common yellow soap, also for sizing paper and various other purposes, including the preparation of ointments and plasters in pharmacy.

The other resins most generally known and used in Europe are anime (q. v.), copal (q. v.), dammar (q. v.), mastic (q. v.), sandarach (q. v.), frankincense (q. v.), lac (q. v.). In addition to these there are many which are of essential service in other countries, as the piny resin or dhoop, obtained from *vateria indica*; black dammar, obtained from *cannarium strictum*; saul resin, or dammar batu, from *shorea robusta*—all of which serve many useful purposes in India, China, Japan, and other Asiatic countries. The forests of South America furnish many others.

RESISTANCE OF FLUIDS, the opposing force given by liquids and gases to bodies resting in or on them or moving through them. Much of the principles included are embraced in *hydrostatics* (q. v.). As water presses in all directions alike at any point, it follows that when a floating body is at rest the pressure which it exerts in a downward direction is exactly balanced by the upward pressure of the water beneath it, and this will be irrespective of the shape of the body. If, however, the body is made to move through the water, the resistance of the water, and therefore of the power which must be applied to the body, will vary according to the shape of the moving body. This is illustrated in the forms of sailing and other vessels. Those which are blunt at the bow and stern are hard and slow sailers. They may be sharp at the bow, but if blunt or square at the stern the great tendency to create a vacuum at that point will retard the motion of the vessel. If the lines are very sloping the water freely passes to the rear with little retarding power. The resistance of a fluid to a body moving through it is proportional to the square of the velocity, so that in general terms a body moving 4 ft. per second would require four times as much power to propel it as if moving 2 ft. per second ($4^2 = 16$ and $2^2 = 4$). The resistance of air follows the same law, except for great velocities, as in the case of projectiles, when the condensation produced in the air increases the resistance still more. Many accurate experiments have been made in the French army and navy, particularly by M. Thibault and gen. Morin. From their experiments it was found that the resistance of air to the movement of a plane surface at a velocity of one yard per second is 0.1295 pounds per square yard, when the surface is perpendicular to the direction, and that the pressure increases or decreases very nearly in proportion to the square of the velocity. The shape also of the solid has very nearly the same influence as when it moves through water.

RESISTING A CONSTABLE is an offense punishable by justices of the peace in a summary manner.

RES JUDICATA, in law, means that the subject-matter of an action has been already decided by a court of competent jurisdiction, and if so, a plea setting up the *res judicata* is a sufficient defense. In order to be binding, however, the suit in the former case must have been between the same parties.

RESOLUTION, in music. In the progression of chords in a musical composition, there are certain chords that require to be followed by certain others, or, as it is called, *resolved* into them, otherwise, a sense of incompleteness is left on the ear. Thus the chord of the dominant seventh must be resolved by the tonic harmony, the major third ascending a semitone to the key-note, and the seventh descending one degree to the third of the key:

The diminished triad is similarly resolved, and all chords immediately derived from the dominant harmony. The chord of the added ninth is resolved by descending a second to the fifth of the tonic.

RESOLUTION OF FORCES. See COMPOSITION.

RESOLUTIVE CLAUSE is the technical name given by the law of Scotland to a clause in a deed of entail, the object of which is to declare that if the heir of entail in possession do any of the things which he is expressly prohibited from doing, such as attempting to sell the estate, or alter the order of succession, his right to the estate shall cease, and the estate shall pass on to the next heir.

RESPECTING—RESPECTANT, in heraldry, a term used to describe two animals borne face to face. Beasts of prey rampant when so borne, are, however, said to be *rampant combatant*.

RESPIRATION, ORGANS AND PROCESS OF. The great objects of respiration or breathing are, first, the introduction into the system of oxygen, by which the products resulting from the disintegration or breaking up of the muscular, nervous, and other tissues of the body are converted into compounds, which are easily eliminated or removed by the excreting organs (as the kidneys, lungs, skin, etc.); and, secondly, the removal of the most noxious, and consequently, the most important of these products, carbonic acid, through special respiratory organs, which, in most air-breathing animals, except insects, are lungs; while in water-breathing animals, excepting those very low in the scale of organization, they take the form of *branchiæ*, or gills. In all the vertebrated animals, excepting in fishes, and in the amphibians during their young state,* the respiratory organs are more or less complicated internal air-sacs, communicating through the throat with the external atmosphere. The simplest known form in which these LUNGS or internal air-sacs exist is as a pair of elastic membranous bags placed close beneath the vertebral column, communicating with the surrounding atmosphere by a tube known as the wind-pipe, or *trachea*, which opens through the larynx, or organ of voice, into the throat. These bags are lined by a delicate, thin, and moist membrane, called a mucous membrane, embedded in, and partly beneath which is a vascular network, through which all the blood in the animal's body is in turn driven by the heart. The moist partition between the blood in this network and the air in the interior of the lungs is so thin, that after having (by its moisture) dissolved the oxygen of the air, it permits of its passage into the moving current of blood, whilst through the same agencies carbonic acid simultaneously passes in an opposite direction from the blood into the air. To complete the apparatus, there are certain muscles under whose action the bags are emptied of their vitiated contents and refilled with pure air. Such are the respiratory organs as they occur in that remarkable animal, the *proteus anguinus*, found in the dark caves of Carinthia, and belonging to the order *amphipneusta*, referred to in the foot-note. In the more highly organized animals and in man, we find these elementary essential parts complicated and modified in a great variety of ways. Confining our remarks for the present to the respiratory process as it occurs in man and mammals, we may consider the anatomical details under three different heads. *First*, there must be a special respiratory organ—the lungs—affording by its internal arrangement an immense extent of internal surface, covered by vascular net-work, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; *secondly*, there must be such an arrangement of the circulating system that fresh blood may be perpetually driven from the right side of the heart through the lungs, and onward to the left side of the heart; and *thirdly*, there must be arrangements for the frequent and regular change of the air contained in the lungs. These three points will be considered in the order in which we have placed them.

A sufficiently large internal aerating surface might of course be obtained by increasing the size of the air-bags themselves, but this would involve an increase of size in the animal. In examining the lungs of different animals, two plans are observed for increasing the internal surface without increasing the total bulk of the lungs. According to one plan, the internal surface is, as it were, molded into cells, separated laterally by partitions, somewhat like the cells as seen in a section of honeycomb, or more like the appearance presented by the second or honeycomb stomach of ruminating animals; according to the other, enormous multitudes of little lung-sacs partitioned, as will be presently shown, in their interior, are clustered round the ultimate branch of a common air-tube, which communicates with all of them. If we can conceive a bunch of grapes with its stem and all its minute branches, and the grapes attached to the ends of these branches completely hollow, we get a good idea of this second plan, except in so far as the partitioning of the terminal cells is concerned. By the former method, which occurs in amphibians and reptiles, the lung sacs are merely rendered more cellular in their interior; while, by the latter plan, compound lungs are formed, such as occur in birds and mammals, including man. Hence these two varieties of lung-structure correspond

* A few of the amphibians, such as the species of the genera *Proteus* and *Siren*, retain their *branchiæ* during their whole life: hence they are placed in the order *amphipneusta*, a term indicating their double mode of breathing.

to the so-called cold-blooded and warm-blooded animals respectively. In the lungs of the frog and the lungs of the turtle, we have illustrations of the first plan (the cellular lung-sac), while in figs. 1 and 2 we have diagrammatic illustrations of the human lung. Fig. 1 is a shaded diagram (copied from Mr. Marshall's admirable series of *Physiological Diagrams* to show the ramifications of the air-tubes in the human lungs. L is an outline representing the left lung; T, the main air-tube, called the windpipe or *trachea* (so called from the Greek word *tracheia*, rough, and similarly termed in Latin the *arteria aspera*, although not an artery, as we now employ the word), descends through the neck from the larynx or organ of voice into the chest; B shows the right and left *bronchi*, or primary divisions into which the windpipe separates, one for each lung. Each bronchus enters the lung at the so-called root, and divides and subdivides into smaller branches, which never coalesce, but continue separate, like the branches and twigs of a tree. These are the *bronchial tubes*, or the *bronchiæ* of some writers; the smallest shown in this diagram, *b, b*, undergo many further subdivisions, until (to use Mr. Marshall's own description) "at length they form an immense number of minute tubes, not more than $\frac{1}{100}$ th of an in. in diameter, each of which ends in a cluster of cells, or, as it may otherwise be described, opens into a small membranous sac, a little wider than itself, having a cellular internal surface very similar to that of the frog's lung, but of course on a microscopic scale." In fig. 2 (also

FIG. 1.

FIG. 2.

FIG. 3.

copied from Mr. Marshall's diagrams) there is a representation, magnified about 100 diameters, of three of these clusters of cells, or little lung-sacs, from the human lung. In this figure, *b* is a small air-tube, or bronchial tube, from which several of the finest or ultimate tubes proceed; *c* shows the outer surface of one of the lung-sacs, or *lobules*, as they are commonly termed; *d*, the inner surface of another, which has been cut open, so as to show the ultimate recesses of the lung to which the air has access—viz., the *air-cells*. According to Rossignol, the ultimate bronchial ramifications terminate in a shape resembling that of an inverted funnel, and hence he applies the term *infundibula* to these endings. In fig. 3 (copied from Rossignol's *Memoir*) there is a representation of the termination of an ultimate bronchial tube in the lung of a dog: *a* represents an ultimate tube, or lobular passage, branching toward the infundibula; *b* is the interior of one of the seven infundibula shown in the figure; while *c* represents one of the numerous septa or partitions projecting inward on the infundibular wall, and forming the air-cells. According to Todd and Bowman, the diameter of the lobular passages is from $\frac{1}{100}$ th to $\frac{2}{100}$ th of an in., while that of the cells ranges from $\frac{1}{300}$ th to $\frac{1}{300}$ th of an inch. It is on the inner surface of these air-cells that the net-work of minute capillaries is spread in which the act of aëration takes place. Each lobule receives air through its own bronchial tube alone, and consequently there is no direct communication between the air-cells of adjacent lobules. These lobules are closely compressed upon one another; and collectively, together with the connective tissue which unites them to one another, make up the great mass of the lungs. To such an extent is the process of subdivision carried out, that, according to calculation, the lungs of an adult man contain at least 600 millions of these air-cells. It is in consequence of the air included in these cells that the pulmonary tissue has a soft spongy feel, and crackles when compressed between the fingers (see RESPIRATORY SOUNDS); and for the same reason, the lungs, and even small portions of them, even after strong pressure, float in water, it being extremely difficult to drive all the air out of the cells. The lungs (except in the fetal state, when no air

enters them) are thus the lightest organs, in relation to their size, in the body. Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they only weigh about three pounds and a half in men, and two pounds and three-quarters in women. Their color varies at different ages. At birth, they are of a pinkish white tint; in adult life, they are of a slate color, and present a mottled appearance; and in old age, they become of a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck; while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life (except in certain diseases, as for instance, pericarditis (q.v.), the inner margins of the lungs nearly overlap the heart, leaving only a roundish space, less than 2 in. in diameter, of that organ uncovered, while their lower borders extend to the cartilages of the ribs, and fit into the angle formed between those cartilages and the diaphragm. Each lung is invested by its own serous membrane, the pleura (q.v.), which serves the double purpose of facilitating the movements which the lungs undergo in the act of respiration, and of suspending each lung in its proper position. In the latter function, the pleurae are essentially assisted by the great air-tubes and blood-vessels, which collectively form what are termed the roots of the lungs.

The structure of the air-tubes and the lungs themselves next requires consideration. Beginning with the upper portion, we have to consider the *trachea*, or windpipe, which in the human subject descends in the middle line from the larynx (q.v.) to the level of the third dorsal vertebra, where it divides into the right and left bronchi. It is kept permanently open by from 16 to 20 cartilaginous rings, which surround two-thirds of the tube, and are incomplete behind, where the tube is completed by the same fibrous membrane which covers and unites the cartilages in front and on the sides. In this fibrous membrane are numerous tracheal glands (which probably furnish much of the vapor of the breath, and may occasion its odor), together with unstriped muscular fiber, to which the term *trachealis* muscle has been given. The trachea measures about 4½ in. in length, and is about three-quarters of an in. wide. Its mucous membrane is continuous through the glottis with that of the pharynx or throat, and is covered with ciliated columnar epithelium (q.v.). Of the bronchi, the right is wider, shorter, and more horizontal than the left. Their walls are composed on the same plan as those of the trachea. Upon entering the lung, each bronchus divides in the method already described. The walls of these bronchial tubes become thinner as they approach the air-cells. The cartilaginous portions which, in the primary divisions of each bronchus, partially retained the annular form, become gradually reduced to mere flakes, and finally cease in tubes of $\frac{1}{4}$ th or $\frac{1}{5}$ th of an in. in diameter. The unstriped muscular fibers occurring in the trachea are continued downward to the minutest tubes, forming a very thin layer, completely surrounding the canal, and the ciliated epithelium extends equally far. The terminal bronchial tube loses its epithelium and muscular coat at about $\frac{1}{4}$ th of an in. from the most distant air-cell to which it leads, and is thus reduced to a single coat, consisting of the basement membrane (see MUCOUS MEMBRANE), with yellow elastic fibers blended with it. Of this structure, the interlobular passages and the air-cells are composed.

The mode in which the blood is perpetually changed in the lungs next demands consideration. The venous or impure blood, collected from all parts of the body in the right side of the heart, is conveyed to the lungs by the pulmonary artery, which is about the size of the aorta, and, like that vessel, is furnished with three semilunar valves at its origin, which prevent the blood from regurgitating into the right ventricle of the heart (see CIRCULATION). The pulmonary artery divides, before entering the lungs, into a right and a left branch, which ramify as far as the lobules in company with the bronchial tubes. At this point, they distribute themselves on the outside of the lobules, in the so-called *interlobular fissures*, and penetrating between the air-cells, form a capillary network on and in the walls of the cells and of the lobular passages. This network empties its blood, which is now aerated, into minute venous radicles which converge to form larger veins, and these finally form the four pulmonary veins, which discharge their arterialized blood into the left side of the heart. The walls which support the capillary network of the lungs are (as Todd and Bowman observe) "for the most part much too thin to inclose the capillaries between the two layers of their substance, and therefore the capillaries project fairly into the air-cells by a great part of their circumference, being adherent to the wall by a narrow line only. The capillary wall is thus exposed and bare, in contact with the air of the cell, and nothing besides the delicate membrane of the capillary intervenes between the air and the blood. A capillary frequently passes through an aperture in the cell-wall, so as first to project into one cell, and further on into a contiguous one, but never becomes altogether free from the wall."—*Phys. Anat.* v. ii. p. 393. The diameter of these capillaries is about $\frac{1}{1000}$ th of an in., which is comparatively large, and admits of the passage of blood freely; and the air and the blood may be said to be in contact, since they are only separated by a delicate capillary wall, less than $\frac{1}{20000}$ th of an in. in thickness. If the rate of the blood in the capillaries be taken at an in. and three-quarters per minute (according to the estimate of Valentin, drawn from observation of the frog's foot), it has been calculated that the

blood would at each circuit remain in contact with the air about one second and a half. In all probability, however, the motion of the blood is quicker in the pulmonary capillaries of man and other mammals and of birds than in those of the frog's foot.

In addition to the pulmonary artery and the pulmonary veins, which convey the blood to and from the lungs for the purpose of aeration, there are other vessels, known as the bronchial vessels, for the nutrition of the lung itself, the distribution of which, and their mode of communication with the pulmonary vessels already described, have been subjects of much discussion; but into this we need not enter. The lungs are supplied with nerves from the anterior and posterior pulmonary plexuses, lying at the root of the organ, and composed of filaments of the pneumogastric and sympathetic nerves. The filaments from these plexuses accompany the bronchial tubes, in which they are finally lost. The part which these nerves play in the respiratory process will be considered after we have described the *movements of respiration*, by which the air in the lungs is being perpetually changed.

For a description of the shape and framework of the chest, see CHEST. The chest (or thorax, as it is termed by anatomists) is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backward), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm, and to a certain extent by the elevation of the ribs, and the widening of the intercostal spaces; while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breast-bone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised, and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is attended in men with very slight elevation of the ribs (about one-twentieth of an inch), while in women the elevation is much greater, especially in the upper ribs; the cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. MM. Beau and Maissiat describe three varieties of ordinary respiration—viz.: 1. Abdominal, or that chiefly effected by the diaphragm, and seen in the motion of the walls of the belly; 2. Costo-inferior, or that in which the seven lower ribs are observed to act; and 3. Costo-superior, or that effected in a considerable degree by the upper ribs. The first variety occurs in infants up to the end of the third year, and in males generally; the second in boys after the age of three, and in men; and the third in adult females. Our limited space precludes a detailed notice of the various muscles which are concerned in respiration. The total power of the respiratory muscles has been measured by several physiologists, among whom Dr. Hutchinson deserves special notice. He finds, as the average of 1500 experiments, that the power of expiration is nearly one-third stronger than that of inspiration, and he is of opinion that when the expiratory are not stronger than the inspiratory muscles, some disease is present. He tested the force of the two classes of respiratory muscles by causing persons to make the most powerful efforts of which they were capable, when breathing through the nose into an instrument termed a spirometer, and by this means he found that men of 5 ft. 7 or 8 in. in height have the greatest inspiratory power, it being equal, on an average, to a column of mercury of 2.75 in., while their expiratory power was equal to 3.97 inches. The following table is given by him as exhibiting the range through which these powers may vary within the limits of health.

Power of Inspiration.		Power of Expiration.
1.5 inches	Weak	2.0 inches.
2.0 "	Ordinary	2.5 "
4.5 "	Remarkable	5.8 "
7.0 "	Very extraordinary	10.0 "

The co-operation of the resilience of the lungs and the elasticity of the walls of the chest with the expiratory muscular movement, is probably the cause why the expiratory power, as tested by the height of a column of mercury, is greater than the inspiratory power. Dr. Hutchinson calculates that a man who raises 3 in. of mercury by an effort of inspiration exerts a force equal to 1000 lbs.; while the one remarkable case in which the mercury rose to 7 in., indicated a force of 2200 lbs., or nearly one ton.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into four parts—viz.: 1. Inspiration; 2. A short pause, not always observed; 3. Expiration; and 4. A considerable pause, occupying, according to Vierordt, about one-fifth of the whole time required for one complete respiratory act. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12 : 10 in adult males, and as 14 : 10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. According to Quetelet, at birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18.7; from 25 to 30, 16; from 30 to 50, 18.1: so that from 16 to 20 may be taken as the ordinary range for healthy adults, although Hutchinson gives the wide range of from 6 to 40. The average ratio which the number of respirations bears to the number of pulsations in a given time is about 1 : 4½, and if there is any great deviation from this ratio, there is probably some

obstruction to the aëration of the blood, or some disorder of the nervous system. Thus, in pneumonia (or inflammation of the lungs), in which a greater or less amount of pulmonary tissue is unfitted for its office, the number of the respirations increases in a more rapid proportion than the number of pulsations, so that the ratio becomes as 1 : 3, or even as 1 : 2. In hysteria, a similar or even greater deviation from the normal ratio may occur; and Elliotson records a case in which the respiratory movements were 98, or even 106, while the pulse was 104. On the other hand, in certain typhoid conditions, and in narcotic poisoning, the respiratory acts are diminished in number; the ratio of respiration to pulsations being as 1 : 6, or even 1 : 8.

We have next to inquire into the mode in which the muscular movements of respiration are kept up by nervous power. "There can be no doubt," says Dr. Carpenter, "that these movements, though partly under the control of the will, are essentially 'automatic' in their nature. Their chief centers consist of two ganglia; corresponding to the origins of the pneumogastric nerves, which are the principal excitor nerves which convey the stimulus on which these movements are dependent; whilst from the adjacent parts of the medulla oblongata and spinalis proceed the chief motor nerves by which they are carried into effect. And thus it happens that the whole of the encephalon may be removed from above, and the spinal cord (as far up as the origin of the phrenic nerve) from below, without suspending the most essential of the respiratory movements."—*Principles of Human Physiology* (6th ed., 1864, p. 274). It would carry us far beyond our assigned limits to notice the interesting series of phenomena that follow the division or irritation of the various branches of the pneumogastric nerve. We may, however, mention that when the trunks of this nerve are divided on both sides, the respiratory movements still go on, although with diminished activity. Hence, there must be other excitors to the action of the respiratory muscles. Amongst these the nerves distributed to the general surface, and particularly to the face, probably perform an important part; and in exciting the first inspiration, the fifth pair seem the principal agent. In support of this view, Dr. Carpenter adduces the well-known fact, that the first inspiratory effort of the new-born infant is most vigorously performed when the cool external air comes in contact with its face. Dr. Marshall Hall, in his *New Memoir on the True Spinal Marrow*, p. 29, relates a case in which the first inspiration was delayed simply because the face was protected from the atmosphere by the bedclothes; the instant they were lifted up, the infant breathed. Many familiar facts demonstrate the influence of the superficial nerves on the respiratory system in the adult as well as in the infant. "Every one," to use Dr. Carpenter's words, "knows that the first plunge into cold water, or the first descent of the stream of the shower-bath, or even the dashing of a glass of cold water in the face, will produce inspiratory efforts; and this fact has many important practical applications. Thus, in the treatment of asphyxia, whether congenital or the result of narcotic poisoning, drowning, etc., the alternate application of cold and heat is found to be one of the most efficacious means of restoring the respiratory movements, and a paroxysm of hysterical laughter may be cut short by dashing a glass of cold water in the face." The principal motor or efferent nerves concerned in bringing out the respiratory movements are the phrenic, going to the diaphragm; the intercostal, supplying the intercostal muscles; the facial and the spinal accessory nerves; although, as has been already mentioned, the superficial nerves generally exert a motor or efferent action.

How far the respiratory movements are under the influence of the will is a question which has given rise to much discussion. That, in their ordinary mode of performance, they are independent of the will, is obvious from their systematic occurrence during sleep, in cases of paralysis in which the power of the will is lost, in apoplexy, etc. At the same time, universal experience teaches us that these movements are partly, but not entirely under the control of the will. We can with little inconvenience, suspend the respiratory actions for a minute, or even longer, if we have previously introduced into the lungs a full supply of fresh air; but if the suspension be further prolonged the stimulus conveyed by the excitor nerves to the nervous centers becomes so strong, that by no effort of the will can we avoid making inspiratory efforts. It is asserted by M. Bourdon, an eminent French physiologist, in his *Recherches sur le Mécanisme de la Respiration*, that no person ever succeeded in committing suicide by simply holding the breath, but that such persons have attained their object by holding the face under water, because here another set of muscles is called into play, which are much more under the control of the will than those of respiration. If we may venture to seek for the reason why, in man and the higher animals, the respiratory actions are placed under the direction of the will, it may probably be found in the necessary physiological connection that exists between them and the production of those vocal sounds by which individuals (whether men or animals) can communicate their feelings and wishes to one another.

We shall complete the subject in so far as human physiology is concerned, by noticing (1) the greatest quantity of air that can be expelled by a forcible expiration; (2) the total quantity that passes through the lungs in a given time; (3) the effects of respiration on the air; and (4) the effects of suspension or deficiency of respiration.

When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control, and which may be estimated at about 40 cubic inches.* To this portion of the contents of the lungs the

* According to Hutchinson, as will be presently seen, this estimate is far too small.

term *residual air* is applied. In addition to this residual air, physiologists distinguish, in connection with the respiratory process, *supplemental air*, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; *breathing or tidal air*, which is the volume that is displaced by the constant gentle inspiration and expiration; and *complemental air*, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the supplemental, breathing, and complemental air, is designated as the *vital capacity*—a term originally introduced by Dr. Hutchinson, the inventor of the spirometer, who found, from nearly 5,000 observations, that of all the elements or factors which might be supposed to influence it, *height* alone stood in a definite and constant relation to it, this relation being expressed by the rule, that, "for every inch of stature from 5 to 6 ft., 8 additional cubic inches of air (at 60° Fahr.) are given out by a forced expiration after a full inspiration." Thus, the vital capacity for a man from 5 ft. to 5 ft. 1 in. being 174 cubic in., that for a man from 5 ft. 1 in. to 5 ft. 2 in. is 182 cubic in.; and so on. With regard to bodily weight as a factor, Dr. Hutchinson found, that "when the man exceeds the average weight (at each height) by 7 per cent., the vital capacity decreases 1 cubic in. per lb. for the next 35 lbs. above this weight." Age and muscular development do not influence the result so much as might have been expected. It has been not unfrequently observed that the vital capacity is small in athletic men, and that it has been in excess in persons by no means remarkable for physical power. The *maximum* vital capacity met with by Dr. Hutchinson was 464 cubic in.; this was in a man 7 ft. high, whose weight was 308 lbs.; the *minimum* was 46 cubic in., and occurred in the case of a dwarf whose height was only 29 in., and who weighed 40 lbs.

In estimating the effects of the respiratory process upon the air which passes through the lungs, we shall adopt the *data* afforded by the recent observations of Dr. Edward Smith, who has arranged a spirometer by which the quantity of air inspired may be registered from 1 to 100,000 cubic in., and therefore for any period. This instrument, says Dr. Carpenter (to whom Dr. Smith has communicated many of the following statements for insertion in the new edition of his *Human Physiology*), "he has used for 24 hours without intermission, except for meals, and he has ascertained the quantity of air inspired during sleep and in almost every condition met with during the day. From numerous experiments upon several persons, each extending over a whole day, he found that the average depth of inspiration was 33.6 cubic in. when at rest; and when walking at 1, 2, 3, and 4 m. an hour, 52, 60, 75, and 91 cubic in., and even 107 cubic in. when working the tread-mill. If we take 30 or 40 cubic in. as the average quantity exchanged at each respiration, we cannot but observe how small a proportion it bears to the entire amount which the lungs usually contain, for the 'residual air' which cannot be expelled is estimated by Dr. Hutchinson at from 75 to 100 cubic in.; and the 'supplemental air,' which can only be expelled by a forced expiration, is about as much more; the sum of the two being from 150 to 200 cubic in., or from 5 to 7 times the 'breathing volume.'" Now, it is obvious that if no provision existed for mingling the air inspired with the air already occupying the lungs, the former would penetrate no further than the larger air passages, and as this would be again thrown out at the next expiration, the bulk of the air contained in the lungs would remain altogether without renewal, and the expired air would not be found to have undergone any change. The law of the *diffusion of gases* (q.v.) here comes in play, for the air in the air-cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, toward and into the air-cells themselves.

The *total amount* of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. Dr. Smith found that during the day (6 A.M. to 12 P.M.), the average quantity of air inspired by several persons at rest was 502 cubic in. per minute, or a total of 542,160 cubic in.; and as the average quantity during the night was about 400 in. per minute, the total daily amount was 686,000 cubic inches. This quantity is largely increased by exertion, and Dr. Smith computes that the total amount actually respired by the unoccupied gentleman, the ordinary tradesman, and the hard-working laborer, would be 804,780, 1,065,840, and 1,568,390 cubic in. respectively.

The *alterations* in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen, and its replacement by a nearly corresponding bulk of carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations; it reaches 5.5 per cent (or more) when the respirations are only 6 in the minute, while it falls as low as about 2.6 per cent when the respirations are 96 in the minute. About 4.35 per cent of carbonic acid is, on an average, added to the air in ordinary respiration; while about 4.782 per cent of oxygen is removed; the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about $\frac{1}{4}$ th of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by con-

taining a great excess of carbonic acid (for ordinary atmospheric air only contains about one part of carbonic acid in 2,500 parts), and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, etc. Dr. Smith calculates that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7.144 oz. of carbon; and he estimates that it should be increased to 8.68 and 11.7 oz. for the non-laboring and laborious classes respectively, at their ordinary rate of exertion. We may add, that the total amount of carbonic acid is greatly increased by external cold, and diminished by heat; that it is increased by a moist, and diminished by a dry atmosphere; that it increases in both sexes to about the 30th year, when it remains stationary for 15 years, after which it diminishes; that at all ages beyond 8 years it is greater in males than in females, and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each 1 lb. of bodily weight being (according to Smith) 17.07, 17.51, and 17.99 grains at 48, 39, and 33 years of age respectively; that it is greatly increased by eating,* and is diminished by fasting; that it is increased by muscular exertion (Smith found that when walking 3 m. an hour he excreted 2.6 more carbonic acid than when at rest; while tread-wheel labor occasioned about double the excretion that was caused by walking); that it was diminished by sleep; and that it is increased in the exanthematous fevers (measles, small-pox, scarlatina, etc.), and in chlorosis; while it is diminished in typhus and in chronic diseases of the respiratory organs.

There has been much discussion with regard to the extent to which the nitrogen of the air is affected by respiration. Usually a small amount of this gas is given off, but the quantities absorbed and exhaled so nearly balance each other that its special action on the organism must be very trifling, further than as being a diluter of the oxygen, which would be too stimulating if breathed in a pure state. We therefore proceed to the consideration of the watery vapor with which the exhaled air is saturated. The amount of this fluid exhaled in 24 hours may range from about 6 to 27 oz., its usual range being between 7 and 11 oz. It is not pure water, but holds in solution a considerable amount of carbonic acid and an albuminous substance in a state of decomposition, which, on exposing the fluid to an elevated temperature, occasions a very evident putrid odor.

RESPIRATION, ARTIFICIAL, is required in all cases of suspended animation, from drowning, noxious gases, chloroform, etc. It may be performed either by forcing air into the lungs by means of a pipe passed through the mouth or the nostril into the glottis, or (which is usually preferable) by imitating the natural expansion of the chest by muscular effort, as by the methods invented by the late Dr. Marshall Hall and by Dr. Sylvester.

The best mode of forcing air into the lungs is by the use of a small pair of bellows, with the nozzle inserted in one of the patient's nostrils. The air should be driven into the lungs with extreme gentleness, the larynx being pressed backward against the spine, so that the air may not go into the esophagus and stomach. Gentle but firm pressure must be then applied to the chest to expel the introduced air, and fresh air again driven in; and this process of introducing and expelling the air alternately must be continued until either natural respiratory efforts appear, or the case becomes hopeless.

In the article **ASPHYXIA**, it is stated that one of the best methods of filling the lungs of an asphyxiated person with fresh air, is that of Dr. Marshall Hall. Dr. Sylvester's method (*The True Physiological Method of Restoring Persons apparently Drowned or Dead, and of Resuscitating Still-born Children*; London, 1859) is, however, generally regarded as decidedly preferable to that of Dr. Marshall Hall, although the same in principle. The following are Dr. Sylvester's rules, as slightly modified by a committee, whose investigations will be presently noticed. The patient is laid on his back on a plane, inclined a little from the feet upward; the shoulders are gently raised by a firm cushion being placed under them; the tongue is brought forward, so as to project a little from the side of the mouth. The operator then grasps the patient's arms just above the elbows, and raises them till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down, and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated; and these two sets of movements should be perseveringly continued at the rate of about 15 times in a minute.

Special reference must be made to two important documents among the publications on this subject. The first of these is the *Reports of the Scientific Committee on Suspended Animation*, presented to the royal medical and chirurgical society of London in July, 1862; and when it is stated that this report was signed by "C. J. B. Williams, chairman, W. S. Kirkes, George Harley, J. B. Sanderson, C. E. Brown-Sequard, H. Hyde Salter, E. H. Sieveking, and W. S. Savory, honorary secretary," its scientific claims to our attention are undeniable. The following are their suggestions in relation to treatment: 1. That all

* We regret that our limited space totally precludes us from noticing Dr. Smith's laborious investigations on the effect of different kinds of food and drink on the excretion of carbonic acid. The reader will find them described in several of the back volumes of the *Philosophical Transactions*.

obstruction to the passage of air to and from the lungs be at once, so far as is practicable, removed; that the mouth and nostrils, e. g., be cleansed from all foreign matters or adherent mucus. 2. That in the absence of natural respiration, artificial respiration by Dr. Sylvester's method (as already described) should be employed. 3. That if no natural respiratory efforts supervene, a dash of hot water (120° F.) or cold water be employed, for the purpose of exciting respiratory efforts. 4. That the temperature of the body be maintained by friction, warm blankets, the warm bath, etc. [whether the warm bath is serviceable or positively hurtful is, however, still an open question]; and 5. That in the case of drowning, in addition to the foregoing suggestions, the following plan may, in the first instance, be practiced: Place the body with the face downward, and hanging a little over the edge of a table, shutter, or board, raised at an angle of about 30°, so that the head may be lower than the feet. Open the mouth, and draw the tongue forward. Keep the body in this posture for a few seconds, or a little longer if fluid escapes. The escape of fluid may be assisted by pressing once or twice upon the back.

The other document to which we referred is entitled *Instructions for the Restoration of the apparently Dead from Drowning*, and was issued in 1864 by "The National Life-boat Institution." In these *Instructions* (a copy of which should be in the possession of every family), it is recommended, that if breathing cannot be excited by the application of stimulants to the nostrils, or by dashing water on the face, Marshall Hall's method should be tried; and that if this do not prove successful in from two to five minutes, Dr. Sylvester's method should be resorted to.

In conclusion, a reference must also be made to the *Reports of the Scientific Committee* [of the members of the royal medical and chirurgical society] *on the Uses and Effects of Chloroform*. The committee decide that the most certain means of restoring life after poisoning with anaesthetics is by artificial respiration. "By this means, resuscitating may generally be accomplished after natural respiration has ceased, provided the heart continue to act; and it may *sometimes* be effected even after the cessation of the heart's action. Galvanism resuscitates within the same limits as artificial respiration; it is, however, far less to be relied on in equal cases. Galvanism may be used in addition to artificial respiration; but the latter is on no account to be delayed or suspended, in order that galvanism may be tried."—*Proceedings of the Royal Medical and Chirurgical Society*, vol. iv. 1864.

RESPIRATOR is the name given by its inventor, Mr. Jeffreys, to an instrument which gives warmth to the air drawn into the lungs in breathing. It is attached to the mouth, and is composed of several layers of very fine wire, fixed so near together that the exhaled air passing through them is diffused over a very large amount of surface, its warmth being absorbed by the metal, which, being an excellent conductor of heat, freely returns it to the cold air, drawn in through it in the act of inspiration. Mr. Jeffreys considers it necessary that about 20 layers of metal-work should be used, and in order to make the instrument as light and compact as possible, each layer must be extremely thin. The apparatus usually consists of from 8 to 12 frames of sheet-silver or other metal, about $3\frac{1}{2}$ in. long, $1\frac{1}{2}$ in. wide, and $\frac{1}{200}$ th of an in. thick, the metal of which is pierced away by machinery so as to leave only a narrow framework, consisting of 6 vertical bars $\frac{1}{10}$ th of an in. wide, and 5 horizontal bars, with a width of $\frac{1}{10}$ th of an in. thick. To each side of each of these frames is soldered a layer of wires $1\frac{1}{2}$ in. long, and $\frac{1}{200}$ th of an in. thick. These wires are laid at about $\frac{1}{200}$ th of an in. apart, and are so numerous that a large respirator of high power contains 2,000 ft. of wire, divided into about 12,000 pieces, and soldered to the frames at more than 80,000 points. The frames, of wire-work, are fixed parallel to each other, and kept a small distance apart by small knots of a bad conductor of heat, so that the inner layers is always kept at almost the temperature of the expired air, and each successive layer diminishes in warmth, till the outer one is nearly as cold as the external air. By this arrangement, the air that is inhaled meeting with layers of wire of gradually increasing heat, is raised in the most powerful respirators to the highest attainable temperature. Such respirators have 24 layers of wire-work, those of medium power 16, and the weakest 8. The whole of the wire-work is curved, so as to fit closely to the face, and is inclosed in a border or case of soft leather; and an outer coat, usually of a very fine and open woolen fabric, is added. The form of instrument chiefly used is fixed over the mouth, and is named the *oral respirator*. For an instrument to cover both the mouth and nostrils, the term *ori-nasal respirator* is used. As defective and imperfect imitations of Mr. Jeffreys's respirator have been advertised, the original inventor has superadded the word *pneumocline*, or "climate for the lungs," to all the respirators for which he holds himself responsible. The use of these instruments in allowing persons with delicate lungs to take out-of-door exercise with safety and advantage in comparatively severe weather, is now universally recognized by the medical profession.

RESPIRATORY SOUNDS are of the greatest importance in the diagnosis of the diseases of the lungs. They may be divided into (1) those directly resulting from inspiration and expiration, and (2) those of the voice, including coughing.

In the healthy state of the lungs, two distinct sounds are heard, on applying the ear, either directly or through the intervention of the stethoscope, to the walls of the chest—one called the *vesicular sound*, because it is supposed to be caused by the passage of the

air from the ultimate tubes into the air-cells or vesicles; and the other the *bronchial sound*, because it is generated in the bronchial tubes by the air moving through them.

The vesicular sound, known also as the *respiratory murmur*, is mainly produced during inspiration, being very faint, and sometimes scarcely perceptible during expiration. It is rather a rustle than a murmur, and has been compared to the sighing of a gentle breeze among leaves, to the sound made in the deep inspiration of a sleeping person, etc.; but a single minute's application of the ear to the chest of a healthy person below the collar-bone, will give a clearer idea of its true nature than any mere description could convey. The sound is more distinct in thin than in fat persons, in women than in men, and in children than in adults. Indeed, it is so loud in children, that when an unusually noisy sound is heard in an adult, it is said to be *puerile*. The *bronchial sound* has a blowing character, such as may be produced by blowing air quickly through a tube, and is altogether distinct from the former. It may be most clearly heard over the trachea or windpipe, and at the upper part of the sternum or breast-bone.

Such are the sounds as they occur in the healthy lungs. In disease, any change which tends to impair the respiratory function in one part of the lungs, will make the vesicular murmur abnormally weak there, and abnormally loud in the remainder; and there are other changes, besides a mere increase or decrease of intensity, that sometimes occur, and into which we have no space to enter. The bronchial sound is also liable to morbid alteration; for example, it may be heard in parts of the chest where it is usually inaudible, in consequence of condensation of the surrounding pulmonary tissue, or from dilatation of the tubes, independently of condensation; and in violent dyspnoea, it may sometimes be heard over the whole chest without any change of structure. These morbid sounds are only modifications of those which occur in health. There are, however, other sounds generated by disease which are highly important in diagnosis. These are termed *râles* by the French, and *rattles, sibilus, rhonchus*, etc., by those English writers who do not adopt the French term. They may be briefly divided into the *dry* and the *moist râles*, the former being caused by the passage of the air, with increased rapidity, through narrowed portions of the bronchial tubes; while the latter are formed by the passage of air through a fluid of more or less tenacity in the bronchial tubes, causing the formation of a succession of bubbles, whose bursting occasions the sound.

There are two other morbid sounds connected with the respiratory system which deserve to be named in this list, viz., *metallic tinkling* and the *friction sound*. Metallic tinkling is a quick and sharp sound, resembling that produced by striking a glass vessel with a pin. Its occurrence affords evidence of the existence of a cavity of considerable size, containing air, and surrounded by firm walls; but how the sound is produced is not definitely settled. The friction sound is produced by the rubbing together of the pulmonary and costal pleura when rough from inflammatory action, and is indicative of pleurisy.

RESPOND, in Gothic architecture, a half-pier attached to a wall, and supporting an arch, etc.

RESPONDENT is the name of the party against whom another party presents a petition to a court which requires to be answered. The word is used in Scotland as well as in England, but more frequently in England.

RESPONDENTIA is a mode of raising money by a master of a ship in critical and desperate circumstances, when he has no other means of doing so, and when the object is to rescue or save the ship and cargo for the benefit of all parties. He goes to a person who advances a sum of money, and takes a mortgage of the goods or cargo, but in such a way that if the goods never arrive, the creditor loses his whole security, and cannot claim repayment from the owner of the ship. When money is borrowed in a similar way on the security of the ship itself, it is called *bottomry* (q.v.). In both cases the security is in the form of a bond.

RESPONSORIES (Lat. *responsorium*, a response), short sentences, generally verses or portions of verses from scripture, which are assigned in the church services, to be answered by the people to the officiating clergyman. Responsories are appended to lessons, to chapters, and to versicles, in common with which they are either chanted or simply repeated, according to the nature of the service. They are found in all the ancient liturgies, and occur also in the book of common prayer. In the latter the name given to them is **RESPONSE**; but in the ancient service-books, as well as in the modern breviary, they are called as above.

REST, in heraldry, the name usually given to a charge, varying considerably in different representations. It appears at too early a date to be what it is often said to be—a spear-rest. It is sometimes called an organ-rest, and in old rolls, a clarion—and is most likely a representation of some musical instrument like the pandean pipe. It was a rebus-badger of the Clares.

REST, in music, an interval of silence occurring in the course of a movement between one sound and another. The duration of a rest, like the duration of a note, is indicated by the form of the character representing it.

Semibreve	Minim.	Crotchet.	Quaver.	Semiquaver.	Demi-semi- quaver.	Semi-semi- quaver.	Two Semibreves.	Four Semibreves.	Six Semibreves.	Eight Semibreves.

For rests of a still longer duration, it is now usual to draw one or two oblique lines across the staff, and write on them in figures the number of measures during which the

voice or instrument is to be silent. Thus, in common time, denotes a rest

of 13 semibreves. A rest, like a note, may be prolonged by one or more dots.

REST-HARROW, *Ononis*, a genus of plants of the natural order *leguminosæ*, suborder *papilionaceæ*, having a 5-cleft bell-shaped calyx, the standard of the corolla large and striated, the keel beaked, the pod turgid and few-seeded. There are many species, chiefly natives of Europe, and generally herbaceous or half-shrubby.—The COMMON REST-HARROW (*O. arvensis*) is abundant in pastures and by waysides in Britain. Its lower leaves have three leaflets, the upper are simple; the flowers are axillary and rose-colored, or occasionally white. The plant is half-shrubby, with somewhat spiny stems; viscid; and its smell strong and unpleasant. The roots are tough and woody, whence its English name. It is sometimes a troublesome weed, but only in neglected pastures, and disappears before careful cultivation.

RESTIA CÆÆ, a natural order of endogenous plants, nearly allied to *cyperaceæ*, mostly natives of the southern hemisphere, and abounding at the Cape of Good Hope and in Australia. They are herbaceous plants, or sometimes half-shrubby, have simple stems, and narrow leaves; and are hard, wiry, and rush-like. They have generally a creeping root-stock. The flowers are in heads or spikes, generally unisexual, with 2 to 6 glumes, sometimes with none, 2 or 3 stamens, an ovary with 1 to 3 cells, 1 ovule in each cell, the fruit a capsule or nut. *Restio tectorum* is much used for thatching houses at the Cape of Good Hope. *Widdenovia teres* is used for making baskets and brooms.

RESTIGOUCHÉ, a river in the n.w. of New Brunswick, Canada, forms for about 50 m. the boundary between that province and the province of Quebec. It is 200 m. in length, and falls into Chaleur bay, which opens into the gulf of St. Lawrence. For the last 18 m. it is navigable for the largest ships.

RESTIGOUCHE, a co. in n. New Brunswick, having the bay of Chaleurs and the Restigouche river on the s. and s.e., drained by the Matapédia and numerous small rivers emptying into the bay; 2,889 sq.m; pop. '71, 5,575. The intercolonial railway skirts its n. border. Its surface is composed of mountains, covered with a dense growth of timber, and valleys which are fertile by the water courses, but very little cultivated. The exportation of lumber is the principal business, and it has a large trade in preserved salmon and lobsters. Co. seat, Dalhousie.

RESTITUTION, in Scotch law, is the obligation of the purchaser of a movable, which really belongs to a third party, to deliver it up to such real owner without claiming repayment of price. An action lies to recover restitution of money paid in mistake. See REPETITION.—In English law the word restitution is used in similar circumstances to denote delivery up of possession to the rightful owner. Thus, in case of goods stolen, the criminal court may order restitution of the goods to the owner.

RESTORATION, a term applied in English history to the resumption of monarchical government, on the accession of Charles II., May 29, 1660, after an interval of 11 years from Jan. 30, 1649, when Charles I. was beheaded, during which the government of Great Britain was republican. The restoration was appointed by various statutes to be observed as a festival in the church of England, with special religious services; but its observance was abolished in 1859 by act 22 Viet. c. 3.

RESTORATIONISTS, a sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q.v.). One of the most remarkable doctrines of that father was his belief of a general *apokatastasis*, or "restoration" of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favor of God, and reunited to him in heaven. This doctrine was condemned at the time, and has since been repeatedly rejected by the churches of the east as well as of the west. The doctrine has been renewed in more than one form since the reformation by various classes, who have taken the name of Universalists (q.v.). The particular title of Restorationists was given in America to the followers of a preacher named Ballow, who, in addition to the tenet above explained, held that all retribution is confined to this life, and who, although he denied the immortality of the soul, yet taught that at the resurrection all men will be admitted to everlasting happiness. The Restorationists are said to exist chiefly in Massachusetts.

RESURRECTION. This expression denotes the revival of the human body in a future state after it has been consigned to the grave. We find traces of this doctrine in other religions, and especially in later Judaism, but the doctrine is peculiarly Christian. In the earlier Hebrew Scriptures there is no mention of it. It is not to be found in the Pentateuch, in the Psalms, nor even in the earlier prophecies. It is supposed to be alluded to in Isaiah (xxvi. 19), and in Ezekiel (xxxvii.) in the well-known chapter as to the revival of dry bones in the valley of vision; and in the last chapter of Daniel (xii. 2) there is the distinct affirmation that "many that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt." There is also a well-known passage in Job (xix. 25-27) which has been thought by some to refer to the doctrine of the resurrection of the body. Almost all recent criticism, however, denies the validity of this reference, as unsupported by a correct rendering of the words themselves; and especially by the whole scope of the argument of the book, which confines its view of retribution to the present life. The idea of a future resurrection would have presented to the mind of the patriarch a more conspicuous solution of the enigmas of Providence which perplexed him, and could not have failed to be introduced into the argument by some of the speakers, had it formed an element of their religious knowledge; but they nowhere allude to it. It is only, therefore, in the later Judaism that the doctrine appears. In the time of our Lord it had become a formal doctrine of the Pharisees. The general body of the Jewish people seem also to have believed in it. The Sadducees alone disputed it (Matt. xxii. 23, sq.; Luke xx. 27, sq.; Acts xxiii. 6-8). It appears, in fact, to have become bound up in the Jewish mind with the idea of a future life, so that an argument which proved the one proved the other; and the Sadducees not merely denied the distinctive idea of the resurrection, but further denied that there was any "angel or spirit."

It remained for Christ and his apostles to reveal clearly the doctrine of the resurrection of the body, and to connect it with the fact of Christ's own resurrection as its special evidence and pledge. The following may be stated as the main points involved in the doctrine as revealed in the New Testament: 1. The resurrection of the dead is ascribed to Christ himself; it will complete his work of redemption for the human race (John v. 21; 1 Cor. xv. 22, sq.; 1 Thess. iv. 14; Rev. i. 18). 2. All the dead will be raised indiscriminately to receive judgment according to their works, "they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation" (John v. 21-29; 1 Cor. xv. 22; Rev. xx. 11). 3. The resurrection will take place at the "last day," by which seems to be meant the close of the present world (John vi. 39, 40, xi. 24; 1 Thess. iv. 15). 4. The great event is represented as being ushered in by the sound of a trumpet, a representation probably borrowed from the Jewish practice of convening assemblies by sound of trumpet (1 Cor. xv. 52; 1 Thess. iv. 16). 5. As to the character of the change through which our bodies are raised after the lapse of ages, and get their identity preserved, there is nothing distinctly made known. The impossibility of such a change was evidently a subject of argument in the primitive Christian age, and the apostle argues strongly in its favor (1 Cor. xv. 32, sq.) from occurrences which are scarcely less mysterious in the natural world. It is not professed, however, that such occurrences really explain or throw light upon the fact of the resurrection. The apostle designs rather to silence cavils, and to invigorate faith, than to render an account of the actual manner of the resurrection. Arguing from God's infinite power as displayed in the processes of creation, he would, as it were, press the question which he asks elsewhere: "Why should it be thought a thing incredible with you that God should raise the dead?" (Acts xxvi. 8), rather than attempt any explanation of which the subject does not really admit. And this is the only becoming spirit in which this great doctrine can be contemplated by any mind. The fact of a resurrection of the dead is clearly revealed; but the *mode* of the fact necessarily transcends our present intelligence.

RESURRECTION (*ante*), in the signification of the word and the Scripture doctrine concerning it, implies that in some true sense the identity of the body will be preserved in the future life. As to what is necessary to constitute identity, various opinions are advanced. 1. The re-assembling of all particles that had ever been in the body. 2. The preservation of some, however few, from which divine power will construct a body adapted to the soul's higher condition. 3. The continued existence of a "vital germ." 4. The evolution of a "spiritual" body at the moment of death. 5. The existence of a formative principle of life which constantly gathers the matter which it needs for a body wherever it may be—this implies that the continuance of the vital principle constitutes identity, and that the principle of bodily organism, which now appropriates earthly materials, will at the resurrection have higher materials on which to act. 6. The entrance of the spirit into a new body to which it will impart the same personality as it had given to the old; personal identity, it is said, rests in the consciousness. There are several things taught in the Scriptures concerning the resurrection body of the righteous, the full meaning of which cannot yet be known. What is clearly revealed is that it will be: 1. Different from the buried body, as the plant is different from the seed sown; 2. Spiritual, in distinction from the psychical bodies of earth; 3. Incorruptible, glorious, and powerful; 4. Like the glorified body of Christ in heaven. Concerning the resurrection-body of the ungodly, Scripture is almost silent, saying scarcely anything more in relation to it than that the unjust also shall rise after death.

RETAINER is, in English law, the act of engaging an attorney or counsel to attend to a certain suit or case. The retainer of an attorney may be either verbal or in writing; but the retainer of a counsel is always by writing; i. e., by a written memorandum delivered by the attorney to the counsel. The retaining of a counsel is generally a precautionary measure resorted to only in the case of eminent counsel, the effect of it being to prevent the other party from securing the services of such counsel; and this is considered a prudent precaution in most cases of importance. The usual fee, however, must be paid over and above the retaining fee, which is a small fee varying with the court in which the litigation arises.

RETAINING WALLS. These, as their name implies, are walls built to retain earth, sand, or other incoherent substances in positions and forms which without their aid they could not maintain.

These substances, if left to themselves, will not stand with vertical sides, but will fall down till they assume a certain slope. The angle which this slope makes with the horizontal is called the "angle of repose." This angle varies according to the nature of the material; for example, that of moist soil is about 45°, while fine sand assumes an angle of about 30°.

In fig. 1, E represents a section of a mass of earth, which it is desired to retain by means of the wall ABCD.

FIG. 1.

If we draw BG from B at the angle of repose, it is evident, from what has been said, that the prism ABG is kept in position by means of the retaining wall; and if the earth began to give way, it would do so by slipping on some line, BF. The wedge-shaped piece, ABF, which has the greatest tendency to separate itself from the rest of the mass, is called the "prism of greatest pressure;" and the retaining wall ABCD must be made of sufficient weight and thickness to prop it up and resist its tendency to slide. The line BF is found to bisect the angle ABG.

In estimating the requisite thickness of the wall, it must be taken into account that the wall may give way in various manners; it may be overturned, or it

may slide as a whole along its base DB, or the upper parts may give way, while the base remains.

From these data, mathematical formulæ have been worked out, which determine the thickness requisite for different situations and materials, such as that given by M. Poncelet for ordinary materials, and within ordinary limits:

$$x = .285(H + h).$$

Where H, the height of the wall, and h, the additional height of the bank above the top of the wall, being given, x, the thickness of the wall, can be found.

These formulæ, however, are not of much practical value, on account of the varying nature of the data on which they are founded, and of the excess of strength requisite in all such constructions, to allow for causes of failure, which cannot be foreseen or provided for in the calculations. Practical experience is found to be the only safe guide in all such considerations.

Figs. 2, 3, and 4 represent sections of forms of retaining walls in common use. Figs. 2 and 3 are used in retaining earthworks, while fig. 4 is a common form of dock-wall.

In that shown by fig. 2, the thickness at the top is made from 2 to 3 ft.; the back is vertical, and the front is sloped out 1 ft. for every 8 ft. in height; so that the thickness increases with the height, in the same manner as the pressure of the earth, which it is required to resist.

The foundation is made of large stones, extending beyond the sides of the wall, so as to distribute the pressure on as large a surface as possible. It is also sunk for 2 or 3 ft. below the adjoining surface, so as to resist its tendency to slip on its base.

At its back are placed counterforts, C, which are built up with the wall, and are about 3 ft. long by 2½ ft. wide, placed from 8 to 10 ft. apart. These counterforts stiffen the wall like ribs; they put its center of gravity further back, and so resist the tendency to heeling or overturning; they also act advantageously in dividing the earth, and so diminishing the length of the mass, which can act together against the wall. This form of wall is very simple in construction.

The form of wall shown in fig. 3 is that which requires the least material; it also, on account of its thinness, dries and consolidates rapidly, but is not so easily built as that shown in fig. 2.

FIG. 2.

The dock-wall shown in fig. 4 is made much heavier than the simple pressure of the earth behind it would require; for it has many struts to bear of an exceptional character due to its situation; such are the machinery and goods deposited on the quays and the possible accident of the dock being suddenly emptied of water, while the earth behind the wall is full of water.

In the construction of a retaining wall, a great desideratum is, that the earth behind it be well drained; for if water be allowed to accumulate behind the wall, the earth gets

Fig. 3.

Fig. 4.

into a semi-fluid state, in which it gives a very much increased pressure on the wall. For this purpose, holes are left through the wall called "weeping holes;" these holes are about 9 in. high and 2 in. wide, and are generally placed about 1 for every 36 sq. ft. of wall. Also stones without mortar are frequently built up behind the wall, so forming an open stratum, into which the water drains, and is thence carried off through the weeping-holes.

RETENTION OF URINE is the term employed in medicine to signify a want of power to discharge the urine from the bladder, and it must be carefully distinguished from a far more serious affection known as *suppression of urine*, in which also no urine is passed, because in this case there is none in the bladder.

Retention may arise either from change of structure of the parts concerned in the expulsion of the urine, or from mere disordered function unaccompanied by change. The former are termed *organic*, and the latter *functional* causes of retention.

Among the chief organic causes are: 1. Permanent stricture of the urethra (q.v.). 2. Contraction of the urethra, in consequence of a blow on the perinæum, or other external injury. 3. Tumors within the urethra. 4. Foreign bodies in the urethra, as calculi, clots of blood, or mucus, etc., which have entered it from the bladder, or fragments of bougies, etc., introduced from without. 5. Enlargement of the prostate gland, especially in aged men. The treatment in retention from these causes must be entirely left in the hands of the surgeon.

The principal functional causes are: 1. Spasm of the urethra, often termed spasmodic stricture; and 2. Want of power in the muscular coat of the bladder and urethra.

Spasm of the urethra is most likely to occur in those who have a slight permanent stricture, or a urethra irritable from other causes. The spasm usually follows exposure to cold and wet, but it may likewise be excited by piles or other sources of irritation in the lower bowel, or by the use of cantharides either taken internally as a medicine, or absorbed from blisters applied to the skin. The patient finds himself unable to pass his water, although he has a great desire and makes strong efforts to do so. The bladder soon becomes so distended that it can be felt as a tense round tumor above the pubes. If relief be not speedily afforded, the bladder may burst, and discharge its contents into the peritoneal cavity, in which case death rapidly ensues; or the urethra behind the stricture gives way, and the urine is extravasated into the cellular tissue of the adjacent parts—a condition which, if not promptly relieved by surgical interference, is likely to be followed by gangrene, typhoid symptoms, and death.

If the symptoms are not very severe, and there is no evidence of old permanent stricture, a hot bath, combined with the administration of the tincture of muriate of iron, in doses of ten minims, taken every ten minutes in thin gruel or in barley-water, will often give relief. Sometimes a full opiate administered by the mouth, or preferably as an enema, or the inhalation of a few whiffs of chloroform, will, by allaying the spasmodic action, give immediate relief. If these means fail, surgical assistance must be at once procured, and the bladder evacuated by a catheter—an operation often requiring very delicate manipulation. If these means fail, which only happens when the spasm is associated with old-standing disease of the urethra, the surgeon must either puncture the bladder through the rectum, or above the pubes, or make an incision into the urethra either at or behind the seat of the stricture.

Paralysis of the muscular coat of the bladder may arise from the debility of old age,

from the depressed state of the nervous system in fevers of the typhoid type, from injury or disease of the head or spine, and from various other causes. In a temporary form, it is often a result of over-distention of the bladder from stricture or prostatic disease, and it sometimes occurs in the case of nervous sedentary persons, if they have allowed rather more than the usual time to elapse without evacuating the bladder. It should be generally known that retention of urine from paralysis is sometimes accompanied with dribbling away of the water, so that the retention might at first sight be mistaken for *incontinence* of urine. On examination, however, it will be found that the bladder is abnormally distended, and cannot be evacuated by the act and will of the patient.

In these cases, the urine must for a time be regularly drawn away by the catheter. General tonics, such as the cold-bath (or sometimes preferably the sitz-bath) and chalybeates, must be given to improve the general health; while medicines which are supposed to act locally on the mucous coat of the bladder or on the spinal cord, must be simultaneously administered.

A peculiar form of retention sometimes occurs in women of hysterical temperament, in which the will rather than the power is at fault. The treatment should here be directed toward the general hysterical tendency, rather than to this special manifestation of it.

RETFORD, EAST a small municipal and parliamentary borough and market t. in the county of Notts, on the right bank of the Idle, an affluent of the Trent, 138 m. n.w. of London by the Great Northern railway. West Retford, on the other side of the river, and connected with East Retford by a strong bridge of five arches, is a more modern and much smaller town. Tanning and coach-making are carried on to some extent. Pop. of municipal borough '71, 3,194; of parliamentary borough, which returns two members to parliament, and which includes several parishes and districts, 49,257.

RETHEL, a t. of France, in the department of Ardennes, prettily situated on the right bank of the Aisne. Woolen and other manufactures are carried on. Pop. '76, 7,364.

RETHEL, ALFRED, 1816-59; b. at Aix-la-Chapelle, France; studied art at Frankfort and Düsseldorf. After his return from study in Italy, in 1845, he painted for the city hall of Aix-la-Chapelle, four frescos of great size, illustrating the history of Charlemagne. He produced a few other works of merit, such as the "Dance of Death" and "Hannibal Crossing the Alps;" but in 1852 became insane.

RETI MO, a sea-port t. of the island of Crete, on its n. coast, 35 m. w. from Candia. The neighborhood is productive both of oil and wine. Pop. about 6,000, of whom two-thirds are Turks, and the rest Greeks.

RETINA. See EYE.

RETIREMENT, ARMY AND NAVY. A royal warrant introducing and regulating compulsory retirement from the army was issued in 1877. Voluntary retirement on half-pay is allowed to officers after not less than 12 years' service. Officers below the rank of maj., who have served in their present rank for seven years without promotion, are to be placed on half-pay after a total service of 20 years; majors after 27 years, and higher officers after varying periods. As to age, a col. who has not retired on other grounds, must, unless special exception be made, retire at the age of 63 years, lieut.col. at 60 years, maj. at 58 years, and officers of lower rank at 55 years—the pension varying according to circumstances. In the navy, officers are placed on the retired list at 65 years of age if admirals or vice-admirals, 60 for rear-admirals, 55 for captains, 50 for commanders, and 45 for lieutenants, with the option in each case of retiring 5 years earlier. Lieutenants and commanders are also retired compulsorily if they have not served for 5 years, captains after seven years, without service, and flag-officers after 10 years. In 1878 there were 2,110 naval and 218 marine officers on the retired list, costing £618,095. In the army there were 370 officers on retired full-pay, costing £132,000, and 1578 on half-pay, costing £280,000; but these numbers include nearly all staff-officers, and many on temporary half-pay on account of sickness, private affairs, etc. See PENSIONS, DISCHARGE; also SUPERANNUATION.

RETORT, a vessel employed by chemists for the purpose of distilling or effecting decomposition by the aid of heat. It may be made of glass, earthenware, or metal, according to the purposes for which it is to be employed.

Glass retorts are the most common, and their ordinary form is seen in the figure. They may be employed for the production of such products as do not require any extraordinary degree of cold for the condensation of their vapor—as, for instance, for the production of hydrocyanic or nitric acid. The globular vessel in which the neck of the retort is inserted is from its function termed the *receiver*. Cold may be applied to the neck of the retort—for the purpose of condensing the vapor—in various ways, as by the application of a cold wet cloth, by a current of water, or by a special apparatus known as *Liebig's condenser*.

In the accompanying figure a *Liebig condenser* is fitted on to the retort. A is the bulb of the retort, into which the matter to be distilled is inserted. It can be opened or closed

at will at the top by a ground-glass stopper. From the bulb the neck proceeds, and its termination is seen in the receiver, D. The condenser, BB, embraces the greater part of the neck of the retort. It consists of a glass tube, tapering from end to end, fixed in the center of a metal pipe, provided with tubes, so arranged that a current of cold water may circulate through the apparatus. By putting a few pieces of ice into the little cistern, E, the temperature of this water may be kept at 32°, and extremely volatile liquids condensed.

The retort may be heated in various ways—as by means of a lamp, or by placing its body in a sand-bath, or even in the fire; in the last case, the retort is usually protected by a coating of lute.

In ordinary cases requiring a higher temperature than glass could bear, earthen retorts are used; for the preparation of hydrofluoric acid, retorts of lead are employed; while for the preparation of strong sulphuric acid, platinum is the best material for the retort. Iron retorts are employed in the laboratory for the preparation of oxygen from black oxide of manganese and some other processes; and in gas-works, for the destructive distillation of coal.

Liebig's Condenser.

RETREAT, in military language, signifies a retrograde movement of a force, with the intention of avoiding an encounter with a hostile body in the front. The greatest exertion of talent is requisite in a gen. to conduct an able retreat, more depending on arrangement and coolness than even in the preliminaries of a battle. When the enemy pursue, if the retreat is not to degenerate into a rout, the retreating army must be covered by a powerful rear-guard, which from time to time must hold the pursuers at bay, while the artillery-train and baggage pass defiles, cross streams, and overcome other special obstacles. A strong retreat is made when the rear is formed by a line of solid battalions, of which alternate masses retreat, while those intervening face about and oppose the enemy; the latter afterward retreating between and to the rear of those which retreated in the first instance. The retreat is thus continued by alternate halting and falling back on the part of each corps.

RETRENCHMENT, in fortification, is a defensive work, comprising at least ditch and parapet within some other work of a fortress, and intended as a place of retreat for the defenders, whence they may prolong the defense, or capitulate after the faces of the work itself have fallen into the enemy's hands. The retrenchment bears a considerable resemblance to the *réduit* except that it is almost always of earth. Retrenchments are made in ravelins, and the re-entering *places d'armes* at the time of constructing those works. A retrenchment is thrown across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle will fall into the possession of the besiegers; these retrenchments are usually made when wanted. Such a retrenchment across the interior of the Redan at Sebastopol caused the sanguinary repulse of the British on Sept. 8, 1855.

RETRIEVER, a dog specially trained to go in quest of game which a sportsman has shot, and particularly useful in fatiguing ground or in marshy places. The retriever is generally cross-bred, the two recognized crosses being that between the Newfoundland and setter, which has the coat smooth and wavy, and that between the Newfoundland and water-spaniel, which has the coat curly. The favorite color is black. Spaniels, crosses of the terrier and spaniel, and terriers are also used as retrievers; and even fox-hounds, blood-hounds, and setters. The training requires much assiduity and patience, the dog being apt at first to be drawn from the proper quest by any water-rat or other creature that presents itself, and also to bite the game too hard, so as to injure it. A thoroughly trained retriever therefore commands a high price, being of great use to the sportsman. A high degree of intelligence is requisite in a retriever; it is very often the attached companion of its master, and an inmate of the mansion rather than of the kennel.

RETROGRADE. This is a term applied to the motion of the planets and comets among the fixed stars when they appear to move in the *reverse* order of the signs of the zodiac (q. v.). All the planets move in the same direction round the sun, and therefore their retrograde motions must be due to their motion relative to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde.

In the case of the planets, which is thus the only one we need consider, let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be,

as at P and Q , toward the same side of the sun. The inferior planet has of course the greater velocity; and therefore, if p and q represent their positions after the lapse of a given time (second, hour, day, etc), Pp is greater than Qq , and therefore the direction of the line pq (in which one is seen from the other) has rotated in the opposite direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i.e., if Q be Jupiter, and P the earth), it appears to move backward among the stars. When an inferior planet is between the earth and sun (i.e., if Q be the earth, and P Venus), it appears to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let p and r be their positions after a given time; then pr has turned from the direction PR in the

direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move directly when the sun is between it and the earth. Between these two opposite cases, there must, of course, be points at which the apparent motion is neither retrograde nor direct—then the planet is said to be *stationary*. This case occurs whenever, for an instant, the lines PQ and pq are parallel: that is, when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel, and toward the same side of the joining line.

RETZ, GILLES DE LAVAL, Seigneur de, 1396–1440; was prominent in the wars with the English. He was condemned and put to death for magic and various horrible crimes; being found guilty of enticing into his castle several hundred children, whom he forced to worship the devil.

RETZ, JEAN FRANÇOIS PAUL DE GONDI, Cardinal de, 1614–79; b. Montmirail, France, of a rich and noble family. By his father he was compelled to enter the church, with the intention that he should become archbishop of Paris, a position which had already been held by two members of his house. In his studies he displayed great brilliancy and penetration, but his private life was dissolute. He became connected with the comte de Soissons, and engaged to some extent in political intrigue; but, after the death of that nobleman, resumed his theological studies and was made coadjutor of the archbishop of Paris, his uncle, by Louis XIII. on his death-bed. He devoted himself to his duties with zeal, and gained great popularity by his profuse distribution of alms. On the breaking out of the faction of the Fronde (q.v.) he at first was of great assistance to the royal cause, but was distrusted by the court, and became at last the leader of the popular party, though he did not openly declare himself as such. Though ambitious, it was admitted that he acted in these troubles with dignity and moderation. In 1650 he was gained over by Mazarin and rewarded with a cardinal's hat. After the close of the war and the return of the court to Paris, in 1652, a mission to Rome was offered to Gondy if he would leave his see; he was still greatly distrusted by the royalists; and as he hesitated was arrested and imprisoned at Vincennes. He resigned his archbishopric, which he had attained on his uncle's death, and was allowed to retire to Nantes, whence he made his escape into Spain and repaired to Rome. Here he revoked his resignation and succeeded in bartering the archbishopric for profitable benefices. After some years of exile he became reconciled to Louis XIV. and returned to France, but abstained altogether from further political intrigue. He sold his estates, paid his debts, which were enormous, and devoted the rest of his life to works of charity and religion. His *Memoirs* are described by Voltaire as displaying an air of grandeur, an impetuosity and inequality of genius, which are the picture of his conduct.

RETZSCH, FRIEDRICH AUGUST MORITZ, an eminent German painter and engraver, was b. in Dresden, Dec. 9, 1779, studied at the academy of his native city, where he became a professor in 1824. Retzsch died July 11, 1857. He has acquired great celebrity by his illustrations in outline of the great German poets, Schiller, Goethe, etc.—those of Goethe's *Faust* being particularly well known, not only in his own country, but also in France and England. His illustrations of Fouqué's charming romances, *Undine* and *Sintram*, are singularly beautiful. Retzsch likewise executed several fine works, the subjects of which are taken from the classical mythology, as "The Child Bacchus asleep on a Panther," "Diana," "Love and Psyche embracing in the Clouds," "A Satyr and Nymph," "The Four Epochs of Human Life," etc. Among his other works of conspicuous merit are: "The Struggle of Light and Darkness," "The Chess Players," and "Fantasies." Retzsch ranks as one of the most original, thoughtful, and vigorous artists of modern Germany. His works display the presence of a strong, inventive, and cultured imagination, whose efforts at expression never degenerated into a weak sentimentalism. As a miniature oil-painter Retzsch was also very successful.

REUHLIN, JOHANN, also known by his Græcized name of *Capnio*, one of the first and most active promoters of Hebrew studies in Germany, whose labors and struggles in

no small degree helped to bring about the reformation, was born at Pforzheim in Baden, Dec. 28, 1455. He received his earliest education at Schlettstadt, and in 1473 was appointed traveling companion to prince Friedrich of Baden, in which capacity he visited Paris, made the acquaintance of the celebrated Wessel (q. v.), and studied Greek under Hieronymus of Sparta, besides assiduously practicing the composition of Latin. Two years later Reuchlin went to Basel, where he continued his study of Greek, and wrote his Latin dictionary, *Vocabularius Latinus Breviloquus Dictus* (Basel, 1478). In the same year he paid a second visit to France, studied law at Orleans (1479), and fought at Poitiers (1480), then returned to Germany, married, and set up at Tübingen as a teacher of jurisprudence and literature. Subsequently he was raised to the rank of a count of the German empire in 1492, and about the same time began the study of Hebrew under a learned Jew, Jacob Jehiel Loans, the imperial physician. In 1496 Reuchlin went to Heidelberg, where he wrote a satirical comedy entitled *Sergius, sine Capitis Caput*, directed against the unworthy Augustinian monk Holzinger, who had been made chancellor of Würtemberg. In 1498 he was sent to Rome by Philip, the elector-palatine, and delivered a Latin oration before the pope. While remaining there he applied himself more vigorously than ever to the study of Hebrew and Greek, and with such success that his Greek master, Argyropulus, exclaimed in wonderment at his proficiency: "Our persecuted Greece has taken refuge beyond the Alps." Reuchlin returned to Würtemberg in 1499. In 1506 appeared his *Rudimenta Lingue Hebraica*, a work of which he was justly proud. He made it, as he said in his preface, "without any foreign help," declares it to be "the first attempt to execute a grammar of the Hebrew tongue," and finishes with the Horatian boast, *Evergi monumentum are perennius*. His Hebraic studies, which embraced the post-biblical Jewish literature, were—in their consequences—the most important of his life, drawing him into bitter strife with learned Jews, Jewish proselytes, and the Dominicans, and directly and powerfully helping on the reformation. It was in the year 1510 that the struggle between light and darkness, as the Germans regard it, broke out. In that year Johann Pfefferkorn, a Jewish proselyte, in the true spirit of a renegade, called upon princes and subjects to persecute the religion of his fathers, and especially urged the emperor to burn or confiscate all Jewish books except the Bible. Reuchlin remonstrated, maintaining that no Jewish books should be destroyed except those directly written against Christianity. This tolerant attitude drew upon Reuchlin the enmity of the Dominicans, and particularly the inquisitor, Jakob van Hoogstraten. These enemies of Reuchlin held possession of the universities of Paris, Louvain, Erfurt, and Mainz; but all the distinguished and independent thinkers in Germany, were on the side of the brave and humane scholar. Among the *Reuchlinists*, as they were termed, we may especially mention the names of Ulrich von Hutten (q. v.) and Franz von Sickingen (q. v.), to the first of whom (in conjunction with Rubeanus, etc.) we owe the *Epistola Obscurorum Virorum* (q. v.), and to the second of whom Reuchlin owed his safety, for he threatened (1519) Hoogstraten and his monks with his most terrible vengeance if they did not cease to persecute "his teacher, Doctor Reuchlin, that wise, experienced, pious, and ingenious man." When the reformation was inaugurated by the burning of the papal bull (1517), Reuchlin instinctively felt that a crisis had come, and exulted in the heroism of Luther. "God be praised!" he said; "we have now got a man who will give them [the monks] mighty hard work." Luther, in a letter to Reuchlin (1518), tells the latter that he had longed to take part with him in his noble struggle, but had never found an opportunity. But the end of the scholar's troubles was not yet come. A quarrel broke out between Ulrich duke of Würtemberg and the Swabian league, in the course of which Reuchlin became a prisoner of duke Wilhelm of Bavaria, who, however, generously restored him his freedom, and in 1520 appointed him professor at the university of Ingolstadt. While here he received a call to Würtemberg, which he declined, but sent Philip Melancthon in his stead. In 1522 the plague broke out in Ingolstadt, and Reuchlin again withdrew to Tübingen, intending to devote himself exclusively to learned studies, but soon after he fell sick, and died at Stuttgart on June 30. Reuchlin's life has been written by Gehres (1815), Meyerhoff (Berl. 1830), and Geiger (Leips. 1871).

RÉUNION, ILE DE LA, one of the names which has been borne by the island described under the head of **BOURBON, ILE DE**. This last name it had borne till the French revolution, when it was called *Réunion*; in 1809 it received the name of *Ile de Bonaparte*; after the treaty of Paris (1814) it reassumed the name of *Ile de Bourbon*, and retained it till 1848, when it again took the name of *Réunion*, and by that name it still continues to be officially known.

REUS, a lively modern manufacturing t. of Spain, in the modern province of Tarragona, and 10 m. w. of the city of that name by railway. It is only about 5 m. from the seaport of Salou, with which it is connected by a canal. The older portion of Reus was founded as early as 1151, and consists for the most part of tortuous lanes; the modern portion consists of wide plazas and streets. The *mercado*, a sort of arcaded exchange, surrounded with shops, is the principal square. The prosperity of Reus dates from about the year 1750, when a number of English merchants settled there, and developed the resources of the district. A number of the inhabitants are engaged in agriculture, but the majority are employed in the manufacture of silk and cotton fabrics, soap, earthenware, casks, leather, machinery, and in the general trade of the town. Reus contains

50 establishments for cotton-spinning alone, 5,000 looms, and many silk-ribbon factories. It imports flour, sheep and cattle, timber and hides, and exports brandy, wines, nuts, almonds, oil, leather, etc. Pop. 24,500.

REUSS, the name of two sovereign principalities of Germany, between the kingdom of Saxony and the Prussian duchy of that name, and separated from each other by the circle of Neustadt, an outlying portion of the grand-duchy of Saxe-Weimar. Since the year 1616 the possessions of the house of Reuss have been divided between the elder and the younger lines. According to the *Almanach de Gotha* for 1878, the principality of Reuss-Greiz (the elder line) is 123 sq. m. in extent, and had, in 1875, 46,985 inhabitants. The chief town and seat of the government is Greiz (q.v.). The principality of the younger line is Reuss-Schleiz, area 320 sq. m.; pop. '75, 92,375. Capital, Schleiz (q.v.). Of both principalities the surface is hilly, being traversed by the Frankenwald, whose chief summits are upward of 2,000 ft. in height. The chief rivers are the Saale and the Elster, the valleys of which are extensive and well cultivated. Large tracts are covered with forests and in pasture, and cattle and timber are exported. By the constitution of 1867 Reuss-Greiz obtained some much-needed reforms. Patrimonial jurisdiction was abolished, the administration of justice put under the management of regular courts, and a form of representative government granted to the people (7 of the 12 members of the single chamber being elected by town and country). The existing constitutional form of government in Reuss-Schleiz dates from 1852; 12 of the 16 representatives are elected by the people. The population in both states is almost wholly Protestant, and is in justly prosperous.

REUT LINGEN, a t. of Württemberg, situated in a beautiful district, fertile in fruit and wine, on the Echatz, a feeder of the Neckar, 20 m. s. of Stuttgart. Its houses are old and picturesque; and it was formerly surrounded by walls and moats, the site of which, however, is now occupied by streets. The church of St. Mary, completed in 1345, and surmounted by a pierced tower 325 ft. high, which is considered the most beautiful in the kingdom, is a noble Gothic edifice. Woolen and cotton yarns are spun, and cloth, leather, cutlery, hosiery, etc., are manufactured. Pop. '75, 15,246.

REVALENTA ARABICA, a name given to a preparation which has long been sold as an empirical diet for invalids, extraordinary restorative virtues being attributed to it. It is, in reality, only a preparation of the common lentil, its first name being formed for disguise by the transposition of its botanical name, *ereum lens*. Its real value is about equal to good pea-meal, the constituents of 100 parts of each being as follows. *Lentil meal*, or *revalenta*—Water, 12.70; nitrogenous matter, 24.57; starch, 59.43; fatty matter, 1.01; inorganic matter, 2.29. *Pea-meal*—Water, 12.50; nitrogenous matter, 25.30; starch, 58.38; fatty matter, 1.20; inorganic matter, 2.52.

REVEAL, REVEL, the square ingoing of the sides and lintel, or arch, of doors and windows between the face of the wall and the framing,

RÉVELLAUD, EUGENE, b. France, about 1850; of Roman Catholic parentage; was devoted by his mother to the priesthood, but being averse to the vocation was permitted to enter the national schools and study law. As an undergraduate he gained the highest prize, and in the law school attained great honor. Having been received as a barrister he engaged in a brilliant course of journalism in connection with the provincial papers, and became absorbed in the discussion of the great public questions of the day. Among these he soon saw that the religious question is the one of paramount importance to France. "Religion man must have; philosophy, masonry, free-thinking, will not take its place. But where shall the proper religion be found?" The religion of Rome, in his judgment, was not that which France needs. And as he studied the subject, although not himself a Protestant, he became convinced that Protestantism was the element of national life for the lack of which the French revolution had proved a failure. France therefore must, he was persuaded, embrace the reformed doctrines if only from motives of self-preservation. In the book which he wrote advocating the change, he said: "The author is not a believer. Born and brought up in Catholicism, he is what people call a free-thinker. His book is not a work of religious propagandism, but an attempt at social preservation." Since that time, however, he has become a Christian believer; and, withdrawing himself in a great degree from other employments, devotes his time and talents to the work of spreading through France what he regards as the truth. Already he has traversed many parts of the country lecturing in theaters and public halls to immense throngs of eager listeners. In 1880 he visited the United States, presenting his cause and exciting great interest.

REVELLE, in an army, is the beat of drums at break of day, to warn the troops that the night is passed, and the sentries to forbear from challenging.

REVEL, or REVAL, a Russian seaport and fortress of the first rank, capital of Esthonia, one of the Baltic provinces, stands on a small bay of the same name, 238 m. w.s.w. of St. Petersburg. It is divided into the upper and lower towns. The former, occupying the top of a rocky ridge about a mile in circumference, is inclosed by old Gothic walls, and contains the cathedral, the castle, gymnasium, governor's residence, and the houses of the nobility. This quarter, generally called the Dom, is connected by a steep descent with the lower town, which extends to the sandy shore of the harbor. The existing

walls and fortifications were erected in 1360. It was long held by the Lithuanian order of knights; was made over to Sweden in 1562; bombarded by the Danish and Lübeck fleets in 1569; and besieged by Peter the great, and annexed to the Russian empire in 1710. In 1713 a naval harbor, in addition to the commercial harbor already existing, was founded. The commercial importance of the town is at present small. The chief articles of export are flax, linseed, rye, skins, corn, and potato-brandy, supplied by land from the governments of Esthonia, Pskov, and Livonia. The chief imports are salt, fruits, wine, and manufactured and colonial goods. Pop. '67, 27,325.

REVELATION is a familiar theological expression, commonly applied to the knowledge of himself which God has given us in holy Scripture. In itself, however, the word is properly, and of late years has been frequently used, not merely of the divine knowledge communicated to us in Scripture, but of all divine knowledge communicated through whatever source. Conscience and reason are in themselves modes of revelation, in so far as they witness to us of the divine laws which bind our moral life, and in harmony with which the health and happiness of that life can alone be found. History is also a species of revelation, unfolding, as it does, the same divine laws collectively in the race. Then nature reveals the divine power, wisdom, and goodness; and science, the interpreter of nature, in so far as it makes known the great laws governing the material universe, truly makes known the divine will to us. But it is with the Scriptures of the Old and New Testament that the idea of revelation has come to be especially associated. The holy Scriptures are undoubtedly in a special sense the medium of divine revelation to the human race. God has made known to us therein more fully and clearly than elsewhere his will and character. But at the same time we must not confound revelation, in its fact and essence, with the books of Scripture. These books are only the highest or most distinguished form or *medium* of revelation, which, in itself, and essentially, must always imply communication from one mind to another; and, in a religious sense, from the divine to the human mind. Scripture is, in its several books, the pre-eminent medium of this contact or interchange of the divine and human. It is the record of special communications which God made in time past to holy men, "who spake as they were moved by the holy Spirit." It *contains*, in short, a revelation for us: but the revelation is not the record, but the knowledge which the record conveys to our minds.

REVELATION OF ST. JOHN (*Apokálypsis Iōannou*), the last book of the New Testament Scriptures. It professes to be the production of St. John, traditionally known as "the Divine" (*ho theologos*). It has been a subject of dispute, however, whether St. John, the author of this book, is the beloved apostle, the author of the fourth gospel and of the three epistles, or not. Upon the whole, the balance of evidence and of authority seem to be in favor of the supposition that he is the same, although some distinguished names—Luther in the past, and Lücke among modern critics—have adopted the negative view of the question. The author's simple mention of himself by his name John; his description of himself as one "who bare record of the word of God, and of the testimony of Jesus Christ, and of all things that he saw," is held to indicate strongly an identity with the author of the gospel, who speaks of himself in similar language (John xix. 35). He writes from Patmos, and the apostle is the only John distinctly named in the early Christian history as an exile in Patmos. The authority, moreover, with which the writer addresses the seven churches in Asia is such as may be supposed only to suit an apostle. So far as historical testimony is concerned, the authority of the early Christian fathers—e.g., Justin Martyr, Theophilus of Antioch, and Irenæus, and Clement of Alexandria—all point to the apostle John as the author of the Book of Revelation. The date of the book is supposed to be the very close of the 1st c., 95-97 A.D., or the end of the reign of Domitian. We cannot here particularize the contents of the book, nor can we enter into any detailed statement of the different interpretations which have been given of it. It has been the subject of very varied and conflicting commentary. It has been stated that "not less than 80 systematic commentaries are worthy of note, and that the less valuable writings on the subject are unnumbered, if not innumerable." All that we can do here is to characterize the different schools, so to speak, into which the interpreters of this wonderful book may be arranged: 1. The *Præterist* school of interpreters, who look upon the Revelation as fulfilled in the past, and especially in the great conflicts of Christianity with Judaism and Paganism, and its triumph over them in the ages following the time in which it was written. To this class of interpreters belong, among others, Grotius, Hammond, Bossuet, Calmet, Eichhorn, Ewald, Lücke, De Weite, Stuart, Lee, Maurice. 2. The *Futurist* school regard the book, with the exception of the first three chapters, as referring to events yet to come to pass; and this view has been advocated, in modern times, by such writers as Dr. J. H. Todd, Dr. S. R. Maitland, Newton, and others. 3. What has been called the historical and continuous school of expositors, who regard the Revelation as a progressive symbolic history of the fortunes of the church from the 1st c. to the end of time. To this school of interpreters belong a host of eminent names, such as Mede, sir I. Newton, Viringa, Bengel, Faber, Elliot, Wordsworth, Alford, Hengstenberg, Ebrard, and others.

There are others, again, who are not disposed to allow any exact prophetic character to the book, but simply to regard it as a species of symbolical poem, setting forth the eternally-recurring principles of the divine government. The real fulfillment of the

Revelation, therefore, is not to be sought in any definite historical events, but in the vindication of these principles shadowed forth more or less in great historical crises, yet transcending all partial historical results. The grand symbolic imagery of the book has never found and will never find its exact counterpart in any earthly facts, but it finds its spiritual counterpart constantly in the career of the church—the unceasing conflict of truth with error, of righteousness with sin, of life with death, of the kingdom of God with the kingdom of evil, and will attain to its true realization only on the destined triumph of the former over the latter.

REVELATION OF ST. JOHN (*ante*), contains, I., an announcement of its symbolic character, and a benediction on those who heed its words; John's salutation to the seven churches of Asia; an account of his vision of Christ in glory, with the command to record what he saw; II. messages to the seven churches; III. visions of the glory of God in heaven; the book with seven seals; the lamb, as it had been slain, who alone was found worthy to open the mysterious books, and the adoration rendered to him. IV. Visions at the opening of the seals: (1) a conqueror on a white horse; (2) a warrior on a red horse; (3) a tax collector on a black horse; (4) death on a pale horse; (5) the martyrs in white robes; (6) destruction amid the hosts of heaven, and terror among the inhabitants of earth; four angels holding the four winds; the sealing angel, and the 144,000 sealed on their foreheads; the multitude who came out of great tribulation; (7) silence in heaven; seven angels with trumpets, and one with a golden censer; the 1st trumpet, followed by hail, fire, and blood; the 2d by a burning mountain cast into the sea; the 3d by a star falling on rivers and fountains; the 4th by the smiting of the sun, moon, and stars; the 5th by the locusts from the bottomless pit; the 6th by millions of horsemen from the river Euphrates; the mighty angel, and the little book opened; seven thunders uttered, but not written; the angel on the sea and land, the little book eaten; the temple measured; the two witnesses; the 7th trumpet, followed by triumph in heaven. V. Vision of a woman clothed with the sun, crowned with 12 stars, and having the moon under her feet; the red dragon waiting to devour her child; the child caught up to the throne of God, and the woman fleeing to the wilderness; war between Michael and the dragon. VI. Visions (1) of a wild beast rising out of the sea, holding the dragon's power and seat, with great authority; (2) another wild beast rising out of the earth, exercising all the power of the first that was before his eyes. VII. (1) The lamb on mount Zion, with the 144,000 sealed ones, the harps, and the new song; (2) a flying angel proclaiming the gospel and the judgment of God; (3) another angel crying "Babylon is fallen;" (4) a third denouncing judgment on those who worship the beast; (5) a voice from heaven pronouncing benediction on those who die in the Lord; (6) the Son of Man on a white cloud, with a crown of gold on his head, and a sharp sickle in his hand with which he reaped the harvest of the earth; (7) An angel with another sickle to gather the vine of the earth and cast it into the winepress. VIII. (1) The sea of glass, mingled with fire; (2) the seven angels with golden vials containing the last plagues; the 1st vial poured out on the earth; the 2d, on the sea; the 3d, on the rivers and fountains; the 4th, on the sun; the 5th, on the seat of the beast; the 6th, on the river Euphrates, and the 7th, into the air. IX. A woman, arrayed in purple and scarlet, and adorned with gold, precious stones, and pearls, having her name and character of abomination written on her forehead sitting on a scarlet colored beast, and drunk with the blood of saints and martyrs; the mystery explained and judgments on the woman and beast foretold. X. A great angel coming down from heaven, clothed with mighty power lighting up the earth with his glory, and proclaiming the fall of Babylon; (2) its destruction described, attended with lamentation on earth, and with joy in heaven. XI. (1) The marriage of the Lamb; (2) again a conqueror on a white horse, with his kingly name on his vesture. XII. (1) Satan bound and shut up in the bottomless pit for a thousand years; (2) the souls of martyrs living and reigning with Christ during this millennium; this explained as the "first resurrection" which saves from the "second death;" (3) Satan loosed out of his prison and going forth to deceive the nations, and gather them together to battle; (4) their defeat, and Satan's doom; (5) the final judgment. XIII. (1) The new heaven and new earth; (2) the bride, the heavenly Jerusalem; (3) the river and tree of life. XIV. The conclusion, containing the renewed testimony of Jesus; a summing up of gospel invitations; a warning against altering the prophecy; the Savior's promise, with John's response; and a gracious benediction from Christ pronounced on all.

The recounting of this series of sublime visions in which are mingled the earthly, the celestial, and the infernal powers, shows the vast mystery with which any interpretation of this book must deal.

REVELS, MASTER OF THE, OR LORD OF MISRULE, the name of an officer, who, in England, was attached to royal and other distinguished houses, whose function it was to preside over the amusements of the court, or of the nobleman to whose house he was attached, during the 12 Christmas holidays. This officer, sometimes called *master of the tents and revels*, became a permanent appendage to the English court in the reign of Henry VIII., and his duties included the keeping the tents and pavilions which accompanied the sovereign on a royal progress, as also the keeping the dresses and masks used

in entertainments given at court, and the providing of new ones when required. In queen Elizabeth's time, we find the mastership of the revels divided into several distinct offices. The office continued to exist till the reign of George III., when it was altogether discontinued.

REVENUE, PUBLIC. A state has a right to reserve part of the property of the citizens, or of the produce of the country, or to exact contributions from the citizens, to supply the expense of carrying on the government. It is also entitled to augment the riches of the state by taxing merchandize imported into or exported from the country, and by taking a small part of the things consumed. In the United Kingdom, this branch of the sovereign power is vested in parliament.

The revenue of the crown, in England, has been divided by Blackstone into two branches, designated ordinary and extraordinary; the former attached to the crown by hereditary right, the latter specially granted by parliament as a supply for national purposes. The so-called ordinary revenue was the more important of the two, in the early history of the country, consisting in a great measure of the rents of the crown-lands; but these came, in the course of time, to be dilapidated by alienation and improvident management; and what remains of the hereditary land and forestal revenue of the crown, is now intrusted to certain officers, called commissioners of woods, forests, and land revenues (see **WOODS AND FORESTS**), who act under the control of the treasury. From the diminution of the hereditary revenues of the crown, subsidies have become the chief source of supply, a circumstance constitutionally of great importance, as it has rendered the crown dependent on parliament for its ordinary support and existence.

The popular voice, in the matter of taxation, was admitted as early as the reign of Edward I., an act of that monarch declaring "that no tallage or aid shall be taken or levied without the goodwill and assent of the archbishops, bishops, earls, barons, knights, burgesses, and other freemen of the land." The laity were thenceforth taxed by the votes of their representatives. The lords spiritual and temporal voted separate supplies for themselves; and from the reign of Edward I., the clergy, as a body, granted subsidies, either as a national council of the clergy, in connection with parliament, or, at a later period, in convocation, till the disuse of this right in the reign of Charles I. As the commons increased in political importance, the subsidies voted by them became the principal sources of revenue, and they gradually assumed their present position in regard to taxation and supply, including the lords as well as themselves in their grants. Concurrently with parliamentary taxation, imposts were formerly levied by royal prerogative alone; but none of these survived the revolution 1688. A grant by the commons is not effectual without the ultimate assent of the queen and house of lords; the lords, however, cannot alter a bill of supply, though they may refuse their assent to it.

The royal speech at the opening of parliament requires the commons to make provision for the public service, and states that estimates will be laid before them. The commons, referring to the royal speech, resolve that a supply be granted. Sitting as a committee of supply, they consider what specific grants shall be voted; and sitting as a committee of ways and means, they deliberate on the manner in which the necessary funds shall be raised. When some progress has been made in voting the estimates, the chancellor of the exchequer brings forward, in the committee of ways and means, his annual statement, popularly known as the budget, embodying his views on the probable revenue and expenditure of the year. Apart from the services voted in detail by the committee of supply, there are some few permanent charges which the treasury is bound to defray from the consolidated fund, such as the interest of the national debt, the civil list, the annuities of the royal family, and the salaries and pensions of judges and some other public officers. When taxes are imposed or altered, the government begins to levy the new duties as soon as the resolutions for that purpose are agreed to by the house. A control is established over the expenditure of the supplies by the long-established practice of separating the custody of the public revenue from the function of payment, the former being vested in the exchequer, and the latter in the treasury, and the officers of the exchequer being empowered to refuse their sanction to any demand not in accordance with the determination of the legislature. By an arrangement effected by 4 and 5 Will. IV. c. 15, the public revenue is now paid into the bank of England, to the credit of the comptroller-general of the exchequer, an officer independent of the ministry, who can only be removed on a joint-address to the crown from both houses of parliament.

The principal sources of revenue are now the customs, the excise, the stamp-duties, the land-tax and house-duty, the property and income tax, the post-office and telegraph service, and the crown lands. The excise, stamps, and taxes have been placed, by 12 Vict. c. 1, under the control of a board called the "commissioners of inland revenue." The aggregate of the different sources of revenue is paid into a fund called the "consolidated fund," founded by 27 Geo. III. c. 47, which is chargeable with the interest of the national debt, and is mortgaged to raise an annual sum for the maintenance of the royal household and civil list (q.v.).

The following table exhibits the gross revenue and expenditure of the United Kingdom, in the year ending Mar. 31, 1876:

REVENUE.

Customs.....	£20,020,000
Excise.....	27,626,000
Stamps.....	11,002,000
Land-tax and house-duty.....	2,496,000
Property and income tax.....	4,109,000
Post-office.....	5,950,000
Telegraph service.....	1,245,000
Crown lands (net).....	395,000
Miscellaneous.....	4,288,693
Total revenue.....	£77,131,693

EXPENDITURE.

Public debt.....	£27,443,750
Civil list.....	406,841
Annuities and pensions.....	323,110
Salaries and allowances.....	97,930
Courts of justice.....	629,652
Miscellaneous services (ordinary).....	94,556
Army.....	15,077,468
Navy.....	11,063,449
Army purchase commission.....	501,638
Purchase of Suez canal shares.....	4,076,565
Miscellaneous civil services.....	13,119,364
Customs and inland revenue.....	2,694,393
Post-office.....	2,982,000
Telegraph service.....	1,022,000
Post-office packet service.....	884,054
Fortifications.....	250,000
Total expenditure.....	£80,871,770
Excess of expenditure over income.....	£3,740,087

In the financial year 1877-78 the income was £79,763,298; the ordinary expenditure amounted to £78,903,495, but under the vote of credit of six millions granted on account of the eastern crisis, an additional sum, three and a half millions of pounds, was expended.

In 1801 the gross revenue of Great Britain was £35,218,525, and of Ireland £2,919,217; in 1861-62 Great Britain raised £61,360,749, and Ireland £6,792,606. So that in 1801 the revenue was £3, 7s. per head of population, and in Ireland, 11s. 2d.; while in 1861-62, the amount per head was £2, 13s. in Great Britain, and £1, 3s. 5d. in Ireland. At the conquest, the public revenue of England is estimated to have been about £400,000; and in the reign of Henry VI., it had fallen to £65,000. Under Henry VIII., it rose to £800,000; and under Anne, at the union with Scotland, it was £5,700,000.

The revenue of British India for 1877-78 was given at £58,635,472, and the expenditure at £62,018,853. The revenue of France is about £109,000,000; of Russia, £70,000,000; of Austria, £54,000,000; of Italy, £60,000,000; of Germany (the empire), £22,000,000; and of Spain, £23,000,000.

REVENUE, PUBLIC (*ante*). The sources of revenue collected by the national government of the United States, and their amounts for the fiscal year ending June 30, 1880, were as follows:

From customs duties on foreign imports.....	\$186,522,064
“ “ fees, fines, penalties, and forfeitures.....	1,431,269
“ sales of public lands.....	1,016,506
“ “ other government property.....	282,616
“ internal revenue.....	124,009,373
“ tax on circulation, deposits, etc., of national banks....	7,014,971
“ Pacific railroad companies, arrears of interest.....	1,707,367
“ consular fees, etc.....	2,337,029
“ profits on coinage.....	2,792,186
“ revenues of District of Columbia.....	1,809,469
Miscellaneous.....	4,603,756
	\$692,257,554

The expenditures for the same period are classed under heads, and in gross amounts, as follows:

Civil—Congress.....	\$4,993,470	
Executive.....	6,374,913	
Judiciary.....	2,888,430	
Government of territories.....	169,360	
Sub-treasuries.....	338,666	
Public land-offices.....	541,203	
Inspection of steam-vessels.....	213,569	
Mint and assay offices.....	174,348	
Total civil.....		\$15,693,963
Interior department—Indians.....	\$5,945,457	
Pensions.....	56,777,174	
Total.....		62,722,631
Foreign intercourse—diplomatic and consular salaries and contingencies, relief and protection of American seamen, foreign claims commissions arbitration at Geneva, prisons for American convicts, international exhibitions and commissions, and miscellaneous.....		1,211,490
Military establishment, in which is included the improvement of rivers and harbors, some national surveys in the territories, the signal service, the support of soldiers' homes and national cemeteries, and soldiers' bounties.....		38,116,916
Naval establishment.....		13,536,984
Miscellaneous.....		37,808,075
Interest on the public debt.....		95,757,575
Redemption of " ".....		220,776,177
Premium on redemption of loans.....		2,795,320
Total expenditures.....		\$488,419,135
Cash in treasury, June 30, 1880.....		203,833,419
Expenditures and on hand.....		\$662,257,554

The following table shows the sources of revenue from imports in the customs department, on classes of articles paying more than \$500,000 duties:

COMMODITIES.	Quantities.	Values in dollars.	Rate of duty.	Duties collected in dollars.	Per cent of value, average.
Animals, living.....		3,675,518	20 per cent.	735,104	20.
Books, periodicals, and pamphlets.....		2,059,864	25 "	514,966	25.
Braids—straw goods.....		2,045,613	30 "	613,684	30.
Breadstuffs, including rice (total).....		7,414,444		2,558,677	34.50
Buttons and button molds.....		3,478,332	30 per cent.	1,043,500	30.
Chemicals, dyes, drugs.....		3,499,085		4,079,817	30.29
Cotton, manufactures of, total.....		25,723,252		9,976,418	38.78
Diamonds and precious stones.....		6,630,911	10 per cent.	669,091	10.
Earthenware and china.....		5,500,994		2,331,154	42.37
Embroideries.....		3,115,602	35 per cent.	1,090,460	35.
Fancy articles.....		5,205,363		2,140,483	41.12
Fish, sardines—quarter boxes.....	13,378,244	1,478,114	4 c. per box	601,088	51.04
Flax, including flens of all kinds.....		22,228,438		7,496,661	33.72
Fruits, dried and fresh, and nuts—total.....		12,695,779		3,401,413	26.79
Furs, and manufactures of.....		3,823,969		796,125	20.81
Glass, and manufactures of.....		5,139,285		2,111,368	54.76
Hemp, jute, and other fibers.....		9,900,000		2,164,148	21.81
Iron, and manufactures of.....		34,318,531	variable.	14,103,375	41.09
Steel, " " ".....		11,148,451		5,077,249	45.54
Leather, " " ".....		11,767,481		3,411,436	28.98
Paper, " " ".....		1,590,181		542,159	34.09
Salt.....		1,750,175		845,293	48.29
Silk, and manufactures of.....		31,460,547	50 to 60 p.c.	18,556,398	58.98
Spices, " " ".....		2,099,431	5c to 20c per lb.	1,166,238	55.55
Spirits, " " ".....		1,748,586	\$2 per gall.	2,785,610	159.30
Wines—champagnes.....		2,321,782		1,134,632	48.86
" " still.....		3,327,251		1,957,294	58.82
Sugar, molasses, and confectionery.....		77,039,788		42,210,410	54.78
Tin, and manufactures of (lbs.).....	369,435,844	16,524,500	1½c. per lb.	4,063,794	24.59
Tobacco, and " " ".....		6,179,138		4,681,460	75.76
Wood, " " ".....		6,159,085		1,336,951	21.70
Wool, raw or unmanufactured.....		17,913,666		7,374,216	41.16
Wool and worsted manufactured cloths, hosiery, and dress goods.....		30,521,194		21,025,349	58.77
Carpets and carpeting.....		1,313,352		828,805	63.86
Total import of dutiable goods.....		\$419,506,090		\$182,580,217	43.48

The following is a summary of internal revenue receipts from the principal sources, 1863-80 inclusive:

YEARS.	Spirits.	Tobacco.	Fermented liquors.	Banks and bankers.	Penalties.	Adhesive stamps.	Income and other taxes now repealed.
1863.	\$5,176,130	\$9,097,330	\$1,628,934		\$27,170	\$4,140,175	\$26,932,713
1864.	30,329,150	8,592,099	2,290,200	\$2,897,720	193,630	5,894,915	67,008,225
1865.	18,731,422	11,401,373	3,734,323	4,940,871	520,363	11,163,392	160,638,180
1866.	33,268,172	16,531,008	5,320,253	3,463,998	1,142,853	15,044,373	236,256,337
1867.	33,542,052	19,765,148	6,057,501	2,046,562	1,459,171	16,094,718	186,954,423
1868.	18,655,531	18,730,095	5,955,869	1,866,716	1,256,882	14,832,252	129,863,090
1869.	45,071,231	23,430,708	6,099,880	2,196,654	877,089	16,420,710	65,943,673
1870.	55,606,094	31,350,708	6,319,127	3,020,084	827,905	16,511,043	71,567,968
1871.	46,281,848	23,578,907	7,380,502	3,644,242	636,080	15,242,739	37,136,958
1872.	49,475,516	33,736,171	8,258,498	4,628,229	412,265	16,177,321	19,053,007
1873.	52,069,372	34,386,303	9,321,938	3,771,031	461,653	7,702,377	6,329,782
1874.	49,444,090	33,242,876	9,301,680	3,377,031	364,216	6,136,845	764,880
1875.	52,081,991	37,302,462	9,144,004	4,097,248	281,108	6,557,230	1,060,111
1876.	56,429,265	39,765,340	9,571,281	4,006,698	409,284	6,518,488	509,631
1877.	57,469,430	41,106,547	9,480,789	3,829,729	419,999	6,450,429	228,261
1878.	50,420,816	40,091,755	9,937,052	3,492,932	316,008	6,280,405	429,659
1879.	52,570,285	40,135,003	10,729,320	3,198,884	578,591	6,237,538	
1880.	61,185,509	38,870,140	12,829,803	3,350,985	383,755	7,668,394	

The total cost of collecting internal revenue for the year ending June 30, 1880, was \$4,505,842; net amount collected, \$123,981,916; percentage of cost to collection, .0363 per centum.

Revenues of the several states are derived from taxation of real estate and personal property; the taxes for state, county, and township, or municipal purposes, forming three distinct parts of the whole amount raised, but all subject to the provisions of the state law. In most states the tax for the support of the public schools is included in the state's taxes, but supplemented and added to by towns and cities, as a part of special town taxes. Generally the tax for the state's revenue is much the lightest part of the general tax, the county tax next, and that levied for municipal revenue often largely exceeds both the others. See NATIONAL DEBT, FINANCES, MONEY, TAXATION.

REVERBERATORY FURNACE, a furnace so constructed that matter may be heated in it without coming in direct contact with the fuel. It consists essentially of three parts—viz., a fire-place at one end; in the middle, a flat bed or sole, on which the material to be heated is placed; and at the other end, a chimney to carry off the smoke or fume. Between the fire-place and the bed, a low partition-wall, called a fire-bridge, is placed, and the whole built over with a flat arch, dipping toward the chimney. The flame plays over the fire-bridge, and is reflected, or *reverberated*, on the material beneath, hence the name. See LEAD.

REVERE, PAUL, 1735-1818; b. Boston, descended from Huguenot ancestry, learned of his father the trade of a goldsmith, and served as 1st lieut. of artillery in the colonial army at fort Edward, near lake George, in 1756. Subsequently he established himself as an engraver on copper-plate in Boston, there being then but four such engravers in this country. In 1766 he engraved a print representing the "Repeal of the Stamp Act," and another called "The Seventeen Rescinders," both very popular. In 1774 he published a print of "The Boston Massacre," and "The Landing of the British Troops in Boston." He was a member of the grand jury, which refused to accept the decisions of a judge appointed by the crown to act independent of the people. He furnished the paper money for the Massachusetts provincial congress 1775, and established a powder mill, after learning the art of making powder in Philadelphia. He was one of the Boston men who formed the "tea party" to destroy the tea in the harbor in 1773, and carried the news to New York and Philadelphia. April 18, 1775, by order of gen. Warren, he took the memorable midnight ride through Charlestown to Concord and Lexington, to warn the people of the approach of the British under gen. Gage, and displayed the signal lanterns in the steeple of Christ church, Salem street, in Boston. He was grand master of Freemasons. After the war he established copper rolling mills at Canton, Mass., and a foundry for casting church bells and cannon. In 1871 a part of Chelsea was set off and named in his honor.

REVEREND (Lat. *reverendus*, to be respected), a title of respect given to the clergy. In Roman Catholic countries, it is applied to the members of the different religious orders. In France, before the revolution, archbishops, bishops, and abbots were alike "most reverend." In England, deans are "very reverend;" bishops, "right reverend;" and archbishops, "most reverend." In Scotland, the clergy in general are "reverend," while it is the practice to apply "very reverend" to the moderator of the general assembly for the time being, to a synod, and to the principal of a university, being a clergyman. The general assembly itself is usually styled "venerable," but the address of the lord high commissioner begins with the words: "right reverend and right honorable."

The style reverend is generally adopted by, and given to, the clergy of the different dissenting bodies; but there have been instances in which some of them have repudiated it.

REVERIE has been defined the dream of a waking man; it differs, however, in many respects, from dreaming. In an exaggerated form, it is of rare occurrence; but when exceeding absence of mind, or abstraction from what is passing around, it is abnormal and unhealthy; and may, under all circumstances, be regarded as a phenomenon of an imperfectly constituted, if not of a diseased nervous temperament. It is, moreover, generally, and always at its commencement, under the control of the will. Reverie is apparently, in all cases, and exaltation of the faculty of attention: the mind may be occupied according to the age, character, pursuits of the individual, by calculations, profound metaphysical inquiries, by fanciful visions, or by such trivial and transitory objects as to make no impression upon consciousness, so that the period of reverie is left an entire blank in memory. The most obvious external feature marking this condition is the apparent unconsciousness, or partial perception, of external objects. In what may be designated the first stage, castle-building, this inattention is only apparent, as the surrounding scenery may enter into the illusion, and constitute a part of the romance. In the celebrated case of Hartley Coleridge, whose double life, indulged in for years, affords illustrations of voluntary creations ultimately extorting a degree of belief and expectation—from a field near his home burst forth a cataract, from which flowed a river; on the banks of this arranged themselves fertile fields, a populous region, divided into realms and kingdoms, governed by laws, having traditions, histories. "Ejuxria" was, in fact, an analagon to the world of fact, embellished by imagination. This cherished unreality was parted with reluctantly. A more advanced stage of the affection is where, independently of the will, and in opposition to the ordinary habits of the individual, and under peculiar circumstances, there occur a loss of cognizance of surrounding objects and relations, and a state of abstraction or brown-study, in which many absurd and incongruous things are said and done. Ludicrous examples of this state are witnessed where a man loses his way in his native town, forgets his own name, or retires to bed in the middle of the day. It is related that sir Robert Peel, utterly unobservant of the adjournment of the house of commons, and the departure of the members, remained on one occasion unmoved in his seat, plunged in a profound reverie, until the lights were about to be extinguished, and he was roused by the clerk of the house. In a third stage or form, the reverist cannot be recalled to active perception, loses individuality, and is absorbed in the contemplation of unreal, though self-suggested impressions. This is seen in such cases as St. Teresa, and in the trances of Mysticism, Quietism, Second Sight. —*Memoir of Hartley Coleridge*, Disraeli's *Life of Lord G. Bentinck*, Maury's *Le Sommeil et les Rêves*.

REVERSE, in numismatics, the side of a coin or medal which does not bear the principal device or inscription. There is, however, generally an inscription or device on the reverse; and when the lower part of it is markedly separated from the rest, it is called the **EXERGUE** (Gr. *ex ergou*, without the work), and bears a secondary inscription.

REVERSED, in heraldry. A term applied to a charge turned upside down.

REVERSION. When the enjoyment of money, or of any kind of property is postponed until, or contingent on, the happening of a given event or given events, the present right to the deferred benefit is called a reversion. When the emergence of the right is certain, and the date fixed, to ascertain the immediate or marketable value of a reversion, is a very simple calculation; for example, let it be required to know for what sum a man should sell the right to receive £100 payable ten years hence. Suppose that he expects to be able to improve the money for which he sells his right at five per cent. per annum, compound interest, then one obvious way to get an answer to the question is simply to calculate what sum annually accumulated at the assumed rate will in ten years amount to £100. The answer (see art. **INTEREST**) will be found to be £61, 7s. 10d. When the date of the emergence of the reversionary right is uncertain, the purchase, in an individual case, must always be a speculation; but if there are a sufficient number of such rights, postponed to events of which there are sufficient observations from which to deduce laws of average, then the marketable value is easily calculated: for example, it is required to know what is the immediate value of £100 payable certainly on the death of a man aged 60. Here the perpetuity divides itself into the present value of an annuity of the annual interest of the £100 on the life of a male aged 60, and the reversionary right which is to emerge when the life fails. Having then ascertained the former value, and deducted it from £100, the remainder will be the present value of the reversion. When an assurance company buys a reversion, it is simply buying that which it sells when it grants a policy of life assurance. In the former case, however, an office, to secure its expenses and profits, will assume a high rate of interest and a long life; in the latter case, for the same reason, it will assume a low rate and a short life. Where the reversion is contingent, problems arise whose solution requires the utmost skill on the part of the actuary; for instance, B, aged 30, wishes to borrow £100 on the security of a sum payable to him in the event of his surviving A, aged 58. Here the security being doubtful, it could only be rendered marketable by assuring a sum to be paid in the event of B dying before A; and there would remain the important question of what this sum should

be, so as to cover the loan and the premiums of assurance with yearly accumulations on both. This question will be found ably discussed in a paper by Mr. Lang in the *Assurance Magazine* for 1850, p. 18.—On the general subject, see the same work for 1851, paper by C. Jellicoe, Esq.; do. for 1855, p. 239, paper by Robert Tucker, Esq.

REVERSION is that right to property which remains after some particular estate has ceased which had been granted by the owner. Thus, if A has a life estate in B's property, and after he dies, the property returns to B, B is said to have the reversion, or to be the reversioner. The landlord of property let to a tenant is called the reversioner, because, the moment the lease determines, the whole of the property and possessions vest in him. In the sale of reversionary estates, owing to the want of a system of registration of deeds, great risk is incurred by the purchaser lest the property should be burdened by some rent-charge.

REVETMENT, in permanent fortification, is a retaining-wall of masonry built for the purpose of holding back the earth of which works are composed. The most ordinary position of revêtements is for the escarp and counterscarp of the ditch (see **FORTIFICATION**). The most important of these two is the escarp, which has to hold back the great mass of earth represented by the rampart, parapet, banquette, etc. It is usually of solid brickwork or stone, 5 ft. thick at the top, and sloping outward as it descends (on the ditch-side only) to the extent of 1 in 6. Prior to Vauban's time, the escarp revêtement was commonly raised to the top of the parapet; but as in this case the artillery of a besieger played on the top of the wall, and ruined it soon after the siege commenced, that engineer adopted the principle—thenceforth followed—of raising it no higher than the crest of the glacis, or about 7 ft. above the natural ground, leaving the parapet above of sloped earth only. When the main ditch is 24 ft. deep, the scarp revêtement will be about 30 ft. high. Additional strength is imparted to the revêtement wall by massive buttresses at every 15 ft., called *counterforts*, and these, again, are sometimes connected and strengthened by masonry arches outside the revêtement. The revêtement forms a terrible barrier to an assaulting party. In field-works, temporary revêtements may be made of timber, turf, hurdles, or other materials at hand.

REVIEW, in military parlance, is the inspection by the sovereign or some staff-officer of any body of troops in parade order. Reviews always comprise a march past the inspecting-officer in column, and a general salute in line; to these is frequently added a mock-battle, for the amusement of spectators, and the practising of the troops themselves in warlike maneuvers.

REVIEW. The name applied by common literary usage to such periodical publications as are made up of critical essays. See **PERIODICAL**.

REVISING BARRISTER is a barrister appointed annually by the English judges to revise the lists and settle who are the persons entitled to vote for members of parliament. For this purpose all England is subdivided into districts, and a barrister is appointed for each district by the judges of assize. Though the appointment is only for one year, yet practically the same person is reappointed for life. The barrister must be of three years' standing at least. The revision of the lists takes place generally between August and October of each year. There is an appeal from the decision of the revising barrister to the court of common pleas at Westminster.—Similar duties are performed in Scotland by the sheriff-substitute.

REVIVALS OF RELIGION. The term *revival of religion*, or more briefly, *revival*, is employed to denote an increase of faith and piety in individual Christians, particularly after a period of religious declension, and also an increase of religion in a community or neighborhood, both through the *revival* of those who are already religious, and through the *conversion* of the previously irreligious. In these applications, its use is countenanced by several passages of Scripture; the idea which it is intended to convey is, however, far more frequently suggested by passages in which the term does not occur. The idea of revival is more particularly connected with the system of "evangelical" doctrine, and particularly with that part of it which relates to the work of the Holy Spirit in the conversion of sinners.

What are commonly called revivals of religion may be described as religious movements or excitements extending, more or less generally, over a neighborhood, or sometimes over a country. By those who regard them as genuine, it is urged in their favor, that they are in accordance with what the Scriptures teach us to expect, and that we have instances of a similar kind recorded in the Scriptures themselves—both in the history of the Jews, and in the early history of the Christian church, particularly in the effusion of the Holy Spirit on the day of Pentecost, and afterward in connection with the ministry of the apostles when many were converted through a single discourse, or, in other cases, evidently within a short time. It is further urged that the promise of the effusion of the Spirit in "the latter days" was not completely fulfilled on the day of Pentecost, but relates to the whole period of the Christian dispensation, and that, according to many prophecies, we have reason to expect even more of it in future times than there has ever hitherto been, so that "a nation shall be born in a day, and the kingdoms shall be the Lord's." The reformation of the 16th c., and the more partial movements of the same kind which preceded it, are also regarded as essentially revivals of religion—the reforma-

tion itself the greatest which has taken place since the apostolic age. The great development of religious fervor in England in the 17th c., is, according to this view, to be considered as a revival, and the extravagances which attended it as mere excrescences, like those of the Anabaptists in the time of the reformation. The next great movement of the same kind was that in the first half of the 18th c., from which the Methodist churches originated (see METHODISTS). It was accompanied with many circumstances similar to those which have attended later revivals of religion. The term revival did not begin to be commonly employed till after this period; and the revival which took place in New England and other parts of North America about the same time was then and still is generally designated the *great awakening*. The beginning of this revival seems to have had no connection with the Methodist movement in England, although subsequently they became connected through Mr. Whitefield's visits to North America. The revival in New England, which began about 1734, under the ministry of the celebrated Jonathan Edwards at Northampton, and rapidly extended over great part of New England and New York, was speedily followed by similar religious movements in Scotland, not altogether independent of it. Such religious movements had not, however, been unknown in Scotland before, although very much confined to particular times and localities. In 1625 and some following years, there was a revival at Irvine, under the ministry of Mr. David Dickson—a minister of more than ordinary abilities and attainments, some of whose works have recently been republished—so considerable as to be noticed in many histories of the church of Scotland, and which, because it extended very much to the neighboring parish of Stewarton, and along the banks of the Stewarton Water—the people of that district frequenting Irvine on market days, and hearing Mr. Dickson's lectures—was contemptuously styled by its adversaries the *Stewarton sickness*. In 1630 several hundreds are said to have been converted at once, through a sermon preached at Kirk-of-Shotts by Mr. John Livingstone, then a young preacher, but afterward an eminent minister of the church of Scotland, and a sufferer for the cause of Presbyterianism. About the same time (1623-41), similar movements took place in Ireland under the ministry of Scottish Presbyterian ministers settled in Ulster, and to which the origin of the Irish Presbyterian church must in great part be ascribed. The Presbyterians of Scotland were thus in some measure prepared to acknowledge the revivals of the earlier part of the 18th c. as genuine, which began at Cambuslang—Mr. M'Culloch being minister of that parish—in 1742, and speedily extended to Kilsyth and other parishes in the neighborhood, as well as to Dundee and other places more remote. No similar movement, however, took place over the country generally; nor was there anything of the same kind again till the very end of the century, when a revival took place (1798-1800) at Moulin in Perthshire, of which Mr. Alexander Stewart was then minister. This was followed in a few years by a revival in Arran (1804-13), under the ministry of Mr. M'Bride. Other similar local revivals followed, not infrequently, and in parts of Scotland widely remote from each other, both in the Highlands and Lowlands; and also in other parts of Britain, particularly a very extensive one in Wales, resulting in the formation of the Welsh Calvinistic Methodist church, but not confined in its effects to those who became connected with that church. Local revivals also in some instances attended the ministry of evangelical ministers of the church of England.

In 1839 the attention of all Scotland was drawn to a religious movement at Kilsyth, which was followed by similar occurrences in a number of other places, more or less evidently connected with it. The first appearance of an unusual degree of religious feeling at Kilsyth was in the parish church, during a sermon by Mr. William C. Burns, a son of the minister of the parish, and afterward a missionary in China. The emotion of many of the congregation broke out in sobs and cries, so that for a time the preacher's voice could scarcely be heard. For months religion was the almost exclusive subject of interest to a great part of the inhabitants of the parish, and many meetings for public worship were held besides the ordinary Sabbath services, at which great emotion was often displayed. Among the other places to which this movement notably extended was Dundee, where Mr. W. C. Burns was then stately employed in the ministry of the gospel. After 1839 there were revivals from time to time in various places in Scotland; but none of great extent or interest there or elsewhere in the British islands for nearly twenty years. There had, meanwhile, been many revivals in America generally, indeed, confined to particular congregations, seminaries, or localities, but sometimes extending over considerable districts; and throughout at least the northern and middle parts of the United States, the idea had become familiar to the popular mind, that revivals of religion ought to be expected from time to time; from which naturally followed the belief, that means ought to be employed to produce them. From this resulted, in some cases, increased earnestness in preaching and prayer, with greater assiduity in the use of all the ordinary means for the promotion of religion; in other cases, direct endeavors to produce excitement, as by *camp-meetings*—assemblies of great numbers of people held in the open air, at which exciting addresses were delivered by preacher after preacher, to work upon the nervous sensibilities of the audience.

Nothing of this kind, however, attended the commencement of the great religious movement which took place in 1857 and in the two following years. Its origin is ascribed in part, to the thoughts and feelings awakened during a period of great commercial distress. It began in New England, particularly in Connecticut and Massa-

chusetts, and rapidly extended to New York and over the middle and western states. It was not generally attended with scenes of great excitement. Strong but calm religious feeling was its general characteristic. In the city of New York, almost every congregation received a great accession of members, and prayer-meetings were held for about an hour in the middle of the day, which were attended by great numbers of persons actively engaged in business. More than 2,000 places in the state of New York were reported as partaking of this revival. Not long after it began in America, a similar movement took place in the north of Ireland, not apparently connected in its origin with that in America, although certainly connected with it soon afterward, and promoted by the news brought across the Atlantic. It rapidly extended over the whole north of Ireland, and subsequently to many parts of Scotland, Wales, and some parts of England. As a rule, it was free from excitement, and characterized by little else than the intensity of religious feeling displayed. Another remarkable revival, which extended over the greater part of Great Britain in 1874-75, originated in the efforts of two American evangelists, Messrs. Moody and Sankey, and was characterized by the almost entire absence of sensationalism.

Revivals of religion have occurred also in other parts of the world. About fifty years ago a widespread movement of this kind took place in Switzerland, although not affecting more than a small part of the population anywhere. Under the ministry of Felix Neff, it subsequently extended to the Protestant districts of Dauphiné, and to the neighboring Vaudois or Waldenses, on the Italian side of the Alps. Similar religious movements have occurred in many parts of Sweden.

Revivals have been accounted for in very different ways; but in general, too evidently in mere accordance with the different religious views of those by whom the theories have been proposed. Some have attempted to explain the phenomena of religious excitement extending over wide districts, and rapidly spreading from one place to another, by the supposition of a kind of epidemic disease affecting the mind. Another opinion very prevalently entertained by those who do not see in revivals anything really good, is, that they are the result of endeavors to work upon the feelings. It is replied, that although this theory might be plausibly enough advanced, if only such things were considered as the camp-meetings of the American Methodists, it is far from being in accordance with the best ascertained facts as to many of the revivals which have taken place both in America and in other countries. It is certain that many of these have taken place without any apparent attempt to work upon the feelings, more than is ordinary and proper in the preaching of the gospel, and that the greatest display of emotion has often been connected with preaching of the most simple and sober kind.—By those who believe in the reality of revivals, as productive of a true increase of religion, they are generally ascribed to the operation of the Holy Spirit, to which, according to the “evangelical” scheme, the “conversion” of every individual soul is ascribed, and also all increase of faith and piety in the converted. Revivals have, however, often been regarded with doubt by many who believe in the whole doctrine of the work of the Spirit as generally held in the Protestant churches, but who look upon the excitement frequently attending them as inconsistent with the proper sobriety and solemnity of religion, and think the progress of religion ought rather to be expected to be gradual, and without very much to call particular attention to it at one time more than another. It is replied, that while a blessing on the regular use of ordinances may confidently be expected, if duly sought by prayer, there is yet much in scripture to favor the notion that particular seasons may be unusually marked by the evidence of it; and further, that revivals, when they take place, generally show the usefulness of the ordinary means employed for the promotion of religion, as they seldom occur among persons very ignorant of religion, but rather among those who have previously enjoyed the benefit of the most faithful ministrations. With regard to the excitement attending many revivals, it is argued that this excitement is not wonderful, if persons are suddenly impressed with a deep sense of their sins, of the danger of divine wrath, and of the importance of religion; and that it is in some measure also to be expected in those who are brought by a quick transition from deep distress to a full sense of forgiveness and the favor of God. Are we to be surprised, it is asked, if persons in such circumstances, after much effort of self-restraint, cry aloud in the congregation, or fall down, overpowered by their emotions? It is sometimes alleged by the opponents of revivals, as an objection to them, that much of the excitement manifested in them is merely hysterical; and some of their advocates have rashly denied that this is the case; others, admitting it, deny that it affords any just cause of objection, and maintain that hysterical excitement is natural and unavoidable in such circumstances, and however undesirable in itself, is a manifestation of the reality and strength of the feelings awakened. They acknowledge, however, also, that like similar excitement produced by causes which have nothing to do with religion, it may extend from one to another, even where the cause in which it originated does not operate; and they therefore refuse to see in it, considered by itself, any evidence of the religious or spiritual condition of the persons affected by it.

That much folly and extravagance have often been exhibited in connection with revivals of religion is freely admitted by many who are fully convinced of their reality; but this, they say, is also only what might be expected, as the occasion always seems a favorable and inviting one to persons whose zeal exceeds their discretion, and too often

affords opportunity for ignorant and self-conceited persons to thrust themselves forward as teachers and conductors of religious exercises.

It may be proper to advert to some of the practices which sometimes take place on occasions of revival, but which are disapproved by all except those who are filled with the desire of seeing excitement produced and increased. Among these is the bringing forward of persons in the character of new converts, to conduct prayer in public, and to address meetings, which they are often among the least capable of doing well. Another practice liable to much objection is the permitting of mere youths, under profession of Christian zeal, to converse in private with persons in distress of mind, especially when these are young persons of the other sex. A third objectionable practice is the calling upon those who are anxious about their salvation to come forward and occupy a place by themselves—or what are called in America *anxious seats*—that they may be individually conversed with, and that special prayer may be made for them, they being thus brought into a publicity which is undesirable. It is hardly necessary to refer to the absurdity of demanding—as has sometimes been done—a show of hands from those who are now resolved to give themselves to the Lord! With such uncommendable practices may be classed that of encouraging persons who have been of very profligate life to recount their own history, which has sometimes been carried so far that they have seemed even to glory in the enormity of their past wickedness.

Certain peculiar modes of expression, which might not unaptly be designated a kind of slang, have often come into use in connection with revivals of religion, with the unhappy effect of exciting disgust in many minds, and particularly among the most educated classes of society. Thus, in the revival of last century in New England, the subjects of the revival—in a certain state of their experience—were spoken of as being *filled*. In the recent revival in Ireland it was common to speak of those who fell down suddenly in congregations or in their own houses as *stricken*, and as the *stricken ones*. It was very common during the same revival to speak of individuals as having *found peace*; and this finding of peace was by some regarded as proof of conversion, or even as indicating the moment of conversion—all which was considered by many who fully believed in the reality of the revival, as unscriptural and delusive.

Among the evils acknowledged to attend revivals by those who believe them to be real, but who also believe that there is often much connected with them which is not the work of God, is the disposition to judge of the spiritual state of individuals, as converted or unconverted. *New converts*, especially when brought into undue prominence, are apt to become elated and self-satisfied, and even to regard themselves as the only true Christians, or as superior to those whose piety is of much longer standing than their own. This, however, is not always the case, and much depends on the judicious or injudicious conduct of the ministers chiefly concerned when a revival takes place.

We have endeavored to present this subject fairly to our readers; but it is evident that as to the opinion to be formed by any one, much must depend upon the general religious views which he entertains. As to mere religious excitement, however, and bodily affections resulting from it, many facts may be adduced to show, what might be supposed beforehand, that these may be connected with religious views extremely at variance. Excitement may be produced by religious views that are utterly false, as well as by those which are true. Heathenism has always abounded in it; Mohammedanism has much of it; and it has appeared in the church of Rome as well as in the Protestant churches. It is not necessary to do more than allude to the extravagances of the flagellants, and to the strange scenes of the dancing mania. Some of the small sects, also, which evangelical Protestants regard as most heterodox, seem to maintain their existence by a systematic working up of excitement.

The subject of this article has been treated in a multitude of publications, almost every revival which takes place calling forth new pamphlets, narrative and controversial. The works of Jonathan Edwards deserve the first attention of those who wish to study the subject; and much information as to the history of revivals will be found in Gillies's *Historical Collections relating to Remarkable Periods of the Success of the Gospel*. Reference may also be made to Mrs. Lundie's work on *Revivals in the British Isles*; and for the revivals in Scotland in the middle of the 18th c., to Robe's *Narrative of the Revival of Religion at Kilsyth, Cambuslang, and other Places, in 1742* (new ed., Glasgow, 1840). Edwards maintains the genuineness of revivals with perhaps more force of argument than any writer has since done; and most of those extravagances which have sometimes attended revivals down to the present time, might have been avoided if those whose religious views accord with his had more carefully studied his discriminating remarks and sober counsels. No work has yet been produced such as Edwards's in one of his letters expresses a strong desire to see—"a history of true, vital, and experimental religion, and enthusiasm, bringing down the history from age to age, judiciously and clearly making the distinction between the one and the other.

REVIVOR is a bill or writ by which a suit or action is kept alive in the English courts of equity or law, where one of the parties dies during its dependence.

REVOCATION, when used as a legal term, is the withdrawing or annulling of a deed or will which otherwise would be valid. A will is said to be always subject to revocation, even though the testator say in the most express language that it is not to be revo-

cable, because a will is supposed to be subject to the ever-varying occasions of life. On the other hand, a deed is not capable of revocation, and is in its nature final and irrevocable; but if an express proviso is inserted which reserves a power of revocation, then this is a valid power, and may be exercised, provided the directions of the deed are strictly followed.

REVOLUTION, in politics, any extensive change in the constitution of a country suddenly brought about. The two most important events in modern history known under this name are the English revolution of the 17th c. and the French revolution of the 18th. The former began in the early part of the reign of Charles I., with the struggle between that king and his parliament. In 1642 the struggle became a civil war, in which the parliament obtained the ascendancy, and brought Charles to the block in 1649. A republic followed, under the protectorate of Oliver Cromwell, which was succeeded in 1660 by the restoration of monarchy in the person of Charles II.; but the arbitrary rule of James II. brought the king and people again into antagonism; and James having fled the country, William III. was called to the throne under such conditions and safe-guards as secured the balance of the constitution.—The French revolution was a violent reaction against that absolutism which had come in the course of time to supplant the old feudal institutions of the country. It began with an outbreak of insurrectionary movements at Paris in July, 1789, including the destruction of the Bastille. On Jan. 21, 1793, king Louis XVI. was beheaded. The Christian religion was deposed, the sacredness of the republic and worship of reason solemnized, and a disastrous reign of blood and terror followed, which was brought to an end in 1794, when Robespierre himself suffered on the guillotine the fate to which he had condemned countless multitudes of his countrymen.

Among other important revolutions in the modern world are the American revolution of 1775, by which the United States threw off their dependence on Great Britain; the French revolution of 1830, which drove Charles X. into exile, and raised Louis Philippe duke of Orleans to the throne by the will of the people; as also the revolution of 1848, when France rose against Louis Philippe, and adopted for a time a republican form of government, the revolutionary contagion spreading temporarily over most of continental Europe. By the Italian revolution of 1859-60, the various minor sovereignties of Italy were driven into exile, and the whole of the peninsula became, with the incorporation of the Roman territories in 1870, subject to Victor Emmanuel. The third French republic was also established in 1870-71 by a revolution.

REVOLUTIONARY TRIBUNAL, the name specially given to the infamous court of judgment—the most extreme republican will scarcely affirm that it was a court of justice—instituted by the French convention in Mar 1793, on a motion made by Danton (q.v.), who considered that such a court had become necessary, inasmuch as the recent disasters that had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary government. Its members were chosen from the various departments, and their appointment was ratified by the convention. Their function was to sit in judgment on all persons accused of crimes against the state, and from their sentence, delivered with appalling promptitude, there was no appeal. During the “reign of terror,” when Fouquier-Tinville (q.v.) was “public accuser,” it acquired a horrible notoriety, abolishing soon almost all forms of justice, neither hearing witnesses on behalf of the accused, nor allowing him an opportunity of defense, but blindly executing the orders of the “committee of public safety,” which was merely a tool in the hands of Robespierre (q.v.).—In the provinces, similar tribunals, under the name of “revolutionary committees,” were established, the commissaries-general of which, as, for instance, Carrier (q.v.), shot or drowned *suspects* in crowds.

REVOLVER, in fire-arms, is a weapon which, by means of a revolving breech or revolving barrels, can be made to fire more than once without reloading. The invention is very far from new, specimens, with even the present system of rotation, being still in existence, which were manufactured at the beginning of the 17th century. Probably the first revolver to suggest itself was one in which several barrels were mounted on an axis, and made to revolve by the action of the trigger, so that their powder-pans came successively under the action of the lock. This principle was never entirely abandoned, and in the reign of George IV. was produced a pistol called the “Mariette,” which had from four to twenty-four small barrels bored in a solid mass of metal, made to revolve as the trigger was drawn back. At close quarters, such a pistol would doubtless have been useful; but its great weight and cumbrous mechanism rendered aim extremely unsteady.

Contemporaneously from the first with the revolving barrels, went the formation of a revolving chamber or breech, pierced with several cylindrical apertures to receive the charges. Being made to revolve, each motion brought a chamber into line with the one barrel, common to all, whereupon the weapon was ready for use. Numerous patents for this principle have been taken out, including one by the celebrated marquis of Worcester in 1661. Various improvements were made, especially in the mode of causing revolution, an American, of the name of Elisha H. Collier, patenting such a weapon in the United States and England about 1818. In 1835 col. Samuel Colt brought to a conclusion experiments of some years' standing, and patented his world-

renowned Colt's revolver, which was a great advance on all previous attempts, and is substantially still in use. Colt's revolver consists of one rifled barrel of considerable strength and a massive chamber perforated with six or seven barrels, which are brought into a line with the barrel by action of the trigger. Each chamber has its nipple for a cap, which is brought under the hammer by the motion which brings the chamber or breech-piece round. In the most recent form of this revolver, the capped nipple disappears, the cap being contained within the cartridge. The hammer is discharged by the trigger, and acts nearly horizontally in a forward direction. Under the pistol is a fixed lever-ramrod, which is used in loading the chambers. Besides all this, by withdrawing a bolt, which can be done in a moment, the entire breech-piece can be taken out, and replaced by another ready charged, so that by carrying a spare breech-piece, a person may fire twelve shots in less time than another could fire three if he had to load between the shots. Colt's revolvers are now extensively used in the naval and military services of America and Europe.

The principal rival of Colt's revolver has been the Deane and Adams revolver, although many more of various sorts have been patented in the interval. The "Deane" differed in that it could be fired by merely pulling the trigger without also raising the hammer with the finger, as in Colt's; but this was found to be so dangerous in practice that the inventors soon substituted an arrangement under which it could be fired either by the trigger or by raising the hammer; and lastly, they introduced the great improvement of a spur behind the trigger, which must be pressed by the middle finger, while the forefinger discharges the piece through the trigger. The revolver principle has also been successfully applied to the manufacture of a kind of revolving guns for small projectiles, which are really aggregates of small-arms. The Gatling gun, a revolver of this class, in which the several barrels turned round a common axis, was used during the American civil war. But the best known gun of this description is the French *mitrailleuse* or *mitrailleuse*, of which so much was heard during the Franco-German war. That most commonly used had a group of 25 barrels, surrounded by a bronze sheathing, and movable breech-piece; it was fired by means of a crooked handle or winch at the right-hand side. The range of such guns in a level plain is not great; but among fortifications, or in a narrow valley, they may be used with very deadly effect.

REVULSION, in medicine, a term synonymous with derivation (q.v.). See also COUNTER-IRRITANTS.

REWAH, a state of India, called also BAGHELKUND, lying between the north-western and the central provinces, subsidiary to the government of the latter, and having for its capital a town of the same name, which is 70 m. s.w. from Allahabad, and stands on the right bank of the Tons. The town has a pop. of about 7,000. It exhibits remains of former magnificence, but even the walls and the rajah's palace are much decayed. The state has an area of about 13,000 sq. m., and great part of it is well cultivated. The pop. is about 2,035,000.

REWARD, when used in a legal sense, means a sum of money awarded by a court or judge to a witness who has been instrumental in detecting crime. By an English act of parliament of 1827, whenever it appears to a court of assize that a person has been active in apprehending offenders charged with murder, or with feloniously shooting, stabbing, cutting, wounding, or poisoning, or with rape, burglary, house-breaking, robbery, arson, or cattle-stealing, or with receiving stolen goods, the court may order the sheriff of the county to pay to such person a sum of money, to compensate his expenses, exertions, and loss of time. So courts of quarter sessions may order a reward not exceeding £5. If any man happen to be killed while endeavoring to apprehend a criminal charged with any of these offenses, the court may also order a sum to be paid to the widow or child. The going to foreign countries to apprehend criminals, is not considered to be a proper ground for giving these rewards. Nor is ordinary stealing from the person a crime which is within the act. Sometimes persons whose property has been stolen inconsiderately offer a reward for its restoration, and persons offer to recover it for a sum of money. The following enactments of the statute 24 and 25 Vict. c. 96, are directed against this practice. Whoever corruptly takes any money or reward, directly or indirectly, under pretense of helping any person to any chattel, money, valuable security, or other property which shall have been stolen, embezzled, or illegally disposed of, shall be guilty of felony, and be liable to penal servitude for seven years, or imprisonment for two years. A person may commit this offense though he has no knowledge of or connection with the thieves. Moreover, whoever shall publicly advertise a reward for the return of any property stolen or lost, and shall in such advertisement use any words purporting that no questions will be asked, or that a reward will be given, without seizing or making any inquiry after the person producing such property, or shall offer or promise to return to pawnbrokers or others any money advanced on such stolen or lost property, shall forfeit £50; and whoever shall print or publish such advertisement, shall forfeit the same sum.

REWARDS FOR DISTINGUISHED MILITARY SERVICE are annuities—most commonly of £100 each—granted to meritorious officers in consideration of distinguished service. The officers to whom they are awarded are usually major-generals or colonels, though a few paymasters, quartermasters, and medical officers receive these annuities, which,

however, in their case do not always amount to £100. The officer holds the annuity until, being a general officer, he is appointed colonel of a regiment. The amount given to officers in 1876-77 was £21,700; to sergeants, £5,000, besides £840 for Victoria Cross-pensions, and £8,000 for gratuities for long service, etc.

REYKJAVIK. See ICELAND.

REYNARD THE FOX, the title of a celebrated epic fable of the middle ages, belonging to, and terminating the series of poems in which "beasts" are the speakers and actors. It is written in low-German, professedly by a Hinreck van Alckmer, "school-master and tutor of that noble virtuous prince and lord, the duke of Lorraine," and was printed at Lübeck in 1498, under the title of *Reineke Vos*; but German critics in general are disposed to believe that no such person as Hinreck van Alckmer ever existed—he is nowhere else mentioned in history, literary or otherwise—and that the real author is a Hermann Barkhusen, town-clerk and book-printer in Rostock, who, according to a common enough practice, sent his book into the world under a pseudonym. A Rostock edition appeared in 1517, which was long believed to be the earliest, until the discovery of a copy—the only one known to exist—of the older Lübeck edition in the Wolfenbüttel library by prof. Hakemann, who published it in 1711. Since then the work has been repeatedly republished in Germany—the best edition being that of Hoffmann von Fallersleben (Bresl. 1834; 2d edit. 1852), which is enriched with an "introduction," "notes," and "glossary."—At a comparatively early period, translations were made from the Rostock edition into high-German, that of Mich. Beuther (Frankf. 1544), though badly executed, passing through more than 20 editions. The high-German translation was retranslated into Latin verse by Hartmann Schopper (Frankf. 1567), and thus gradually found its way into other countries. Goethe translated the work anew into modern German hexameters with admirable spirit and freshness (Berl. 1794), and his translation has been charmingly illustrated by Kanlbach (Mun. 1847); later translations are those by Soltan (Berl. 1803) and Simrock (Frankf. 1845-52), both of which are executed in the measure of the original—i.e., rhymed iambic couplets. A Danish translation in verse by Herm. Weiger was published at Lübeck in 1555; a Swedish, at Stockholm in 1621—prose version, 1775.

This brief outline of the literary history of *Reineke Vos*, leads us to the second and even more important part of the subject. Was that work strictly an original product of the author's fancy, or was it merely the final form assumed by a wide-spread fable? Till Jakob Grimm published the results of his laborious researches, everybody supposed that the poem printed at Lübeck in 1498, by whomsoever composed, was the earliest literary embodiment, if not the direct source, of the fable; but that opinion is no longer tenable. Grimm has shown that, in one form or another, the "beast-fable" (Ger. *Thier-sage*) goes back to the remotest antiquity, and is a common inheritance of the Aryan or Indo-Germanic races—Hindus, Celts, Greeks, Romans, Slaves, Esthonians, Germans—and even the Finns; and he explains with great clearness the conditions of thought, intellectual and religious, under which such a literary form is developed. But all nations do not attain equal success in its cultivation, and it was among the Germans, particularly the Franks, that it attained its most complete poetical elaboration. Grimm is, however, inclined to think that the particular fable of *Reineke Vos* is of German rather than Oriental origin (although the Persian version of Pilpay's fables, entitled *Anvar-i Suhaili*, or the Lights of Canopus, translated by Mr. Eastwick, Hertford, 1854, contains a story strikingly similar), and that the Franks brought it with them to the Netherlands and to France, where (and not in Low-Germany) it first appeared. Grimm published, in the *Lateinische Gedichte des 10 und 11 Jahrh.* (Gött. 1838), some small pieces, containing the nucleus or germ of the fable, and showing how soon, in the hands of the verse-loving monks, it had been turned to didactic and satiric purposes. Somewhat later other stories make their appearance, bearing more or less on the history of Reynard, but none of them setting forth the fable in the same manner as we now have it—the two principal being *Isegrimus* (apparently the composition of an ecclesiastic in southern Flanders about the beginning of the 12th c., and containing two stories of the wolf) and *Reinardus* (also originating from a Flemish ecclesiastic named Nivardus, which, besides an expansion of the *Isegrimus*, contains ten new stories; its date is about half a century later). But while, in these clerical compositions, side-allusions to the papacy, to the discipline of the church, and to the then powerful and flourishing order of the Cistercians, are very noticeable, in the mouth of the Franco-Flemish people, on the other hand, the story kept itself free of such temporary phenomena, and gradually shaped itself into a style of pure epic satire, reflecting general human characteristics. Before the close of the 12th c., this purer and more epic form of the satire found its way into both German and Flemish literature. In the former, this happened about 1170, when Heinrich der Glichezare (i.e., Henry "the Feigner" = Inventor or Troubadour), a native of Alsace, wrote in High-German his *Isegrines nôt*; and again in Flemish, a little later, when a poet, whose name is scarcely known, wrote *Der Reinaert*, a work of the purest epic character, and far surpassing all its predecessors both in conception and execution. Both works were afterward redacted by unknown hands—the German about the beginning of the 13th c., when its redactor gave it the title of *Reinhart* (published by Mailáth und Köffinger, in the "Koloczaer Codex," Pesth, 1818; and again in a purer state, with all his valuable

historical investigations, by Jakob Grimm, *Reinhart Fuchs*, Berl. 1834); the Flemish, about the close of the 13th c., when it received the name of *Reinaert de Vos*, part of which appeared in Grimm's *Reinhart Fuchs*, but the whole of which was published by J. F. Willems (Ghent, 1836-50), at the expense of the Belgian government.—Meanwhile, in France, the number of poems in which fables about Reynard are set forth had mightily increased, but only the oldest among those which have survived (which only reach back to about the beginning of the 13th c.) display a pure epic character. In 1826 M. Méon published a collection, in 4 vols., of the stories extant in Norman-French, under the title of *Le Roman du Renart*, to which M. Chabaille, in 1835, added *Suppléments*, with various readings and corrections. The *Renart li Contrefet*, of an unknown poet of Champagne, has only been partially printed. From such sources sprung the French chap-books (*Volksbücher*), which came into vogue after the 15th century. How popular the fable became in France may be estimated from the fact that the German word *reinhardt* (old form, *raginohart*—i.e., "bold", or "cunning in counsel"), which merely designates the character of the fox, has entirely superseded the old Franco-Latin word *goupil* (from the Latin *vulpes*). The Swabian court-poetry of Germany had little in harmony with the "beast-fable," which was little cultivated while the former continued to flourish. In the Netherlands, on the other hand, it continued to keep its ground, but as the mediæval spirit of poetry declined, it passed into prose—e.g., *De Hystorie van Reinaert de Vos*, published in Dutch at Gouda, in Holland, in 1479; which, in its turn, was translated into English in 1481 by William Caxton—*Ilyer begynne thystorye of Reynard the Foxe*; republished, with a few changes, by W. J. Thoms (Lond. 1844).—Thus have we sketched in meager outline the history of the fable of Reynard the fox in different countries, and from internal evidence it is clear that the substance of the Low-German *Reineke Vos* of Hinreck van Alckmer or Hermann Barkhusen was derived from the Flemish sources already referred to. Its peculiarity consists in this, that it is the latest, best, and most complete of the whole series of poems about the fox, gathering up into itself, as it were, whatever scattered merits its predecessors possess, and presenting the whole in epic unity for the pleasure and profit of all future ages. The work now consulted by general readers is Goethe's version, of which an excellent translation into English heroic verse was made by T. J. Arnold, with illustrations by J. Wolf (Lond. 1855). For a critical appreciation of the fable, see Carlyle's "Essay on German Literature of the Fourteenth and Fifteenth Centuries" (*Miscellaneous Essays*).

REYNOLDS, a co. in s.e. Missouri; drained by the Big Black river; about 650 sq. m.; pop. '70, 3,756—3,733 of American birth. The surface is hilly, and heavily wooded. The soil is fertile. Corn, wheat, and oats, are the principal productions. Co. seat, Centerville.

REYNOLDS, or RAINOLDS, JOHN, D.D; b. England, 1549; educated at Oxford; ordained, and in 1593 became dean of Lincoln; in 1598 was president of Corpus Christi college, Oxford. He was a man of vast learning, a great Hebraist, and made translations which he read to the king; and to him is due King James's version, he having urged upon the king the necessity of revising the Scriptures. He was a very copious writer.

REYNOLDS, JOHN FULTON, b. Penn.; graduated at West Point, 1841; distinguished himself at Monterey and Buena Vista, and, after the Mexican war, in Indian campaigns. Promoted for his services, he had attained the rank of lieutenant-col. at the beginning of the rebellion, and was then made brig. gen. of volunteers; was present at Mechanicsville and Gaines's Mill, and was captured. He was brevetted col. and brig. gen. for gallantry. After his release he commanded a division at Manassas, and at Fredericksburg led the 1st corps. He was killed at Gettysburg while leading the left wing of Meade's forces against Lee's army, leaving a high reputation as a soldier.

REYNOLDS, JOSEPH JONES, b. Ky., 1822; graduated at West Point, where he was assistant professor 1846-55. He was professor of mechanics in Washington university, St. Louis, 1856-60. He served through the rebellion, taking part in the campaign in West Virginia, and in the battles of the army of Cumberland. He commanded the department of Arkansas 1864-66, and was brevetted major U. S. army in 1867.

REYNOLDS, SIR JOSHUA, P.R.A., is generally acknowledged to be at the head of the English school of painting; he was b. on July 16, 1723. His father was the rev. Samuel Reynolds, rector of Plympton, St. Mary, and master of the grammar school of Plympton, Devonshire. He intended his son for the medical profession, but Joshua having manifested from an early age an ardent desire to be a painter, was, in 1741, placed under Hudson, the principal portrait-painter of the day. After being in the studio of this artist two years he commenced on his own account as a portrait-painter at Plymouth dock, now Devonport, and met with great encouragement. In 1746 he went to London and established himself in St. Martin's lane; but on the appointment of commodore Keppel to the Mediterranean station, he accepted an invitation to accompany him, sailed from Plymouth in 1749, and on his arrival in Leghorn, proceeded to Rome. He remained about three years in Italy, most diligently employing his time in visiting the various cities where the chief art-collections are to be found. On his returning to London in Oct., 1752, his works attracted great attention, eclipsing:

everything that had been done there since Van Dyck's time. When the royal academy was instituted in 1769 he was elected president; was knighted by George III., and on Ramsay's death, in 1784, succeeded him as painter to the king. He died in his house in Leicester square on Feb. 23, 1792, and after lying in state at the royal academy, was interred in the crypt of St. Paul's. Sir Joshua lived in friendly intercourse with Johnson, Burke, and the leading men of his period. His literary works consist of fifteen discourses delivered in the royal academy; three essays contributed to the *Idler*, at Dr. Johnson's request; notes to Mason's translation of Du Fresnoy's *Art of Painting*; a few notes for Dr. Johnson's edition of Shakespeare; and notes of his tour through Flanders in 1781. In his writings, there is much valuable information on art, imparted in an admirable manner; but he has been charged with laying down in them various rules and holding up the works of certain schools as models for the student, while he himself did not carry out these precepts in his practice as an artist; and from this an unfair inference has been drawn, that from love of gain he cultivated portrait-painting the most lucrative branch of the profession, and recommended others to follow what is generally believed to be a more arduous but less remunerative path of art. But this accusation is most unjustly made—perhaps no other artist has handed down in writing so many practically useful maxims and observations on art. His works of this kind fortunately are numerous and bear a very high value. There are nearly 700 engravings from Reynolds's pictures; most of them admirably rendered in mezzotint.—*Northcote's Life of Sir Joshua Reynolds* (2 vols. 8 vo, Lond. 1819); *Cunningham's Lives of British Painters, Sculptors, and Architects* (Lond. 1854, vol. 1).

RHABDOMANCY. See DIVINING-ROD.

RHADAMANTHUS, a mythical personage, son of Zeus and Europa, and brother of Minos (q.v.). He settled in Bœotia, where he married Alcemea. So great was his reputation during life for the exercise of justice, that after death he was appointed a judge in the under-world, along with Minos and Æacus. His special function was to sit in judgment on the actions of all those who came to Hades from Asia.

RHÆTIA, a Roman province of Europe lying on the Alps, n. of Italy and e. of Helvetia, and probably bounded n. by Vindelicia, thus corresponding to parts of the modern Tyrol, the Grisons and Lombardy. The Athesis and Ænus (mod. Adige and Inn) were the principal rivers. The natives were chiefly engaged in herding sheep and cattle. They were a hardy and warlike race; but were conquered about B.C. 15 by the Romans under Tiberius and Drusus. What was known as Western Illyricum and Vindelicia were united in the province Rhetia. The chief town was Tridentum or Trent.

RHÆTIC BEDS, a series of strata forming the uppermost portion of the trias (q.v.), which are extensively developed in the Rhætian Alps. The British beds referred to in this group are more highly fossiliferous than any of the other members of the triassic period.

RHAMNACEÆ, a natural order of exogenous plants, consisting of trees or shrubs; often spiny; with simple, generally alternate leaves, and stipules minute or wanting. The flowers are small, generally green. The calyx is 4-5 cleft; the petals distinct, hood-shaped, or convolute, inserted into the throat of the calyx, occasionally wanting. The stamens are equal in number to the petals, and opposite to them; the disk is fleshy; the ovary is superior, or half superior, with two, three, or four cells; the ovules solitary. The fruit is fleshy, and does not open when ripe, or dry and separating into three parts. This order contains about 250 known species, natives of temperate and tropical countries, and very generally distributed over the globe. Some of them are used in dyeing (see BUCKTHORN and FRENCH BERRIES), some in medicine (see RED ROOT), and the fruit of some is pleasant (see JUJUBE); while *hovenia dulcis*, a native of China and Japan, is remarkable for the thickening of its flower-stalks after flowering, so as to form a succulent sweet red pulp, with a flavor resembling that of a pear.

RHAMPHASTIDÆ. See TOUCAN, *ante*.

RHAMPSINITUS, the Greek name of the Egyptian monarch Rameses III., first king of the 20th dynasty, and builder of the great palace at Medinat Habu. According to Herodotus, he placed two colossal statues of 25 cubits high in front of the w. vestibule of the Hephæsteum at Memphis. He was the richest of Egyptian kings, having amassed 400,000 talents, or £77,500,000—an incredible sum for that period. This wealth was, however, probably in jewels as well as the precious metals, for both are recorded on the walls of the treasury of Medinat Habu. To secure this enormous treasure he built a treasury of stone, one side of which adjoined the wall of his palace. In connection with this is narrated a story which rather resembles the tale of Ali Baba in the *Arabian Nights* than the sober narrative of history. The story was told by the Egyptian dragomen of the days of the Persians to the father of history, who naively doubts its veracity; but notwithstanding some of the German researches which attempt to connect it with Hellenic myths of the brothers Agamedes and Trophonios, it is believed to be essentially Egyptian. Rhampsinitus is said to have descended to Hades, and to have played at draughts with Isis, or Ceres, and he is so represented on the walls of his palace at Medinat Habu. His return was celebrated as a festival. Herodotus, who has inverted and confused the whole history of Egypt, calls Rhampsinitus the son of Pro-

teus, and predecessor of Cheops, placing him 16 dynasties earlier than he should be. According to Lepsius, he reigned about 1275 B. C. According to Diodorus, Rhampsinitus was called Remphis, or rather Rempsis (Ramses), and by Pliny Ramses, in whose reign Troy was taken.

Pliny *Hist. Nat.*, xxxvi. 8, 14, 2; Herodotus, ii. 121-24; Diodorus, i. 62; Champollion, *Not. Descr.*; Burton, *Eva. Hier.*; sir G. Wilkinson, *Manners and Customs*, i. p. 121, and foll.; Lepsius, *Einleit.* p. 299, and foll.

RHAPSODISTS (from Gr. *rhapto*, to string together, and *odē*, a song), in ancient Greece, were a class of persons who earned their bread by going about from place to place, reciting, in a sort of musical chant, the epic ballads of Homer and other ancient poets. They may be compared with the wandering minstrels of the middle ages; but there is this important difference, that the latter were generally the authors of the compositions which they sung. The rhapsodists were long a respected and venerated body, but lost their importance, and consequently their character, when the Homeric songs after being written down and perhaps woven together into their present form by the scholars at the court of Peisistratos, became generally known to the Greek world through the medium of manuscript copies. Each ballad, or at least as much as could conveniently be remembered and recited at one time, was termed a "rhapsody," whence the application of the term to the separate books of the *Iliad* and *Odyssey*, in which usage it is equivalent to the *Fytte* or *Canto* of Scott and Byron.

RHATANY ROOT. See RATTANY ROOT.

RHE'A. See NANDU.

RHÉA, a co. in c. Tennessee, having the Tennessee river for its e. and s.e. boundary; 450 sq. m.; pop. '80, 7,073—7,044 of American birth, 773 colored. Its surface is level in the e. and mountainous in the w., where it forms part of the Cumberland mountains, and is there mostly covered with forests of oak and hickory. Its soil is fertile, and adapted to the raising of corn, wheat, oats, tobacco, sorghum, dairy products, and live stock. Its mineral products are bituminous coal and iron ore. Among its manufactories are wool carding, cloth dressing mills, and shoe factories. Co. seat, Washington.

RHEEA FIBER, an exceedingly valuable East Indian fibrous material, produced by one of the nettle tribe, *urtica tenacissima*, found indigenous in Assam. It is very nearly like the fiber of which the Chinese make their celebrated *grass cloth*, or lincn, and excepting that there are at present some difficulties in preparing it, it would at once become one of the most useful and most abundant of textile fibers; large quantities have already been imported into Britain, and it is gradually getting into use.

RHEGIUM. See REGGIO (in the province of Reggio).

RHEIMS, or **REIMS**, a city and archiepiscopal see in the department of Marne, France, situated on the Vesle (a tributary of the Aisne), 107 m. e.n.e. of Paris, by the Paris and Strasburg railway. Rheims a very ancient city, is built on the site of *Durocororum*, which is mentioned by Julius Caesar (*De Bello Gallico*, vi. 44) as the capital of the Remi, from which people it subsequently took its present name. Christianity may have found an entrance into Rheims at an earlier period, but it was not till the middle of the 4th c. that it became a bishop's see. Under the Frank rule it was a place of much importance, and it acquired a deeply religious interest from its having been the scene of the baptism of Clovis and his chief officers by the bishop, St. Remy, in 496. In the 8th c., it became an archbishopric, and from the 12th c. (in 1179, in which year Philip Augustus was there solemnly crowned), it became the place for the coronation of the kings of France down to the time of Charles X., a vessel of sacred oil, called *la sainte ampoule*, to which a miraculous origin was ascribed, being preserved for the purpose. The only sovereigns in the long series down to the revolution of 1830 not crowned at Rheims were Henry IV., Napoleon I., and Louis XVIII. During the frenzy of the revolution, the cathedral was attacked by the populace, and the *sainte ampoule* destroyed in detestation of royalty; and in 1830 the ceremony of coronation at Rheims was abolished. Rheims is one of the principal entrepôts for the wines of Champagne, and the hills which surround the town are planted with vineyards. It is one of the great centers of the woolen manufacture in France, and its manufactures, embracing woolen goods, mixed fabrics in silk and wool, merinoes, etc., are known in commerce as *articles de Reims*. The town is well built, and from the material employed in building, which is the chalk-stone of the district, and from the prevalence of the older style of domestic architecture, has a picturesque appearance. Its most striking public building is the cathedral, which, although it still wants the towers of the original design, is one of the finest extant specimens of Gothic architecture. It was built in the first half of the 13th century. Its nave is 466 ft. long by 99 in breadth, with a transept of 160 ft., and the height is 144 ft. Its grandest features are the western front, which is almost unrivaled, and the so-called angel tower, which rises 59 ft. above the lofty roof. The stained glass is remarkable for its beauty; the baptismal fonts also are of exquisite workmanship, and the organ is reputed one of the finest in France. The church of St. Remy is of greater age, and nearly of equal size, but it is of less architectural pretension. **The**

archiepiscopal province of Rheims comprises the sees of Soissons, Chalons, Beauvais, and Amiens. Pop. 76, 80,098.

RHEINGAU, a district stretching along the right bank of the Rhine, formerly belonging to the archbishopric of Mainz, now forms the administrative district of Wiesbaden, in the Prussian province of Hessen-Nassau. Rheingau is about 12 m. long, and 6 broad. This district, one of the richest in Germany, protected by mountains from the n. and e. winds, and exposed to the mid-day sun, produces wines of the best quality.

RHEIN-HESSÉ. See HESSE-DARMSTADT.

RHENISH ARCHITECTURE, the style of the countries bordering on the Rhine when the arts first revived after the fall of the Roman empire. Being, at the time of Charlemagne, part of the same empire with Lombardy, the arts of that country (see **LOMBARD ARCHITECTURE**) soon spread northward, and similar buildings sprung up n. of the Alps. There are almost no traces of architecture in Germany before the time of Charlemagne. It received great encouragement from him and his successors, and the Rhenish style made great progress up to the beginning of the 13th c., when the fashion of copying the Gothic architecture of France superseded it. It is, however, a well-marked style, and is complete and perfect in itself. Like the Lombard style, it is round-arched and has some remarkable peculiarities. The earliest churches seem to have been all circular (like the Dom at Aix-la-Chapelle, built by Charlemagne), and when this was abandoned, the circular church was absorbed into the basilica, or rectangular church (see **ROMANESQUE ARCHITECTURE**), in the form of a *western* apse. Most German churches thus have *two apses*—an eastern and a western. They also have a number of small circular or octagonal towers, which seem to be similar in origin to the round towers of Ireland. They exemplify in a remarkable manner the arrangements of an ancient plan of the 9th c., found in the monastery of St. Gall, and supposed to have been sent to the abbot, as a design for a perfect monastery, to aid him in carrying out his new buildings. The arcaded galleries at the eaves, and the richly-carved capitals, are among the most beautiful features of the style. Examples are very numerous from about 1000 to 1200 A.D. The three great types of the style are the cathedrals of Mainz, Worms, and Speyer. The last is a magnificent building, 435 ft. long by 125 ft. wide, with a nave 45 ft. wide and 105 ft. high. It is grand and simple, and one of the most impressive buildings in existence. There are also numerous fine examples of the style at Cologne—the Apostles' church, Sta Maria in Capitulo, and St. Martin's being amongst the most finished examples of Rhenish architecture. The peculiarities of plan and elevation above referred to are embodied in the church at Laach, which also has a paradise or pavis in front of the entrances. The vaults in this case being small, the different spans were managed (although with round arches) by tilting the springing; but in great buildings like Speyer and Worms the vaults are necessarily square in plan, in this round-arched style, and the nave embraces in each of its bays two arches of the side aisles—a method also followed by the early Gothic architects. From the use of the round arch and solid walls, the exteriors are free from the great mass of buttresses used in Gothic buildings, and the real forms are distinctly seen.

RHENISH CONFEDERATION. See CONFEDERATION OF THE RHINE, *ante*.

RHENISH PRUSSIA (Ger. *Rheinprovinz*, or *Rheinpreussen*), the most western and most thickly peopled of the provinces of Prussia, lies along the banks of the Rhine, and is bounded on the w. by Belgium and the Netherlands. Area 10,400 sq. m.; pop. '75, 3,804,381, of whom about 2,500,000 are Catholics, half-a-million are of Flemish blood, and 11,000 are Walloons. In the s., the surface is mountainous, the principal ranges being the Hunsrück, the Eifelgebirge, and branches of the Westerwald. The largest river is the Rhine, which flows through the province in a n.n.w. direction for 200 m., and receives many affluents from left and right. The surface is everywhere more or less mountainous, except in the extreme n., and the soil of the higher mountain-tracts barely supports the inhabitants; while that of the valleys of the Rhine, Moselle, and Nahe are very fruitful, and the flat districts in the n. are most productive in grain. Timber and minerals, including lead, copper, zinc, coal, etc., abound; and the warm and hot sulphur springs of Aix (q.v.) and Birtscheid (q.v.) have a European reputation. Industry and manufactures are here prosecuted with the utmost energy, and with great success. The cotton manufactures of the Wuppertal, the silk manufactures of Krefeld and vicinity, and the woolen cloth and Cashmere manufactures of the district of Aix, are famous. Rhenish Prussia came into the possession of Prussia by the treaty of Vienna in 1815. It consists of the former duchies of Cleves, Gelders, and Berg, of the principalities of Mörs and Lichtenberg, the northern and middle parts of the former archbishopric of Cologne, numerous lordships, portions from the four French departments of Rhein-Mosel, Mosel, des Forêts, and Saar, etc.

RHE-SUS MONKEY, *Macacus Rhesus*, an Indian monkey, extending further n. than any other species except the entellus (q.v.), or honuman, and, like it, partially migratory, visiting regions of the Himalaya in summer, which are far too cold for it in winter. It is held in almost as great veneration by the natives of India as the honuman itself; and the killing of one of these animals is apt to arouse the greatest popular indignation. The monkeys live in troops in the forests, chiefly in hilly districts, and visit the culti-

vated grounds to carry away grain and other produce, which they store up for themselves among rocks. The native farmers leave a share for the monkeys, believing this to be necessary for the averting of their anger, as otherwise, next year, they would destroy the whole crop whilst green. The rhesus monkey has a stout form, stout limbs, short ears, a short tail, large callosities, the skin hanging loose about the throat and belly, the hair rather long, the back brownish, the lower part of the back and the haunches bright chestnut, or almost orange, the shoulders and arms lighter. It is one of the most intelligent and mischievous of monkeys.

RHETORIC (Gr. *rhetorikē*, from *rhetor*, an orator) in its broadest sense may be regarded as the theory of eloquence, whether spoken or written. It aims at expounding the rules which should govern all prose composition or speech designed to influence the judgments or the feelings of men, and therefore treats of everything that relates to beauty or force of style—e.g., accuracy of expression, the structure of periods, and figures of speech. But in a narrower sense rhetoric concerns itself with a consideration of the fundamental principles according to which particular discourses of an oratorical kind are composed. The three chief elements of an oration are usually held to be—*inventio*, or the discovery of proper ideas; *dispositio*, or their arrangement; and *elocutio*, or the style in which they are expressed. The ancients, however, who cultivated oral eloquence more than the moderns do, reckoned other two—viz., *memoria*, or memory, and *actio*, or gesticulation. The most distinguished writers on rhetoric in ancient times were Aristotle, Cicero, and Quintilian; in modern times, Blair, Campbell, Whately, and Spalding among the English; Erneste Maass, Schott, Richter, and Falkmann among the Germans; and among the French, Rollin, Gibert, Le Batteux, La Harpe, Marmontel, and Andrieux.

RHEUMATISM (from the Gr. *rheuma*, a flux) is a blood-disease in which inflammation of the fibrous tissues is the most marked characteristic. It occurs either as an acute or as a chronic affection; there is, however, no distinct line of demarkation between the two, and the latter is often a consequence of the former.

Acute rheumatism is indicated by general febrile symptoms, redness, heat, swelling, and usually very intense pain, in and around one or more (generally several, either simultaneously or in succession) of the larger joints, and the disease shows a tendency to shift from joint to joint or to certain internal fibrous membranes, and especially the pericardium; rheumatism being the most common origin of pericarditis, as has been already shown in the article on that disease. The pulse is strong and full, there is headache, but seldom delirium, unless the heart is affected; the tongue is covered with a creamy thick fur, the tip and edges being red; the urine is turbid, and abnormally acid; and the skin is bathed in a copious perspiration, with so characteristic a smell (resembling that of sour milk), that the physician can often recognize the disease almost before he sees the patient. The joints are extremely painful, and the pain is much increased by pressure, and consequently by movement which gives rise to internal pressure. Hence the patient lies fixed in one position, from which he dares not stir. There are two varieties of acute rheumatism. In one, the inflammation commences not in the joint, but near it, and attacks the tendons, fascia, ligaments, and possibly the muscles themselves. This form is termed *fibrous* or *diffused* rheumatism. In the other variety, the synovial membrane in the joint becomes affected, and an excess of fluid is poured into the joint, distending the membrane, and making it bulge out between the spaces intervening between the various tendons, ligaments, etc., round the joint. It is the knee-joint which is most commonly affected in this way, and fluctuation may readily be perceived on applying the hands to the two sides of the knee. In this form, which is called *synovial* rheumatism, the swelling and redness come on sooner, and are more marked than in the former variety. The fibrous is by far the most severe form, and it is to it that the previous sketch of the most marked symptoms chiefly applies. In the synovial form, the fever is less intense, the tongue less foul, the perspiration far less profuse, and the membranes of the heart are much less liable to be attacked. It is to this form that the term *rheumatic gout* is often applied, and it is by no means inappropriate, because synovial rheumatism forms (as Dr. Watson has observed) a connecting link between gout and rheumatism, and partakes of the characters of both.

The only known exciting cause of acute rheumatism is exposure to cold, and especially to cold combined with moisture, and hence the greater prevalence of this disease among the poor and ill-clad. Sleeping in damp sheets or upon the damp ground, the wearing of wet clothes, and sitting in a cold damp room, especially if the sitter was previously warm from exercise, are examples of the kind of exposure which is apt to be followed by this disease. The excreting power of the skin being checked by the action of cold, certain effete matters which should be eliminated in the form of perspiration, are retained, and accumulate in the blood, which thus becomes poisoned. This blood-poisoning is not, however, a universal sequence to exposure to the cold. It only occurs when there is a special predisposition to this disease, or, as it is termed, a rheumatic diathesis or constitution, and the diathesis may be so strongly developed as to occasion an attack of acute rheumatism, independently of exposure to any apparent exciting cause. Men are more subject to the disease than women, but this probably arises from their greater exposure to atmospheric changes from the nature of their occupations. The predisposition is certainly affected by age; children under ten years, and adults over 60,

being seldom attacked, while the disease is most prevalent between the age of 15 and 40. Persons once affected become more liable to the complaint than they previously were. Dr. Fuller believes, from his observations made in St. George's hospital, that the disease is sometimes hereditary; whether this be the case or not, there can be no possible doubt that the predisposition is very apt to exist in members of the same family. The exact nature of the poison is unknown. The late Dr. Prout regarded lactic acid as the actual *materies morbi*, and certain experiments recently made by Dr. Richardson tend to confirm this view.

The danger in cases of acute rheumatism arises almost entirely from the disease going from the joints to the heart, and setting up pericarditis (q.v.). Hence that mode of treatment will be best which tends most surely to prevent, or, at all events, to lessen the risk of this complication. If the patient is a young person of robust constitution, and there are well-marked inflammatory symptoms (such as a flushed face and a bounding pulse), he should be at once bled from the arm. A large quantity of blood can usually be taken before any signs of faintness occur, and the bleeding is serviceable in at least three points of view. In the first place, it almost always mitigates the pain, and diminishes the febrile symptoms; secondly, it enables other remedies, as calomel, opium, colchicum, etc., to act more efficiently; and thirdly, it may occasionally cut short the attack of the disease, which, if not arrested by treatment, may run on for six weeks, two months, or even longer. Unfortunately, however, the cases of rheumatism which are fit to bear free venesection are comparatively few, especially in large towns; and further, it often happens that the physician is not called in till the proper time for free depletion is past. Purging is probably almost as efficacious as blood-letting, at the beginning of the disease. From five grains to a scruple of calomel given every night, and followed in the morning, for three or four days in succession, by an ordinary black draught, will sometimes dislodge an enormous amount of dark and foul secretions from the liver and bowels, and give marked relief. The main drawback to this mode of treatment is the pain occasioned by changing the position when the bowels act; but this may be to a great extent obviated by the use of the bed-pan. Opium (or morphia) is one of the most valuable remedies in this disease, from its power of allaying pain and procuring sleep. Dr. Corrigan of Dublin trusts to opium alone for the cure. He begins with one grain, and repeats that quantity (or a larger one if necessary) at intervals of two hours, until the pain disappears. He found 12 grains in the 24 hours to be the average amount required; but half that quantity (or even less) will generally suffice, if the opium be combined with other remedies, as, for example, if it be given with ipecacuanha (as in Dover's powder), or with small doses of calomel. Colchicum sometimes has a marvelous effect in subduing the disease, but it must be given with extreme care, in consequence of the prostration to which an over-dose gives rise. See Poisons. Dr. Watson believes that this remedy is of most value when synovial symptoms are present, or when, in other words, the rheumatism approaches in its characters to gout. "Large doses," he observes, "are not requisite. Twenty minims of the wine or of the tincture may be given every six hours until some result is obtained." The abnormal acidity of the various fluids (the sweat, urine, and even the saliva) in acute rheumatism has led to the belief that alkaline remedies would both neutralize the poison, and, from their diuretic properties, tend to eliminate it. The bicarbonate of potash in solution has been largely tried by Dr. Garrod, who administered it in average doses of two scruples every two hours, by night and day, for several days together. Of 51 cases so treated the average period of treatment was between six and seven days, and the average duration of the disease was slightly under a fortnight. The medicine soon rendered the urine alkaline, but did not irritate either the bladder or the intestines. It seemed rapidly to calm the pulse and to allay the febrile heat; and in no case did any heart-complication arise after the patient had been 48 hours under its influence. Other physicians, including the late Dr. Golding Bird, prefer the acetate of potash. The mode of treatment by lemon-juice in doses of 1 or 2 oz. five or six times a day, originally advocated by Dr. G. O. Rees, at first sight seems in direct antagonism to the alkaline mode of treatment. As, however, the most active principle in the lemon-juice is citrate of potash, which, before it reaches the kidneys, becomes converted into carbonate of potash, there is less essential difference between the acid and the alkaline mode of treatment than at first sight seems to be the case. Some years ago a new and wholly different mode of treating acute rheumatism was warmly advocated by Dr. Davies of the London hospital. It mainly consists in the application of a series of blisters to the parts surrounding and adjacent to the affected joints. One of our highest authorities on this disease, Dr. Fuller of St. George's hospital, after trying various hot external applications, finds that a mixed alkaline and opiate solution is far more powerful than any other in allaying acute rheumatic pain. The solution which he now usually employs is made by dissolving half an ounce (or rather more) of carbonate of potash or soda in 9 oz. of hot water, and adding 6 fluid drams of Battley's *liquor opii sedativus*. Thin flannel, soaked in this hot lotion, is applied to the affected joints, and the whole is wrapped in a covering of hot gutta-percha.

Cases which are intermediate between acute and chronic rheumatism are of very common occurrence. In those cases of what may be termed *subacute* rheumatism there is slight fever, and several joints are usually affected, without intense inflammation in any one joint. These cases soon show signs of amendment under a mild alkaline treat

ment, as, for example, a dram of liquor potassæ daily, well diluted and divided into three or four doses, and the moderate use of purgatives.

In all cases of acute and subacute rheumatism, the heart-sounds should be examined daily, or even oftener, with the view of detecting the earliest trace of cardiac affection, and, if possible, of checking its further development. For the treatment to be adopted when there is evidence that the membranes of the heart are affected, the reader is referred to pericarditis (q.v.).

There are two kinds of *chronic rheumatism*, which are sufficiently distinct to require notice. In one there is considerable local heat and swelling, although unaccompanied with any corresponding constitutional disturbance; while in the other the patient complains of coldness (rather than heat) and stiffness of the affected joints. The former approximates most closely to the previously described forms of rheumatism, of which it is frequently the sequel, and must be treated in a similar manner; while the latter, which is termed by some the *passive* form, usually occurs as an independent affection. In passive rheumatism the pain is relieved by friction, and the patients are most comfortable when warm in bed—conditions which increase the pain in the former variety. Patients of this kind derive benefit from living in a warm climate, from warm clothing, warm bathing, especially in salt water at a temperature of not less than 100°, the hot-air bath, etc. Friction with some stimulating liniment, and the peculiar manipulation known as shampooing, are here of service; and among the internal remedies, turpentine, cod-liver oil, sulphur, guaiacum, sarsaparilla, and Dover's powder possess a high reputation. Dr. Fuller recommends the muriate of ammonia as a remedy of "singular efficacy"; but of all remedies for this affection there can be little doubt that the most efficacious is the iodide of potassium, given in five-grain doses, combined with a few grains of carbonate of ammonia three times daily. A patient who is liable to attacks of chronic rheumatism should always wear flannel next the skin during the day, and at night he should sleep between the blankets, abjuring altogether the use of sheets.

RHEUMATIC DISEASES are less common in the lower animals than in men. Horses are not very liable to acute rheumatism, but suffer from a chronic variety, which occurs especially in conjunction with influenza. When affecting the limbs it often exhibits its characteristic tendency to shift from one part to another. In cattle and sheep rheumatic disorders are more common and acute than in horses. The specific inflammation sometimes involves most of the fibrous and fibro-serous textures throughout the body, inducing general stiffness, constipated bowels, and high fever. This is rheumatic fever—the chine-felon or body-garget of the old farriers. Sometimes the disease mainly affects the larger joints, causing intense pain, lameness, and hard swellings; occasionally it is confined to the feet and fetlocks, when it is recognized as bustian-foul. Cattle and sheep on bleak exposed pastures, and cows turned out of the dairy to feed on strong alluvial grazings, are especially subject to rheumatism in its several forms. Among dogs rheumatism is known under the name of kennel lameness, and is very troublesome and intractable in low, damp, cold situations. Blood-letting is rarely admissible except in the most acute cases among cattle. In all animals a laxative should at once be given with some saline matters and colchicum, and when the pain and fever are great, a little tincture of aconite may be added. For cattle, a good combination consists of 1 oz. of niter, 2 drams of powdered colchicum, and 2 fluid drams of the pharmacopœia tincture of aconite, repeated in water or gruel every three hours: half this dose will suffice for horses. With a simple laxative diet, dogs should have a pill night and morning containing five grains of niter and two of colchicum. Comfortable lodgings, a warm bed, horse-rugs on the body, and bandages on the legs, will greatly expedite a cure. In chronic cases, or after the more acute symptoms are subdued, an ounce of oil of turpentine, and two drams each of niter and powdered colchicum should be given for a cow, half that quantity for a horse, one-fourth for a sheep. Hartshorn and oil, or other stimulating embrocations, diligently and frequently rubbed in, will often abate the pain and swelling of the affected joints.

RHEYDT, a t. of Rhenish Prussia, on the left bank of the Niers, and on the railway between Düsseldorf and Aix-la-Chapelle, 14 m. w. by s. from Düsseldorf. It has manufactures of silks and velvets, soap, glue, vinegar, and leather; it has also dye-works, and some trade in linen. Pop. '75, 15,857.

RHIME. See RHyme.

RHINANTHUS, a genus of plants of the natural order *scrophulariaceæ*, having an inflated 4-toothed calyx; the upper lip of the corolla compressed laterally, furnished on both sides below the tip with a straight tooth or lobe, the lower one plain and 3-lobed. The capsule is compressed and 2-celled. *R. crista-galli* is a very common British plant, an annual, 1 to 2 ft. high, to be seen in almost every meadow and in many pastures, with yellow flowers, and rather large capsules, in which the seeds rattle when ripe, whence its common name, *yellow rattle*. It is also called cock's-comb, from its fringed bracts.

RHIN, BAS (LOWER RHINE), formerly a frontier department of France, and corresponding pretty nearly to the present German administrative district of Lower Alsace (*Nieder-Elsass*) in the imperial territory of Alsace-Lorraine. To the e. lies Baden, and to

the w. are the French departments of Moselle, Meurthe, and Vosges. The area of Bas-Rhin, as a department of France, was 1759 sq.m., and its pop. in 1866 was 609,987; the area of Lower Alsace is 1841 sq.m., and its pop. in 1871, 600,406. This district lies almost wholly within the basin of the Rhine, which flows n. along its eastern border. The eastern portion of the district, lying along the left bank of the Rhine, consists wholly of plains; while in the w. are the rugged and wooded heights which form the eastern slopes of the Vosges mountains. In the hilly regions are many beautiful valleys. The winters are long and cold; the summer variable; the autumns always fine. Cretinism and goiter prevail in some parts, though to a less extent now than formerly. The country is unusually rich in agricultural and manufacturing resources and capabilities. A great variety of grains, fruits, and vegetables, including fine crops of hemp and tobacco, are grown extensively; and wines, red and white, the latter held in the highest estimation, are produced abundantly. Manufactures, textile and other, are carried on on a grand scale. Spinning-mills, weaving factories for cotton, calico, woolen, and other fabrics, are exceedingly numerous, and foundries, arms and machine factories also abound. Some timber, floated down the Rhine in rafts, is exported. The region recently occupied by the French departments of Haut-Rhin and Bas-Rhin constituted, prior to the treaty of Ryswick in 1697, one of the most densely peopled and industrious portions of Germany, called in German, *Elsass* (Lat. *Alsatia*). Ceded then to France, it became the French province of Alsace, which was at the revolution subdivided into the two departments. So it remained till, in 1870, during the war between France and Germany, Bas-Rhin and Haut-Rhin were, with portions of the departments of Moselle, Meurthe, and Vosges, erected by the king of Prussia into the German general government of Alsace. When peace was concluded at Frankfurt, the repossessed German territory was not incorporated with any of the German states; but, certain portions having been restored to France, formed a member of the new German empire, with the title of the imperial territory (*Reichsland*) of Alsace-Lorraine (*Elsass-Lothringen*).

REIN, HAUT (UPPER RHINE), formerly a frontier department in the e. of France, now for the most part comprehended within the German district of Upper Alsace. The area of Haut-Rhin was 1586 sq.m., and its population in 1866 was 530,285; the area of Upper Alsace being 1354 sq.m., and its pop. 71,458,873. The eastern frontier is for the most part formed by the Rhine, and the western frontier by the Vosges mountains. After the Rhine, the principal river is the Ill, into which the streams from the Vosges mountains flow. In the middle of the district the soil is fertile, and of the valleys of the w. some are exceedingly rich and productive. The vineyards are extensive, and much wine is produced. In agriculture, and in trade and manufactures, great activity and enterprise are manifested. At the treaty of Frankfurt, the cantons of Belfort, Delle, Giromagny, with 28 other communes, all formerly included in Haut-Rhin, were restored by Germany. The French remnant was then called "Territory of Belfort," but since 1878 is again Haut-Rhin.

RHINE (*Rhenus*), the most important river in Germany, and one of the most noted in Europe, takes its rise in the Swiss canton of the Grisons, and after a n.n.w. course of about 850 m., falls into the German ocean. The area of the Rhine basin, including its various feeders, which have been counted to the number of 12,000, is estimated at about 86,000 sq. miles. The Rhine is divided into the Upper, Middle, and Lower Rhine, the first of these terms being applied to the river from its source to Basel; the second applies to its course from Basel to Cologne; and the last to its course from Cologne through the Netherlands to the sea, into which it empties itself by several mouths, forming an extensive delta. The head-waters of the Upper Rhine consist of three main streams, called respectively the Vorder Rhine, the Mittler Rhine, and the Hinter Rhine. The first and most easterly rises on mount Crispalt, n.e. of mount St. Gothard, 7,500 ft. above the level of the sea, and flowing e., bursts like a torrent through a deep ravine. At Disentis, 12 m. from its source, it is joined by the Mittler Rhine, or central branch, at the comparative low level of 3,500 feet. At Reichenau, 50 m. from the source of the Vorder Rhine, the stream is swelled by the third branch, known as the Hinter Rhine, which, taking its rise among the glaciers of the Vogelberg, flows over a distance of 80 m. before it blends its waters with the main branches. The Hinter Rhine, considerably the longest of the upper waters, claims to be esteemed the chief source, and at its confluence with the other branch at Reichenau, the river first assumes the general name of Rhine. At Coire, where the river takes a sudden turn northward, it is nearly 150 ft. wide, and navigable for rafts and flat boats. A little above the small town of Sargans, in St. Gall, it leaves the Grisons, and forming the boundary between the small principality of Lichtenstein and the Vorarlberg on the right, and St. Gall on the left, flows in a northerly direction to Rheineck, where it enters the Boden See, or lake of Constance, which may indeed be regarded as the river itself, augmented in its course between Rheineck and Constance by the confluence of numerous streams. Emerging from the upper lake at Constance, the Rhine enters the Unter See, or lower lake, a few m. below, and following a westerly course, forms the boundary-line between Switzerland and the grand duchy of Baden; and after receiving the Thur, Töss, and Aar on the left, and the mountain torrents of the Wutach and Alb on the right, pursues its course to Basel. At Schaffhausen, about 13 m. from the western extremity of the Unter See, the waters of

the river, rushing over a rock 70 ft. high, form the cataract known as the falls of Schaffhausen; while lower down the narrowing of the channel through the projection of rocks on either side gives rise to rapids both at Laufenburg, and at a point 10 m. below it, known as Höllebacken, where the navigation is impeded for a considerable distance by the force of the cataracts. Below Basel, the Rhine, turning again due n., separates Alsace-Lorraine from Baden, forms the eastern boundary of Rhenish Bavaria, cuts the province of Rhine-Hesse in two, and flows between Hessen-Nassau and Rhenish Prussia, through which it afterward pursues a n.w. course. Before it reaches Cologne, it takes up numerous tributaries and affluents, viz.: the Ill, Wiese, Elz, Kinzig, Murg, Neckar, Main, Lahn, Moselle, etc.; and passes the cities of Erisach, Strasburg, Gernersheim, Spires, Mannheim, Worms, Oppenheim, Mainz, Bingen, Coblenz, and Bonn. In this middle part of its course, the river makes great bends, the current is rapid, and navigation is rendered difficult by numerous small islands and sand-banks, which are subject to changes of form and position. Much has been done to improve the Rhine above Bingen. By an agreement made in 1840, between France and Baden, it has been brought into its proper channel and considerably shortened. The valley through which the Rhine runs between steep banks from Mainz to Bonn, contains the picturesque scenery which has made this river so celebrated, and the vineyards from which the famous Rhenish wines are obtained. From Cologne to its mouth, the Rhine flows through a low level country, and soon after entering the Netherlands, divides it into two arms, the left, called the Waal, uniting with the Maas near Fort Loevestein, and forming the Merwede or Merwe, which below Dordrecht takes the name of the Old Maas; the right arm, called the Rhine, a little above Arnheim, throws off the New Yssel, originally a canal, cut by Drusus to connect the Rhine with the Old Yssel. Flowing on to Wijk bij Duurstede, the Rhine divides again into the Lek, which unites with the New Maas near Ysselmonde, and the Kromme Rhine, which at Utrecht parts into the Vecht and the Old Rhine, the latter as a small stream entering the North sea by the Katwijk canal to the n.w. of Leyden. The delta of the Rhine, which extends from about 51° 25' to 52° 20' n. lat., and occupies nearly 50,000 sq.m. of territory, belonging to the Dutch provinces of North and South Holland, Utrecht, and Guelderland, requires to be protected by strong embankments. The principal of these, which begin at Wesel, are about 25 or 30 ft. above the lowest level of the river. Several canals connect the Rhine with the Rhone and Saone, the Scheldt, Meuse, and Danube, and thus open a line of communication with France and Belgium on the one side, and with the Netherlands and every part of Germany on the other. The commerce and navigation of the Rhine, which are of vast extent and great importance, used to be regulated by treaties between the different states through which it passes, all of which levied tolls on vessels and goods entering their respective territories, and thus produced an accumulation of duties which pressed heavily on the transit trade. Steam-navigation is, however, conducted with greater regularity and energy on the Rhine than on any other river of Germany; and of late years, since the main lines of railway, running on either side of the river, have been connected by railway bridges across the river, additional importance and extension have been given to the commercial relations of all the countries connected with the Rhine. Pontoon or boat bridges cross the river at Cologne, Mainz, Mannheim, and a few other places.

RHINE, CONFEDERATION OF THE. See CONFEDERATION OF THE RHINE.

RHINE-WINE is a term of very general signification, applied, however, most frequently to those wines produced in the Rheingau (q.v.). The most valued and costly of these are the Schloss-Johannisberger, Hochheimer, Kloster-Erbacher, Rudesheimer, Steinberger, Gräfenberger, Raenthaler, Rothenberger, Scharlachberger, and Markobrunner. The red Rhine-wines, of which the Asmannsläuser is the most celebrated, are not nearly so much prized as the white; neither have they the strength or bouquet of the latter. The wines of the lower Rhine, from Düsseldorf downward, are generally of inferior quality.

The term Rhine-wine, in its general signification, includes the Pfalz and Moselle wines. It is now generally held in Germany that Rhine-wines that have been properly kept for 3 or 4 years are in the most wholesome condition for use; the very old stocks no longer find a ready market except in Russia and England.

RHINOCEROS (Gr. nose-horned), a genus of *pachydermata ordinaria*, containing the largest and most powerful of terrestrial mammalia, except the elephants. There are at least 7 or 8 existing species, all natives of the warm parts of Asia, the Indian archipelago, and Africa; and numerous fossil species have been discovered in the newest geological deposits. The form of the rhinoceros is clumsy and uncouth; its aspect dull and heavy. The limbs are thick and strong; each foot is terminated by three toes, which are covered with broad hoof-like nails. The tail is small, and terminated by a small tuft. The ears are moderately large; the eyes very small. The head is large, the muzzle prolonged, and the nasal bones combined into an arch for the support of a horn, which, however, does not spring from them, but merely from the skin; a second horn, in some of the species, growing above it, in like manner springing from the skin, and resting for support on the bone of the forehead. The upper lip is more or less prolonged and prehensile, in some of the species so much so that it is capable of being used to pick

up very small objects. The whole body, head, and limbs are covered with an extremely thick and hard skin, which in none of the existing species exhibits more than mere traces of hair, although there is evidence that some of the extinct ones were covered with fur; and the hardness of the skin being such that in some of the species it has not pliancy enough to permit the movements of the animal, it is in a manner jointed by means of folds on the neck, behind the shoulders, in front of the thighs, and on the limbs.

The horn of the rhinoceros is a very remarkable organ, and a powerful weapon of offense and defense. With it also the animal can root up bushes or small trees, the foliage or fruit of which it desires to eat. It is of a perfectly homogeneous structure (see HORNS), and solid.

The different species of rhinoceros display some differences of dentition. None of the species displays a high degree of intelligence. Although usually harmless, they are easily provoked, and show much capriciousness of temper. When irritated they become very dangerous; and although usually slow in their movements, they can, upon occasion, run rapidly. Their great weight and strength enable them to force their way through jungles, breaking down the smaller trees before them. The hide is proof against the claws of the lion or tiger, and is not to be penetrated by a leaden bullet, except at a very short distance, or in some of the thinner parts about the neck and chest. Bullets of iron or tin are used for shooting them.

The species of rhinoceros agree in being found sometimes solitary or in pairs, sometimes in little companies, never in large herds.

The INDIAN RHINOCEROS (*R. Indicus*) is a native of the continental parts of the East Indies, and lives chiefly in marshy jungles on the banks of lakes and rivers, often wallowing in the mud, with which it encases itself, apparently as a protection against insects, which annoy it notwithstanding the thickness of its hide. It is the largest known species of rhinoceros, a large specimen being rather more than 5 ft. in height. The horn is sometimes 3 ft. in length, and 18 in. in circumference at the base. The Indian rhinoceros was known by very imperfect description to the ancient Greeks, receiving the very inappropriate name of *Indian ass*; and from accounts of it the fable of the unicorn probably originated. Individuals have from time to time been brought alive to Europe, and have proved tolerably quiet and tractable, feeding with apparent satisfaction on moistened hay, vegetables, pulse, grain, etc.—The JAVANESE RHINOCEROS (*R. Javanicus*, or *R. Sondaicus*) is a somewhat smaller species, also one-horned. Sumatra has a two-horned species (*R. Sumatrensis*).—Different species of rhinoceros, all two-horned, are found in almost all parts of Africa, and one or more of them were known to the ancient Romans.—The BOVELE, or BLACK RHINOCEROS (*R. bicornis* or *R. Africanus*), of south Africa, is the smallest of all the known species. It is of a black color, and its first horn is rather thick than long, its second short and conical. It is a fierce and dangerous animal, capable of great activity, and more dreaded by the south African hunter than the lion itself.—The KETTLOA (*R. keilou*) is larger, and has the two horns nearly equal in length, the foremost horn curved backward the other curved forward. It is also a native of south Africa, and much dreaded both on account of its strength and its ferocity.—The WHITE RHINOCEROS (*R. sinus*), or MUCUTCO, or MONOOHO, is the largest of the well ascertained African species.

No species of rhinoceros is prolific. One young one only is produced at a birth, and the intervals are long. The flesh of the rhinoceros is used for food. That of the different species is somewhat variously esteemed. The skin is used in the East Indies for shields; in south Africa it is sliced up into thongs.

The earliest remains of the rhinoceros are found in miocene strata, and in the subsequent tertiary deposits they frequently occur. Ten species have been described. A two-horned species was found by Pallas in the frozen gravel of Siberia, along with the mammoth, still covered with a shaggy coat of long wool, and having its flesh preserved.

RHINOPLASTIC OPERATION. When a portion or the whole of the nose has been destroyed by accident or disease, the deficiency may be restored by a transplantation of skin from an adjoining healthy part. When the whole nose has to be replaced, the following course is usually adopted. A triangular piece of leather is cut into the shape of the nose, and is extended on the forehead with its base uppermost; its boundaries, when thus flattened, are marked out on the skin with ink. Any remains of the old nose are then pared away, and a deep groove is cut round the margins of the nasal apertures. When the bleeding from these incisions has stopped, the marked portion of the skin of the forehead must be carefully dissected away, till it hangs by a narrow strip between the eyebrows. When the bleeding from the forehead ceases, the flap must be twisted on itself so that the surface which was originally external may remain external in the new position, and its edges must be fastened with stitches into the grooves prepared for their reception. The nose thus made is supported with oiled lint, and well wrapped in flannel, to keep up the temperature. When complete adhesion has taken place, the twisted strip of skin may be cut through, or a little slip may be cut out of it, so that the surface may be uniformly smooth. When only a part of the nose, as one side only, or the septum, requires to be restored, modifications of the above operation are required, and the skin, instead of being taken from the forehead, is taken from the cheek or the upper lip. For further details regarding this important operation, the reader is referred to Vergusson's *Practical Surgery*.

This operation is popularly known as the *Taliacotian Operation*, from its having been first performed by Taliacotus, who was professor of anatomy and surgery at Bologna, where he died in 1553. The work in which the operation is described was not published for more than 40 years after his death. It appeared in 1597, under the title *De Curtorum Chirurgia per Insitionem libri duo*. Instead of taking the skin for the new nose from the forehead, he took it from the arm of his patient, and there is no reason why the operation which he describes, although inferior in many respects to that at present adopted, should not be successful. The difficulty of keeping the arm sufficiently long in apposition with the face (a period of about 20 days), was doubtless one of the reasons for selecting the forehead in preference as the part from which to take the skin. The name of Taliacotus has been mainly popularized in this country by a well-known coarse joke in Butler's *Hudibras*. There is, however, little foundation for the view which Butler takes of the operation. Taliacotus discusses the advantages and disadvantages of taking the skin from the arm (he does not suggest any other part of the body) of another person, but he comes to the conclusion that it would be impossible to keep two persons so fastened together for the necessary time, that no motion of the parts in apposition should occur, and he adds that he never heard of the plan being attempted. It is almost unnecessary to add that even if a nose were manufactured from the skin of a second person, there is not the slightest reason for apprehending that it would suddenly die and drop off on the death of the original proprietor of the skin, notwithstanding the cases to the contrary recorded, as illustrative of the power of sympathy, by Van Helmont, Campanella, sir Kenelm Digby, and others. This astounding notion was resuscitated not many years ago by M. Edmund About in a popular novel, entitled *Le Nez d'un Notaire*.

RHIPIPTERA. See STREPSIPTERA.

RHIZANTHÆÆ (RHIZOGENS of Lindley) are a very remarkable natural order of plants. They are parasitical plants, brown, yellow, or purple, never of a green color, destitute of true leaves, and having cellular scales instead. The stem is amorphous and fungus-like: sometimes, as in *Rafflesia* (q. v.) there is no stem: but the flowers arise immediately from the surface of the branch or stem to which the plant is parasitically attached. Spiral vessels are either few or wanting, and the substance is chiefly cellular tissue. While their general structure thus associates them with fungi, which they resemble also in their mode of decay, they have the flowers and sexual organs of phanerogamous plants. The flowers are monœcious, diœcious, or hermaphrodite. Lindley regards these plants as forming a class distinct from the other phanerogamous plants (*exogens* and *endogens*), and as one of the connecting links between them and the cryptogamous plants (*thallogens* and *acrogens*). There are not many more than 50 known species in all, of which one or two are found in the s. of Europe, the others in Africa and the warmer parts of Asia and America. *Cynomorium coccineum* (*balanophoraceæ*) is found in Malta, and is the fungus *miltenisii* of apothecaries, long celebrated for arresting hemorrhages. Others are likewise used as styptics. *Cytinus hypocistis* (*cytinaceæ*) grows on the roots of species of cistus in the s. of Europe. Its extract (*succus hypocistidis*) is used as an astringent in hemorrhages and dysentery. A species of *ombrophytum* (*balanophoraceæ*) springs up suddenly after rain in Peru, like a fungus, is insipid, and is cooked and eaten under the name of *mays del monte*. Different species of *balanophoru* are very abundant in northern India. They are found in the Himalaya at an elevation of 10,000 ft. producing great knots on the roots of maple trees, oaks, etc., which are sought after by the Thibetans, and carried into Thibet, where they are made into very beautiful cups.

RHIZOPODA (Gr. *rhizon*, a root, and *poda*, feet), an important class of the lowest of the animal subkingdoms, the protozoa. In all the organisms of this class, the body is composed of a simple gelatinous substance, to which the term "sarcode" is applied; and tion, all, locomotion is performed by the protrusion of processes which, from their function are termed "pseudopodia," or false feet. As in the case of all the protozoa, except the infusoria, there is no mouth or intestinal tube.

As a typical form of rhizopod, the *ameba* a minute animal readily obtained in this country, may be taken. On placing one of these organisms (obtained from a pond, or from a bottle containing some vegetable infusion) under the microscope, it is seen to resemble a roundish mass of semi-transparent jelly, altogether devoid of life. Soon, however, the animal begins to push out in various directions portions of the gelatinous mass of which it consists, and by the alternate expansion and retraction of these prolongations it effects a slow and somewhat irregular locomotion. Should these processes come in contact with anything fit for food, they grasp it and coalesce around it, and the morsel soon becomes inclosed in the interior of the body, much as (to use an illustration employed by prof. Greene in his *Manual of the Protozoa*) a stone may be forced into the interior of a lump of clay, or similar plastic material. When all that is nourishing is absorbed, the indigestible remains are ejected through some part of the body. A nucleus may generally be observed, and at times (but not permanently) one or more clear vesicles may be noticed, containing a fluid which is apparently furnished during the process of digestion. The members of the genus *ameba* (containing at least three species) may be regarded as representing the simplest forms of animal life. Closely allied to the *ameba* is the *actinophrys*, or sun-animalcule, and both these genera are completely naked. In *diffugia* the "sarcode" is invested with a membranous oval coat with an aperture at one

end, from which the pseudopodia project. In *ascella* the soft parts are protected by a discoid or hemispherical shield, open below; while in the *foraminifera* (q.v.), the soft part is invested with a calcareous shell, which is sometimes simple, but more commonly consists of an agglomeration of minute chambers.

Various classifications of the rhizopods have been proposed by different zoologists. That of Greene, in which they are simply divided into *amabea* and *foraminifera*, is sufficient for all practical purposes. All the *amabea* are microscopic, and seldom exceed $\frac{1}{16}$ of an inch in diameter. The *foraminifera* (q.v.) are somewhat larger.

Among the most important contributions to our knowledge of this department of the animal kingdom must be mentioned: Schultze, *Ueber den Organismus der Polythalamien*, 1854; Williamson, *On the Recent Foraminifera of Great Britain*, 1858; Claparede et Lachmann, *Etudes sur les Infusoires et les Rhizopodes*, 1858-60; Carpenter, *Introduction to the Study of the Foraminifera*, 1861; and Haeckel, *Die Radiolarien*, 1862.

RHODE ISLAND, one of the 13 original United States of America, and the smallest in the union, on the southern coast of New England, is $47\frac{1}{2}$ m. from n. to s., and 37 m. from e. to w.; and has an area of 1306 sq. miles. It is bounded n. and e. by Massachusetts, s. by the Atlantic, and w. by Connecticut. It is divided into five counties, and its principal towns are Providence and Newport, the twin capitals; Bristol, Warren, Pawtucket, Woonsocket, etc. Narragansett bay, which occupies the south-eastern quarter of the state, is from 3 to 12 m. wide, and filled with beautiful islands, the largest of which, Rhode Island, is 15 m. long, by 3 to $3\frac{1}{2}$ m. wide, and contains the town of Newport, a fashionable summer resort, with a large and spacious harbor, and formidable fortifications. Several small rivers, as the Pawtucket, Pawtuxet, Paroquet, etc., rising in the hills of Massachusetts, flow into Narragansett bay, and their frequent falls afford water-power to numerous manufacturing villages. The country is hilly, and the soil rough and stony, and chiefly devoted to pasturage and orchards. The formation is chiefly of primary stratified and unstratified rocks, with some coal of a poor quality, iron, limestone, and marble. The climate is mild, and on the islands delightful. The population is chiefly engaged in trade and manufactures. There are in the state 142 cotton, 65 woolen, 26 iron factories; and a large coasting-trade and considerable fisheries are carried on. There are several railways. The state debt in 1878 was 2,434,500 dollars; the receipts for the year 1877-78 were 832,980 dollars. There are 62 national banks and 37 savings-banks, 6 daily and 19 weekly newspapers, about 300 churches, over 700 schools with 40,000 pupils, Brown university, and state penitentiary and asylums (see PROVIDENCE). The government, which existed until 1843 under the charter given to Roger Williams in 1642, is similar to that of the other states. The governor has a salary of 1000 dollars, or about £200, and the lieutenant governor 500 dollars, or £100 per annum. Rhode Island is believed to have been the Vinland of the Norsemen, who explored this coast in the 10th century. It was settled in 1636 by Roger Williams and his companions, Baptists, who expelled for their religious opinions from the Puritan colony of Plymouth. The colony suffered from the Indian wars, until the defeat and death of Philip, king of the Wampanoags. Pop. in 1820, 83,659; 1840, 108,830; 1860, 174,621; 1870, 217,353, of whom 4,980 were colored; 1875, 258,239.

RHODE ISLAND (*ante*). After establishing a settlement at Providence (so-called in grateful acknowledgment of "God's merciful providence to him in his distress"), Roger Williams went to England in 1643 and obtained a patent that remained in force until 1663, when a charter was obtained from Charles II. incorporating the colony of "Rhode Island and Providence Plantations," which was the only constitution of government for 180 years. The colony was engaged in the great Indian war of 1675; then in the uprising against sir Edmund Andros; after which, during the following ninety years, it enjoyed prosperity and grew into prominence for its commerce and naval importance. In the war of the revolution the citizens of the colony were prominent both on sea and land, though it was the last of the thirteen colonies that accepted the constitution of the United States, its assent having been given on May 29, 1790. The soil of the state, though moderately fertile, is better adapted to grazing than to the cultivation of cereals, and the state has never had much importance in respect to its agricultural products. Nevertheless, in 1870, of the state's 675,000 acres of area, 502,308 acres were farms, and 289,030 acres were under cultivation. The productions were 784 bushels of wheat, 20,214 of rye, 311,957 of Indian corn, 157,010 of oats, 33,559 of barley, 1,444 of buckwheat, 9,920 of peas and beans, 669,408 of potatoes, 1,938 of grass seed, 796 lbs. of tobacco, 77,328 of wool, 941,199 of butter, 81,976 of cheese, 6,290 of honey, 765 gallons of wine, 1,944,044 of milk sold, and 89,045 tons of hay. The live stock on farms included, 7,770 horses, 18,806 milch cows, 5,821 working oxen, 9,748 other cattle, 23,938 sheep, and 14,607 swine. The crops of cereals are never large enough for the home consumption. But in the amount of manufactured products the state ranks tenth in the union. In 1870 nearly one-fourth of the entire population was employed in manufactories, and the annual product of the mills was about \$530 to each inhabitant. There were 1850 establishments, employing 28,804 men, 14,752 women, and 5,861 children. The capital invested was estimated at \$66,557,322; raw material used, \$73,154,109; and the annual product, \$111,418,354. Providence has extensive manufactures of machinery, steam-engines, screws, nails, jewelry, silver and plated wares, cigars, furniture, wire-

goods, cotton and woolen goods, stoves, small wares, and chemicals, and is the leading market for print-cloths in the United States. Pawtucket has equally varied industries, and the whole region is thickly settled with manufacturing villages. The commerce of the state is chiefly domestic. Providence receives large quantities of coal and cotton for the neighboring states, as well as for the home supply, and ships manufactured goods. Much merchandise is also landed and shipped at this point for the Boston trade. The customs districts are Providence, Newport, and Bristol and Warren. For the year 1875 the imports amounted to \$314,700 and the exports to \$39,820.

Among the important railroads passing through the state are the Boston and Providence, New York, Providence and Boston, Old Colony, Providence and Worcester, and Providence and Springfield. In 1876 the total number of miles of track within the state was 220. The national banks in the state in 1875 numbered 62, with an aggregate capital of \$20,504,800 paid in; state banks in operation, 15, with capital amounting to \$5,091,697; and savings-banks, 38, with \$51,311,330 on deposit. Of the insurance companies, there were at the beginning of 1876, 6 joint-stock and 18 mutual fire-insurance companies. The first had a paid-up cash capital of \$1,300,000; the others had cash assets to the amount of \$1,226,207.

The assessed valuation of real estate in the state in 1870 was \$132,876,581; of personal property, \$111,402,273. The total taxation not national during the same year was \$2,170,152, of which \$489,253 was state and \$1,680,899 town, city, etc. In 1879 the receipts of the treasury were \$970,072, and the disbursements \$703,211. The bonded debt of the state amounted to \$2,534,500, or, with the deduction of an available sinking fund, to \$1,832,462. The total amount of the sinking fund was \$733,764, which was invested principally in securities of the city of Providence and of the United States government.

The public schools are supported by state, town, district, and other taxes; and are under the supervision of a board of education, a commissioner of public instruction, and city and town superintendents. In 1879, out of 49,562 children between the ages of five and fifteen, 32,793 were reported attending public schools; 4,374 attending Roman Catholic schools; and 1,782 attending private schools. Altogether there were 819 schools and 888 teachers. The number of school-houses was 446, and the estimated value of school property \$2,654,148. The appropriation from the state amounted to \$92,923; from the towns, \$340,237; and from other sources about \$84,000, making a total revenue of over \$500,000. The higher institutions are a state normal school in Providence, which gives free tuition to all who intend to teach, and Brown university (q.v.). The newspapers and periodicals published include 6 daily papers, 19 weeklies, and 6 monthlies. The leading church organizations in 1870 were as follows: Baptist, 109; Congregational, 27; Episcopal, 42; Friends, 17; Methodist, 23; Roman Catholic, 22; Second Advent, 17; Unitarian, 4; and Universalist, 4.

The constitution of Rhode Island provides that voters, in addition to the ordinary qualification of residence and the usual exceptions of disqualification, must either have real estate of the value of \$134 or property renting for not less than \$7 a year, or must pay a tax of at least \$1.00, or have done military duty during the year. The legislature consists of a senate of 36 members (1 from each town) and a house of representatives not exceeding 72 members. Two sessions are held annually, the principal one at Newport, and an adjourned one at Providence in October. The state elections are held annually. Under the apportionment of 1872 the state is entitled to two members of Congress and has 4 electoral votes. The electoral votes have been cast as follows: 1792, Washington and Adams, 4; 1796, Adams and Ellsworth, 4; 1800, Adams for president, 4, while the vote for vice-president was broken; 1804, Jefferson and Clinton, 4; 1808, Pinckney and King, 4; 1812, De Witt Clinton and Ingersoll, 4; 1816, Monroe and Tompkins, 4; 1820, Monroe and Tompkins, 4; 1824, John Quincy Adams and Calhoun, 4; 1828, John Quincy Adams and Rush, 4; 1832, Clay and Sergeant, 4; 1836, Van Buren and Johnson, 4; 1840, Harrison and Tyler, 4; 1844, Clay and Frelinghuysen, 4; 1848, Taylor and Fillmore, 4; 1852, Pierce and King, 4; 1856, Fremont and Dayton, 4; 1860, Lincoln and Hamlin, 4; 1864, Lincoln and Johnson; 1868, Grant and Colfax, 4; 1872, Grant and Wilson; 1876, Hayes and Wheeler, 4; 1880, Garfield and Arthur, 4.

RHODES, an island now belonging to Asiatic Turkey, and long an important, wealthy, and independent state of ancient Greece, in the Mediterranean, lies off the s.w. coast of Anatolia, from the nearest point of which it is distant about 12 miles. It is 45 m. long, and 20 m. in greatest breadth, and is traversed in the direction of its length—from n.e. to s.w.—by a chain of mountains, which reach in mount Artemia (the former *Atabyros*) a height of 4,070 ft., and in mount Artamiti of near 6,000 feet. Pop. about 30,000, of whom 6,000 are Turks, 1000 are Jews, and the remainder Greeks. The mountains are covered with forests, the valleys are fertile, and the well-watered plains form rich and beautiful pasture-lands. Of all the islands in the Levant, Rhodes possesses the most beautiful and the most temperate climate. It produces oil, oranges, citrons, etc., and might raise in profusion most necessaries and luxuries. But owing to the insecurity and extortion from which the Rhodians have long suffered, agriculture is in a very depressed state; much fertile land lies waste, and the island does not even raise corn enough for its scanty population. A little marble is quarried. The harbors are neglected, and the trade is now inconsiderable.

Rhodes, the ancient *Rhodos*, was inhabited at a very early period. The Telchines, who are asserted by tradition to have been its most ancient inhabitants, are said to have migrated hither from Crete. It was not, however, until the immigration of a branch of the Doric race that the distinctive national character of the Rhodians became fixed. The first immigration of Dorians seems to have taken place before the Trojan war, for Rhodes is said to have sent nine ships to Troy under the leadership of the Heracleid Tlepolemus. Situated between the three ancient continents, a position highly favorable to the development of commercial enterprise, the Rhodians at an early period rose to great prosperity and affluence. Their three most ancient towns were Lindus, Ialysus, and Camirus, and they planted numerous colonies not only on the shores in their vicinity, but also on the coast of Lycia, Italy, Sicily, and Spain. At the end of the 5th c. B. C. they founded the city of Rhodes (q.v.); and, after this event, the history of the island is comprised in that of the city.

RHODES, an ancient and famous maritime city, capital of the island of the same name, and situated on the n.e. extremity of that island. Lat. of harbor 36° 26' n., long., 28° 16' east. The modern city, though scarcely one-fourth the size of the former one, has an imposing appearance. Its site is admirable, and it rises in the form of an amphitheater behind the fortified harbors, of which there are two, separated from each other by a narrow quay. At the entrance to the harbors stand the two large quadrangular towers of St. John and St. Michael. The harbors, however, are now neglected, and this once flourishing mart of the east is now comparatively desolate, and is no longer the seat of industry or active commerce. The town, overlooked by mosques and minarets, consists of ill-built houses and gloomy streets. The earthquakes of 1851, of 1856, and of 1863, as well as the frightful powder-explosion in 1856, caused by a flash of lightning, did much to devastate the town. By the powder-explosion, the church of St. John, built in 1500, and the great tower of the knights of St. John, were shattered, together with 300 houses, under the ruins of which 1000 townspeople lost their lives; and by the earthquake of 1863, 2,000 houses were destroyed, and many lives lost. The palace of the grand master is now in ruins, and the hospital of the knights now serves as a granary. Pop. about 20,000.

The city of Rhodes was founded in 408 B. C., and was built on a regular plan, the unity and harmony of its architecture being secured by the circumstance that the design of the whole was the work of one man. It was girt about by strong walls, surmounted by towers, and was provided with two excellent harbors. But it was remarkable for the number and excellence of its paintings, sculptures, and statues, as well as for the beauty and strength of its architecture. At the entrance of one of its ports stood a gigantic brazen statue of Helios, 70 cubits in height, and called the Colossus of Rhodes. Besides this statue, which is described as one of the seven wonders of the ancient world, 3,000 others, of which 100 were colossal, adorned the city. The capital of a fertile and flourishing island, and the great center of the commerce of the Mediterranean, Rhodes long enjoyed great prosperity. The arts were also prosecuted with assiduity, and intellectual activity manifested itself here long after it had declined in most parts of Greece. From the outbreak of the Peloponnesian war to the middle of the 4th c. B. C., Rhodes was alternately in league with Athens and in arms against that city. Like the rest of Greece, it submitted to the victorious Alexander, and received a Macedonian garrison; but on the death of Alexander, 323 B. C., the Rhodians rose upon and expelled the intruders. From this time to the overthrow of the Macedonian monarchy, Rhodes largely extended its territories, and rose to great commercial and naval importance. After the death of Cæsar, whose side the Rhodians had taken against Pompey in the civil war, they were defeated in a naval engagement by Cassius, who in 42 B. C. entered the city by force, massacred the hostile leaders, seized the public property, and rifled the temples. This visitation broke the power of Rhodes, but it long continued to maintain its *prestige* as a seat of learning. During several centuries Rhodes remained in the power of the Greek emperors. In 1310 the grand master of the knights of St. John of Jerusalem settled here, and here the brethren remained till the 16th century. (See JOHN, ST., KNIGHTS OF). Since this period, Rhodes has remained a possession of Turkey.

RHODIAN LAW is the earliest system of marine law known to history, said to be compiled by the Rhodians after they had by their commerce and naval victories obtained the sovereignty of the sea, about 900 years before the Christian era. Cicero refers to the Rhodians as illustrious for their naval discipline. The collection of marine institutions termed Rhodian laws is to be found in Vinnius, but their authenticity is doubted. Some say that the Romans adopted these laws during the first Punic war; others say that Justinian incorporated them with the Roman law. The leading points supposed to be borrowed from the Rhodian law relate to the shares of the officers and crew of a ship, the punishment of barratry and of plundering wrecks, and compensation payable to the heirs of mariners who lost their lives in the service of the vessel.

RHODIUM (symb. R., Rh, and, Ro, according to different chemists; eq. 52—new system, 104—sp. gr. 12.1) is one of the metals of the platinum group. It is a white, very hard metal, resembling aluminium rather than silver. It fuses less easily than platinum. It is ductile and malleable when pure and after fusion, and insoluble in all acids; but when alloyed in small quantity with platinum, copper, bismuth, or lead,

It dissolves with them in *aqua regia*. It usually forms about one-half per cent of the ore of platinum, from which it is extracted by a complicated process, for details of which we must refer to Deville and Debray's "Mémorial on Platinum and its Ores," in the *Annales de Chimie et de Physique* for 1859. Two oxides, two sulphides, and three chlorides of rhodium have been obtained and examined by chemists. The sesquichloride unites with several soluble chlorides to form crystallizable double salts, which are of a rose color (whence the name rhodium, from the Gr. *rhodon*, a rose). An alloy of steel, with a small quantity of rhodium, is said to possess extremely valuable properties; and according to Deville, an alloy of 30 or more parts of rhodium with 70 of platinum, is easily worked, and is not attacked by *aqua regia*, and hence it forms an excellent material for crucibles. This metal was discovered in 1803 by Wollaston.

RHODORA, a shrub of the United States, the *rhodora canadensis*, placed by some botanists with the rhododendron, from which it differs in its deciduous leaves, and in the shape of the flower, the corolla being two-lipped. The shrub is from 1 to 3 ft. high, leaves oblong, revolute on the margin, pale, smooth, green above, lighter and downy beneath. The flowers are in terminal umbels, and commence to blossom before the budding of the leaves, in April. They are very showy, of a bright rose-purple color. There is a white-flowered variety. Rhodora grows in cool mountain woods, in moist, springy places, but thrives well in gardens.

RHODODENDRON (Gr. rose-tree), a genus of trees and shrubs of the natural order *Ericaceæ*, having 10 stamens, a very small calyx, a bell-shaped or somewhat funnel-shaped corolla, and a capsule splitting up through the dissepiments. The buds in this and nearly allied genera, as *azalea* (q.v.), are scaly and conical. The species are numerous; they have evergreen leaves, and many of them are of great beauty both in foliage and in flowers. A few small species are natives of continental Europe and of Siberia; but the greater number belong to the temperate parts of North America, and to the mountains of India. *R. maximum*, so designated when the far larger Indian species were unknown, is common in Britain as an ornamental shrub. It is a large shrub or small tree, which forms impenetrable thickets on many parts of the Alleghany mountains, and has a magnificent appearance when in flower. The leaves are large, oblong, acute, stalked, leathery, dark-green and shining above, rusty brown beneath. The flowers are large, in umbellate corymbs, varying in color from pale carmine to lilac. This species is quite hardy in Britain; as is also *R. ponticum*, a very similar species, with narrower and more pointed leaves, which are of the same color on both sides, a native of western Asia, and apparently also of the s. of Spain. *R. cataebense*, a native of the southern parts of the Alleghany, with large purple flowers; *R. Carucisicum*, the name of which indicates its origin; and *R. aboreum*, a native of Nepal, with very dense heads of large scarlet flowers, and leaves 4 to 6 in. long, attaining in its native country a height of 30 or 40 ft., are also fine species, and well known. Most of the extremely numerous varieties now common in our gardens and shrubberies have been produced from them by hybridizing or otherwise.—Many splendid species of rhododendron have recently been discovered in the Himalaya, the Khasia hills, and other mountainous parts of India, by Dr. Hooker and others; and some of them have begun to be introduced into cultivation in Europe. It is impossible for us to notice more than a few. *R. Falconeri* is described as in foliage the most superb of all, the leaves being 18 or 19 in. long. It is a tree 30 to 50 ft. high, with leaves only at the extremities of the branches. It grows in eastern Nepal at an altitude of 10,000 feet. *R. argenteum* has flowers $4\frac{1}{2}$ in. long, and equally broad, clustered, and very beautiful. *R. Maddenii*, *R. Aucklandii*, *R. Engeworthii*, and others, have white flowers. *R. Dalhousie* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from 3 to 6 white lemon-scented bells, $4\frac{1}{2}$ in. long, at the end of each branch. *R. Nuttallii* has fragrant white flowers, said to be larger than those of any other rhododendron. All these belong to the Himalaya. In more southern latitudes, as on the Neilgherry hills and on the mountains of Ceylon, *R. nobile* prevails, a timber tree 50 to 70 ft. high, every branch covered with a blaze of crimson flowers.—*R. Keysii* and *R. Thibaudiense*, also natives of the n. of India, have flowers with nearly tubular corolla.—*R. ferrugineum* and *R. hirsutum* are small species, shrubs from 1 to 3 ft. in height, natives of the Alps, and among the finest ornaments of alpine scenery. They are called *alpenrose* (alpine rose) by the Germans. They are not easily cultivated in gardens. They have small carmine-colored flowers in umbellate clusters. The mountain slopes glow with their blossoms in July and August. The flora of the Himalaya contains a number of similar small species. *R. anthopogon* and *R. setosum*, dwarf shrubs with strongly-scented leaves, clothe the mountains in eastern Nepal at an elevation of 12,000 ft. and upward, with a green mantle, brilliant with flowers in summer. *R. niveale* is the most alpine of woody plants, spreading its small woody branches close to the ground, at an elevation of 17,000 ft. in Sikkim. *R. lapponicum*, a pro-cumbent shrub, with small flowers, grows as far n. as human settlements have reached in Europe, Asia, and America.—Some of the species of this genus possess narcotic properties. An oil obtained from the buds of *R. ferrugineum* and *R. hirsutum* is used by the inhabitants of the Alps, under the name *olio di marmotta*, as a remedy for pains in the joints, gout, and stone. *R. chrysanthemum*, a low shrub, with golden yellow flowers, native of Siberia, is also used in gout and rheumatism. *R. cinnabarinum*, a Himalayan

species, poisons goats which feed upon it, and when used for fuel causes inflammation of the face and eyes. But the flowers of *R. arboreum* are eaten in India, and Europeans make a pleasant jelly of them.

RHOMBUS. See PARALLELOGRAM.

RHONE (*Rhodanus* of the Romans), which takes its rise in the Swiss Alps, on the western side of mount St. Gothard, not far from the sources of the Rhine, is the only important French river which falls into the Mediterranean. Its entire length, from its origin to the gulf of Lyons at its embouchures, is 614 m. and the area of its river basin 28,000 sq. miles. The Rhone is, for its length, probably the most rapid river in the world. On issuing from its source it runs in a south-westerly direction through the canton of Valais, and after being swelled in its rapid course by the afflux of several tributaries, it takes a sudden turn to the n. near Martigny, and throws its waters into the lake of Geneva (q. v.). After issuing from the lake it takes up the turbid stream of the Arve, and, forcing its passage through a rocky gorge of the Jura chain, disappears below the rocks near fort l'Écluse for a length of 300 ft., forming the subterranean channel known as *La Perte du Rhone*. At St. Génis the Rhone enters a less mountainous district, and passing beyond the Jura district, flows through a low valley to Lyons, where it receives the Saône. From Lyons it follows a southern direction past Vienné, Valence, Montélimart, Avignon, and Arles, bifurcating near Beaucaire and Tarascon into two main streams, the Greater and the Lesser Rhone, which inclose the delta known as the Ile de la Camargue, and finally merge their waters with those of the Mediterranean. The most important affluents of the Rhone are, on the right, the Ain, Saône, Doubs, Ardèche, and Gard; on the left, the Arve, Isère, Drôme, and Durance. From Lyons southward the Rhone is easily navigable for good-sized vessels; but the up-navigation, owing to the rapid fall of the stream, and the sudden shifting of sand-banks, is attended with considerable difficulty, and is at times almost impracticable. On account of these and other obstructions, which are greatest near the mouths of the river, the communication with the Mediterranean is chiefly effected by means of canals, which, communicating with several shore-lakes, as l'Étang de Berre and others, open a passage between the sea at Port du Bouc and the river at Arles, and thus obviate the necessity of navigating round the delta. In its upper and middle course the Rhone presents beautiful and varied scenery, enriched with a luxuriant southern vegetation, including grapes of superior quality, from which some of the finest wines of France are obtained: but below Avignon it passes through a broad, arid tract of country, and is bounded by swampy banks. The great natural commercial advantages of the Rhone have been considerably extended by means of numerous canals, which, by joining it to the Seine, the Loire, and the Rhine, have connected it with the Atlantic and the German ocean.

RHONE, a small but important inland department of France, bounded on the n.w. and s. by the departments of Saône-et-Loire and Loire; area, 1077 sq. m.: pop. '76, 505, -131. It lies almost wholly in the basin of the Rhone, and its great affluent the Saône; its eastern boundary is formed by these rivers. The surface is almost entirely mountainous or hilly. Of the 689,536 acres, more than one-half is under tillage. The principal productions are vines and mulberry-trees. The wines are famous for their excellent quality. Of the Mâcon wines, grown in the n., in the former district of Beaujolais, the best are the fine red wines of Chenas; of those grown in the s. of the department, called the *vins du Rhone*, the finest are the red wines of Côte Rôtie and the white wines of Condrieu. About 75,000 acres are in vineyards, and the amount of wine made annually is about 17,000,000 gallons. Silks (see Lyons) are manufactured extensively, and numerous other branches of manufacture are actively carried on. The industries of the department are mentioned under the names of the towns. The department is divided into the two arrondissements of Lyons and Villefranche. Capital, Lyons (q. v.).

RHONE, BOUCHES DU. See BOUCHES-DU-RHONE.

RHUBARB, *Rheum*, a genus of plants of the natural order *polygoneæ*, closely allied to *rumeæ* (dock and sorrel), from which it differs in having nine stamens, three shield-like stigmas, and a three-winged achenium. The species, which are numerous, are large herbaceous plants, natives of the central regions of Asia, with strong, branching, almost fleshy roots; erect, thick, branching stems, sometimes 6 or 8 ft. high; the stems and branches while in the bud covered with large membranous sheaths. The leaves are large, stalked, entire, or lobed; the flowers are small, whitish or red, generally very numerous, in large loose panicles of many-flowered clusters. The roots are medicinal; but those of different species seem to possess their medicinal properties in very different degrees, or these properties are developed very variously in different soils and climates, or according to other circumstances not at all understood. It is not known what species of rhubarb yields the valued rhubarb of commerce, which comes from inland parts of China or Chinese Tartary. Some of it reaches Europe by way of Canton, but the best is brought through Russia. It is commonly known, however, in Britain as *Turkey rhubarb*, because it was formerly brought by way of Natolia. It is carefully examined at Kiechta by persons appointed by the Russian government, so that the superior quality of all that is permitted to enter the European market is secured. Rhubarb is sometimes cultivated for its root in Europe, but the produce, *French rhubarb* and *English rhubarb*, is

very inferior to the rhubarb of the east, which it is often employed to adulterate. About 12 acres are devoted to the cultivation of rhubarb for its root near Banbury, in England, the species cultivated being *rheum raphaniticum*; but in France, besides this species, *R. undulatum* and *R. compactum* are employed. At Banbury the roots are taken up when three or four years old, and dried in drying-houses by a carefully regulated heat.

The leaf-stalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are much used, like apples, for tarts or pies, and also for making a kind of preserve. For these purposes different kinds of rhubarb are now very extensively cultivated in Britain, and in other temperate and cold countries, although it is only since the beginning of the present century that this valuable addition has been made to the plants of our kitchen-gardens; the species previously introduced having been cultivated merely as objects of curiosity, or for the sake of their roots. A number of species have been introduced into cultivation for their leaf-stalks. *R. palmatum*, the first species known, and which was once believed to yield the Turkey rhubarb, has roundish green leaf-stalks and half-palmate leaves, with pinnatifid pointed lobes. Its stalks are very inferior to every other kind in our gardens, both in size and quality, and the appearance of the leaf is very different. The other cultivated kinds, *R. undulatum*, *R. raphaniticum*, and *R. hybridum*, with endless varieties produced by the art of the gardener, all have broad, heart-shaped, undivided leaves, and the leaf-stalks flattened and grooved on the upper side. The leaf stalks are often also of a reddish color, which in some of the finest varieties pervades their whole flesh. Rhubarb is propagated by seed, and the plants yield a crop in the second or third year, or by dividing the roots. It prefers a light rich soil; and the ground ought to be heavily manured every year. The plants are placed three or four feet apart, according to the size of the variety. The varieties which, by excessive manuring, are made to produce the most gigantic stalks, are not nearly so good in quality as the smaller kinds. Rhubarb is cultivated on a most extensive scale by market-gardeners. It is forced in winter and early spring by being placed in pots within houses, or by having pots inverted over it, and dung and straw heaped around; and forced rhubarb is more tender and delicate than that which grows in open air.

There are few subjects in the *materia medica* which are so enveloped in obscurity as rhubarb. Even the period of its introduction into medicine is uncertain, for the description given by Dioscorides of the drug which he designates *rheon* does not correspond with our rhubarb. It was probably introduced into Europe by the Arabian physicians, somewhat previous to the time of Avicenna, in whose writings the term *rerund* occurs—a name still used, with a slight alteration, for rhubarb by the Persians and Hindus. In the British pharmacopœia no attempt is made to determine the species of *rheum* used in medicine, and there can be no doubt that the roots of several species are usually to be found in the drug-market. According to the pharmacopœia, the root, deprived of its bark, is imported from “Chinese Tibet and Tartary.” Little is known of the chemical composition of rhubarb root further than that it yields a yellow coloring matter termed *rheïn* ($C_{20}H_{16}O_6$), which is sparingly soluble in water, but dissolves freely in the alkalis, producing a reddish-brown liquid, from which the rheïn may be precipitated in flakes on the addition of acetic acid. Rhubarb is very liable to adulteration; and if the adulterated rhubarb be in a state of powder, the detection of the fraud is very difficult.

Rhubarb may be briefly described as a cathartic, an astringent, and a tonic. As a cathartic it chiefly operates by increasing the muscular action of the intestines; and when the cathartic action is over, there is generally more or less constipation, arising, as is usually supposed, from the astringent action then coming into play. The appetite is also improved, and the digestive process rendered more active, by the action of this drug. It must not be forgotten that the coloring matter of rhubarb passes into the serum of the blood and the secretions; and urine rendered red by its absorption has not unfrequently been confounded with bloody urine by practitioners ignorant of the very different chemical reactions of rheïn and the coloring matter of blood.

Rhubarb is one of the best aperients for general use in infancy, in consequence of the certainty of its action, and of its tonic and astringent properties, which are of much importance in the treatment of many infantile diseases, attended with imperfect digestion and irritation of the intestinal canal. In adults it is serviceable in chronic diarrhea and dysentery, when it is expedient to clean out the bowels. It is also a useful aperient in convalescence from exhausting disease, as being free from the risk of overacting; and for the same reason it is a useful medicine for persons who are constitutionally liable to over-purgation from trivial causes.

The official preparations are the *pulvis rhei compositus* (composed of powdered rhubarb, magnesia, and ginger, and popularly known as Gregory's powder or mixture—the average dose being a teaspoonful), the *pilula rhei composita* (a compound rhubarb-pill, composed of rhubarb, aloes, myrrh, hard soap, oil of peppermint, and treacle—the dose, as an aperient, being ten or fifteen grains), the *extractum rhei* (dose from five to ten grains), the *infusum rhei* (dose from two to four fluid-ounces), and the *tinctura rhei*, which is usually given in doses of about a dram, in association with other aperients.

RHUMB, or **RHOMB** (Lat. *rhombus*), a term introduced, according to Vitalis, into navigation by the Portuguese, and signifying at first a meridian, or especially the priu-

cipal meridian of a map. It then came to signify any vertical circle, whether a meridian or not, and hence any point of the compass. A ship is therefore said to sail on a rhumb when its head is kept constantly directed to the same point of the compass. The rhumb-line thus crosses all meridians at the same angle, and corresponds exactly to what is known as the *loxodromic lines* (q.v.). In Mercator's chart, the rhumb-line is a straight line (though not so in nature); but it must be carefully noticed that equal portions of it on the chart do not indicate equal distances on the surface of the globe, the divisions which are lowest in latitude always representing the greatest distance, and *vice versa*.

RHYME, or **RHIME**, is more properly, perhaps, written *rime*, as it does not seem to be derived from the Greek *rhythm*, but to be a native Teutonic word, from the same root, probably, as Ger. *reihe*, a row, verb *reihen*, to array; also *reihen*, a song or a chain-dance, of which *reim* may be only a variety. In Ang.-Sax., *rim-craeft*, meant the art of numbering; *riman*, to number; and thus *rime*, although a native Teutonic word, may ultimately be from the same Aryan root as the Greek *rhythm* (q.v.), which etymologists derive from *rheo*, to flow. In early English, rhyme (and the same is true of Ger. *reim* and the other forms of the word in other northern tongues as well as in the Romance) meant simply a poem, a numbered or versified piece (compare Lat. *numeri*, numbers = verses, versification); but it has now come to signify what is the most prominent mark of versification in all these tongues, namely, the recurrence of similar sounds at certain intervals. As there may be various degrees and kinds of resemblance between two syllables, there are different kinds of rhyme. When words begin with the same consonant, we have *alliteration* (q.v.), which was the prevalent form of rhyme in the earlier Teutonic poetry (e.g., Anglo-Saxon). In Spanish and Portuguese, there is a peculiar kind of rhyme called *assonance*, consisting in the coincidence of the vowels of the corresponding syllables, without regard to the consonants; this accords well with the character of these languages, which abound in full-toned vowels, but is ineffective in English and other languages in which consonants predominate. In its more usual sense, however, rhyme denotes correspondence in the final syllables of words, and is chiefly used to mark the ends of the lines or verses in poetry. Complete identity in all the parts of the syllables constitutes what the French call *rich rhyme*, as in *modèle, fidèle; beauté, santé*. But although such rhymes are not only allowed but sought after in French, they are considered faulty in English, or rather as not true rhymes at all. No one thinks of making *deplorè* rhyme with *explorè*. Rhyming syllables in English must agree in so far, and differ in so far; *the vowel and what follows it—if anything follow it—must be the same in both; the articulation before the vowel must be different*. Thus, *mark* rhymes with *lark, bark, ark*, but not with *remark*. In the case of *mark* and *ark*, the absence of any initial articulation in the last of the two makes the necessary difference. As an example of rhyme where nothing follows the vowel, we may take *be-love*, which rhymes with *fore-go*, or with *O!* but not with *lo*. To make a perfect rhyme, it is necessary, besides, that the syllables be both accented; *free* and *merrily* can hardly be said to rhyme. It is almost needless to remark, that rhyme depends on the sound, and not on the spelling. *Pough* and *enough* do not make a rhyme, nor *ease* and *decease*.

Such words as *roaring, de-ploring*, form *double rhymes*; and *an-nuity, gra-tuity, tri-ple rhimes*. In double or triple rhymes, the first syllable must be accented, and the others ought to be unaccented, and to be completely identical. In the sacred Latin hymns of the middle ages, the rhymes are all double or triple. This was a necessity of the Latin language, in which the inflectional terminations are without accent, which throws the accent in most cases on the syllable next the last—*do-lorum, vi-vorum; sup-placà, con-venià*. Although rhymes occur chiefly between the end-syllables of different lines, they are not unfrequently used within the same line, especially in popular poetry:

And then to see how ye're neglectit,
How *huff'd*, and *cuff'd*, and disrespeckit.

Burns.

And ice mast-high came floating by.

Coleridge.

(SEE LEONINE VERSES.)

When two successive lines rhyme, they form a *couplet*; three form a *triplet*. Often the lines rhyme alternately or at greater intervals, forming groups of four (*quatrains*) or more. A group of lines embracing all the varieties of meter and combinations of rhyme that occur in the piece, forms a section called a *stave*, sometimes a *stanza*, often, but improperly, a *verse*. In the days of acrostics (q.v.) and other conceits, it was the fashion to interlace rhymes in highly artificial systems; the most complex arrangements still current in English are the sonnet (q.v.) and the Spenserian (q.v.) stanza. Tennyson has accustomed the English ear to a quatrain, in which, instead of alternate rhymes, the first line rhymes with the fourth, and the second with the third.

It is a mistake to suppose that rhyme is a mere ornament to versification. Besides being in itself a pleasing musical accord, it serves to mark the endings of the lines and other sections of the meter, and thus renders the rhythm (q.v.) more distinct and appreciable than the accents alone can do. So much is this the case, that in French, in which the accents are but feeble, meter without rhyme is so undistinguishable from prose, that blank verse has never obtained a footing, notwithstanding the war once waged by French

scholars against rhymed versification. "The advantages of rhyme," says Guest (*English rhythms*), "have been felt so strongly, that no people have ever adopted an accentual rhythm without also adopting rhyme." The Greek and Latin meters of the classic period, depending upon time or quantity, and not upon accent, were able to dispense with the accessory of rhyme; but, as has been well observed by Trench (*Sacred Latin Poetry, Introduction, 1864*), even "the prosodic poetry of Greece and Rome was equally obliged to mark this (the division into sections or verses), though it did it in another way. Thus, had dactyls and spondees been allowed to be promiscuously used throughout the hexameter (q. v.) line, no satisfying token would have reached the ear to indicate the close of the verse; and if the hearer had once missed the termination of the line, it would have been almost impossible for him to recover it. But the fixed dactyl and spondee at the end of the line answer the same purpose of strongly marking the close, as does the rhyme in the accentuated verse; and in other meters, in like manner, licenses permitted in the beginning of the line are excluded at its close, the motives for this greater strictness being the same." It is chiefly, perhaps, from failing to satisfy this necessary condition, that modern unrhymed verse is found unsatisfactory, at least for popular poetry; and it may be doubted whether it is not owing to the classical prejudices of scholars that our common English blank verse got or maintained the hold it has.

The objection that rhyme was "the invention of a barbarous age, to set off wretched matter and lame meter," rests on ignorance of its real history. It cannot be considered as the exclusive invention of any particular people or age. It is something human, and universal as poetry or music—the result of the instinctive craving for well-marked recurrence and accord. The oldest poems of the Chinese, Indians, Arabians, etc., are rhymed; so are those of the Irish and Welsh. In the few fragments of the earliest Latin poetry that are extant, in which the meter was of an accentual, not quantitative kind, there is a manifest tendency to terminations of similar sound. This native tendency was overlaid for a time by the importation from Greece of the quantitative meters; yet even under the dominance of this exotic system, rhyming verses were not altogether unknown; Ovid especially shows a liking for them:

Quot cœlum stellis, tot habet tua Roma puellas;

and in the decline of classicity they become more common. At last, when learning began to decay under the irruptions of the northern nations, and a knowledge of the quantity of words—a thing in a great measure arbitrary, and requiring to be learned—to be lost, the native and more natural property of accent gradually reappeared as the ruling principle of Latin rhythm, and along with it the tendency to rhyme. It was in this new vehicle that the early Christian poets sought to convey their new ideas and aspirations. The rhymes were at first often rude, and not sustained throughout, as if lighted upon by chance. Distinct traces of the adoption of rhyme are to be seen as early as the hymns of Hilary (died 358), and the system attained its greatest perfection in the 12th and 13th centuries. In refutation of the common opinion, that the Latin hymnologists of the middle ages borrowed the art of rhyme from the Teutonic nations, Dr. Guest brings the conclusive fact, that no poem exists written in a Teutonic dialect with final rhyme before Otfried's *Erangelj*, which was written in Frankish about 870. Alliteration had previously been the guiding principle of Teutonic rhythms; but after a struggle, which was longer protracted in England than on the continent, it was superseded by end-rhymes.—See Guest's *History of English Rhythms* (2 vols., Lond. 1838), where the whole subject is learnedly and elaborately treated; Trench's *Sacred Latin Poetry, Introduction* (Lond. 1864); F. Wolf, *Ueber die Laits Sequenzen, und Leiche* (Heid. 1841).

RHYMER, THOMAS THE. See THOMAS THE RHYMER, *ante*.

RHYNCHONELLA, a genus of brachiopodous mollusca, characterized by its trigonal acutely-beaked shell, the dorsal valve of which is elevated in front and depressed at the sides, and the ventral valve is flattened or hollowed along the center. The genus is represented by two living species, the one from the icy seas of the north, and the other from New Zealand. The shells of both are black. No less than 250 species of fossil shells have been referred to the genus. They occur in all formations from the lower Silurian upward.

RHYNCHOPHORA. See WEEVIL.

RHYNCHOPS. See SKIMMER.

RHYTHM (Gr. *rhythmos*, any motion, especially a regulated, recurring motion; hence, measured motion, time, number), in its widest sense, may be defined as measured or timed movement, regulated succession. It seems to be a necessity for man, if movements of any kind are to be sustained for a length of time, that some more or less strict law of interchange should regulate the succession of the parts. It is even believed that the ground of this necessity may be discovered in the structure and functions of the human body. See Bain, *The Senses and the Intellect*. More particularly, in order that a number of parts may constitute a whole, or, at all events, a pleasing whole, a certain relation or proportion must be felt to pervade them. When exemplified in the arrangement of matter into visible objects, as in sculpture, architecture, and other plastic arts, rhythm is usually called *symmetry*. Rhythm applied to the movements of

the body produces the *dance*. "The rhythmical arrangement of sounds not articulated produces *music*, while from the like arrangement of articulate sounds we get the cadences of *prose* and the measures of *verse*. Verse may be defined as a succession of articulate sounds, regulated by a rhythm so definite that we can readily foresee the results which follow from its application. Rhythm is also met with in prose; but in the latter its range is so wide that we never can anticipate its flow, while the pleasure we derive from verse is founded on this very anticipation."

The rhythm of verse is marked in various ways. In Sanskrit, Græek, and Latin, during their classic periods, *quantity*, or the regulated succession of long and short syllables, was the distinguishing mark of verse. In the languages descended from these three ancient tongues, as well as in all the other Aryan languages, the rhythm depends upon *accent*. See METER. The recurrence of similar sounds, or *rhyme*, is also used, along with accent, to render certain points of the rhythm more distinct, as well as to embellish it. See RHYME.

RHYTHM, in music, the disposition of the notes of a musical composition in respect of time and measure. To rhythm, music is chiefly indebted for its order, perspicuity, intelligibility, and consequently its power and effect. The rhythmical value of a musical sound is the ratio which its duration bears to that of other sounds. See NOTE. A musical composition is made up of portions of equal rhythmic value, called *measures*, separated by vertical lines called bars, the length of the measure being indicated by a sign at the beginning of the movement. For the varieties of time and their signatures, see MUSIC. The first note in each measure is distinguished by a greater force or stress than the rest; that stress is called *accent*, and of the four measure-notes in common time, the third has also a subordinate accent, as has the third measure-note in triple time. There is also an irregular or rhetorical accent in music called *emphasis*, which may be laid on any part of the measure, and whose use is regulated by taste and feeling.

RHYTHMICAL MENTAL DISEASES. Certain affections become aggravated or mitigated at particular hours; certain others appear in paroxysms, to a certain extent, of regular duration and recurrence; and a third class is named quotidian, quartan, etc., from the precise and unvarying periods at which their access returns. The element of time, and of regular intervals of time, is chiefly characteristic of morbid conditions of the nervous system. In chorea and involuntary shrieking, singing, etc., a rhythm may often be detected, of which the patient is altogether unconscious. Not merely have movements of the eyelids and of the limbs presented a perfectly timed succession, but enses are recorded where the wild gesticulations and jactations of St. Vitus's dance have been regulated so as to correspond to popular airs. A person has been known to strike his breast with the hand for hours with the same exactitude as if measured by a time-piece. Those affected with tarantism are prompted to dance by the sound of music; and their movements are determined, it is affirmed, not by volition, but by the cadences of the tunes played in their hearing. The victims of the dancing mania in the 15th c. were similarly affected. In many forms of insanity there is seen a tendency to rhyming in words, as well as to rhythmical movements. A patient for three consecutive days vociferated incessantly words terminating in *-ation*.—Laycock, *Nervous Diseases of Women*, pp. 185, 314; Sauvage, *Nosologia Methodica*, tomus ii., p. 231; *Medical Critic*, *passim*.

RHYTTINA BOREALIS, a fish like formed mammal, belonging to the order *sirenia*, now extinct. It was discovered in 1741, by the Russian naturalist Steller, on an island in Behring's strait. They were then abundant, but were killed by hunters of sea-otters. In about 30 years from their discovery they were exterminated. The mature animal was about 22 feet long, and was herbivorous, feeding principally on sea-plants.

RIAZAN, a central government of Great Russia, extends s.e. from the government of Moscow. Area, 16,221 sq. m.; pop. '70, 1,477,493. The principal river is the Oka, which, after forming the boundary between the governments of Moscow and Tula, and part of the boundary between Moscow and Riazan, flows s.e. to the middle of the latter, then turning n., disappears across the border on the n.e. The Oka divides the government into two unequal parts, of which the northern is low in surface and sandy in soil, while the southern presents an elevated surface and a most fertile soil. The Don crosses the s.w. part of Riazan, but is not here navigable. The chief products are iron ores, limestone, wheat, oats, rye, millet, buckwheat, and vegetables. There are many remarkable good studs. Though the chief occupations are agriculture and horticulture, there are a number of important industrial establishments, as needle, cloth, and glass factories; cotton-mills, iron-works, tanneries, and soap and tallow works. Manufactured goods and corn are exported.

RIAZAN, a t. of Great Russia, capital of the government of the same name, stands on a branch of the Oka, near its junction with that river, 130 m. s.e. of Moscow. It was founded in 1208, became in 1487 the residence of the princes of Riazan, and was made chief town of the government of Riazan in 1778. The chief fragment of antiquity is the interesting old fort called the Kreml. There is a ferry here across the Oka, at which the products of the vicinity are shipped; 5,770,000 bushels of corn are exported annually. Pop. '67, 17,950.

RIB, in architecture, a projecting band or molding on an arched or flat ceiling. It is of universal use in all styles of Gothic architecture; the early Norman examples are simple square bands crossing the vault at right angles, the groins being plain angles. In early English, the groins and ridge are also ribbed, and all the ribs are molded. The ribs and their moldings are multiplied as the style advances, till the whole surface becomes covered with them in the fan-tracery vaults (q.v.). Plaster ceilings are sometimes elaborately ornamented with patterns formed by ribs, especially in the styles of the times of Elizabeth and James I.

RIBAUT, JEAN, d. 1565; b. France; left Dieppe in 1562, in command of two vessels. Sailed along the Florida coast, and anchoring at Port Royal, built fort Charles, near the present Beaufort. He left 26 colonists, and returned to France, from which, on account of the civil wars, he was unable to return till 1565. Meanwhile the colony had been abandoned. A settlement of French Protestants had been made in 1564, on the May, now the St. John's river. Ribault came over with 7 vessels the next year, and assumed command of the colony. Soon after his arrival a Spanish squadron came with orders to kill all the Protestants in the settlement. Ribault at first went out to sea, but sailing for St. Augustine afterward to fight the Spaniards, was wrecked, and his whole squadron lost. Meanwhile Menendez had taken the fort on the May, and massacred 200 persons. Ribault, with 500 men, traveling toward the settlement, was surprised by Menendez, and with most of his party put to death.

RIBBON, in heraldry, a diminutive of the ordinary called the bend, of which it is one-eighth in width.

RIBBON. See SILK AND SILKWORM.

RIBBON-FISH, the popular name of a family of acanthopteron fishes called *teniidæ*, or more properly, *tenioide*, by naturalists (from *tenia*, a tape-worm), on account of their compressed and elongated form. Notwithstanding their peculiarity of form, they are nearly allied to the *scomberidæ*, or mackerel family. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail-fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being deep-sea fishes, and mere occasional visitants of the coasts. Owing to the delicacy of their frame, perfect specimens are seldom obtained. Species exist which are nine or ten feet long, not six inches deep, and scarcely an inch thick. See BAND-FISH, DEALFISH, and GYMNETRUS.

RIBBONISM, the name of a system of secret associations among the lower classes in Ireland, the objects of which have long been a subject of much suspicion and of considerable controversy. The first origin of the associations known under this name is involved in much obscurity. From the middle of the last century, secret organizations, variously designated, but for the most part connected with agrarian discontent, have from time to time arisen in Ireland. The earliest of these appears to have been that of the Whiteboys, who appeared about the year 1759. Later in the century the fierce and sanguinary strife to which the relaxation of some of the penal laws under which the Catholics had long suffered gave occasion in the north, and which resulted in the Protestant organization already described under the head Orangemen (q.v.), led to the Catholic counter-organization known by the name of defenders; but this association seems to have been for the time purely local, being confined to Armagh and the neighboring counties, in which the violences of the Protestant party had originated. The severely repressive measures adopted by the government on the outbreak of the rebellion of 1798, and continued for several years, prevented any notable progress of the Catholic organization; and when at length, about 1806, such an organization was initiated, it was of necessity conducted with the utmost secrecy. The name by which the members of these associations were now known was "Threshers." They appeared chiefly in Sligo, Mayo, Leitrim, Longford, and Cavan; and it is worthy of note that one of their professed objects was to resist the payment of tithes, and even of the stipend commonly, although freely, paid to the Catholic priests by members of their congregations. The associations called (it is supposed from the badge worn by the members) by the name of ribbon societies first appeared about 1808, and originated in Armagh, whence they spread to Down, Antrim, Tyrone, and Fermanagh. There can be no doubt that their real object was a combined action, partly for self-defense, partly also probably for directly antagonistic action against the now wide-spread and formidable Orange confederacy. Their operations from the first were for the most part limited to the counties, chiefly in the n. and n.w., in which the Orange associations were sufficiently numerous to be formidable; nor do they appear at any time to have had a footing in the purely Catholic counties where there were few or no Orangemen to be encountered. The secret associations of the other districts—the midland, southern, and south-eastern counties—as the "Carders" in East and West Meath, in Roscommon, and part of Mayo; and the "Shanavests" and "Caravats" in Tipperary, Kilkenny, Cork, and Limerick, had little of the religious element in their organization, being mainly due to discontents arising from alleged agrarian and social grievances.

The ribbon association also, no doubt, addressed itself to the same agrarian and social grievances; but it is plain that its direct and immediate object was antagonism to

the Orange confederation, to which, in some respects, it bore considerable resemblance, although it was deficient in that complete and wide-spread organization which so remarkably distinguished the former body. The ribbon association was divided, like the Orange, into lodges, and the members of each lodge were bound by a secret oath to "be true to each other," and "to assist each other in all things lawful." Stated meetings of the lodges were held, and small money contributions were exacted, both at entrance into the association, and on each occasion of meeting. The members, moreover, were known to each other by certain secret signs and pass-words, which were frequently changed, and some of the specimens of which were of a singularly absurd and ludicrous character. But there does not appear to have been anything like that complete and curious scheme of a "central grand lodge," with its subordinate hierarchy of "county," "district," and "private" lodges, which characterized the great rival confederation. A still more striking and important difference was in the class of men with which the ribbon societies were recruited. They are proved to have consisted exclusively of the very lowest classes, the humbler peasantry, farm-servants, and operatives of the least intelligent class. No trace appears among them of what is so striking in the Orange association—the co-operation, or even the countenance of the gentry, the clergy, the commercial class, hardly even of the farming class, except a few of the sons of farmers of the lowest grade. On the contrary, an attempt which was made, in a committee of the house of lords in 1839, to connect the Catholic clergy and the Catholics generally with the ribbon association, proved a signal failure, as did also the attempt to show that the objects of the association were the overthrow of British rule in Ireland; and it was proved that the Catholic clergy, from the first origin of these associations, have persistently opposed them, and employed all their influence, and even their spiritual authority, to deter their flocks from taking any part in them.

From the absence of all statistical information, and from the rude and illiterate material out of which alone these societies are formed, it is impossible to offer any estimate of their number or extent. That they still exist becomes abundantly clear on every occasion of party-strife which arises in Ireland; but they appear to have been replaced in several parts of the country by newer associations, such as the "Phenicians," the "Brotherhood of St. Patrick," and the "Fenians," an association which is said to possess large affiliations in America, and among the Irish in the manufacturing towns of England and Scotland. See FENIANS.

RIBBAUVILLE (Ger. *Rappoltsweiler*), a small manufacturing t. of Alsace, pleasantly situated amid vineyards, 34 m. s.s.w. of Strasburg. Excellent wines are made, and cotton goods are manufactured. The town is overlooked by the Vosges mountains, along the crests of which runs a wall or rampart, built of unhewn stones, without cement, and from 8 to 10 ft. high. It is of unknown antiquity, and is called the *heidenmauer*, or pagan wall. Pop. '75, 5,785.

RIBERA, JOSE, called SPAGNOLETTO ("the Little Spaniard") was b. at Xativa, near Valencia, in 1688, and died at Naples in 1656 or 1659. He studied a few years with Francesco Ribalta, a Spanish painter of eminence, but resolved to visit Italy; and after working hard at Rome, and studying the greatest masterpieces in some other states, he went to Naples, where, attracted by the novelty and boldness of Caravaggio's style, he adopted it, and became the ablest painter among the *naturalisti*, or artists whose treatment of subjects was based on a vigorous and powerful, but generally coarse and vulgar representation of nature, in opposition to that formed on the study of conventional or academic rules. He settled in Naples, where he became court-painter, and executed numerous important commissions in that city; and it is there that his best works are to be seen. Salvator Rosa and Guercino are numbered among his pupils. He executed about eighteen or twenty etchings, all marked by force and freedom.

RIB-GRASS. See PLANTAGINÆ.

RIBS are elastic arches of bone, which, with the vertebral column behind, and the sternum or breast-bone in front, constitute the osseous part of the walls of the chest. In man, there are 12 ribs on each side. The first 7 are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed *costo-sternal* or *true ribs*; while the other five are known as *false ribs*, and the last two of these, from being quite free at their anterior extremities, are termed *floating ribs*. A glance at a skeleton, or at a plate representing the articulated bones, will show that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior; this obliquity increasing to the 9th rib, and then slightly decreasing. They increase in length from the first to the eighth, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*. On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facette being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebrae, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the

tuberosity or tubercle, from whence the shaft commences. On the lower surface of this tubercle is a small oval surface, which articulates with a corresponding surface on the upper part of the transverse process of the lower of the two contiguous vertebræ. The shaft presents an external convex, and an internal concave surface. A little in front of the tubercle, the rib is bent inward, and at the same time upward, the point where this bending takes place being called the angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of mammals are mostly connected, as in man, with the bodies of two vertebræ, and with the transverse processes of the posterior one. In the monotremata, however, they articulate with the vertebral bodies only; while in the cetacea, the posterior ribs hang down from the transverse processes alone. Their number, on each side, corresponds with that of the dorsal vertebræ. The greatest number, 23, occurs in the two-toed sloth, while in the cheiroptera, 11 is the ordinary number. In birds, each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a "diverging appendage," which projects backward over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebræ here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in mammals, but by true osseous sternebra ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the chelonian reptiles, the ribs (as well as the vertebra and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of ankylosed ribs united by dermal plates. In the crocodiles, there are only twelve pair of true or dorsal ribs; while in the other saurians, and in the ophidians, the ribs are usually very numerous. In the frogs, there are no true ribs; the reason probably being, that any bony element in their thoracic walls would interfere with the enormous thoracic-abdominal enlargement which these animals periodically undergo at the breeding period.

In the language of the transcendental anatomists, a rib is to be regarded as a *pleuropophys*—one of the elements of a typical vertebra (q. v.).

RIBS. FRACTURE OF THE, is a very common surgical accident, resulting from blows or falls upon the chest. Ribs may, moreover, be broken by mere pressure, as when persons are severely crushed in a crowd; and instances are on record in which, in the case of aged persons, the ribs have been actually fractured in violent coughing.

The treatment consists in the application of a broad flannel roller around the chest, so tightly as to prevent, as far as possible, all movement of the ribs, and to render the respiration abdominal rather than thoracic. The bandage must be prevented from falling by the addition of shoulder-straps; and in order to prevent the shoulder-blade from moving, and thus disturbing the broken ribs, some surgeons confine the arms to the side of the body. If one or both of the extremities of the fractured rib should perforate both the pleuræ, and wound the lung, air escapes in the act of inspiration from the lung into the pleural cavity, and from thence through the wound in the costal pleura into the cellular or areolar tissue of the trunk, giving rise to *emphysema*, in the form of a soft puffy tumor, that crepitates and disappears on pressure.

RICARDO, DAVID, a political economist and statesman, was b. in London on the 19th of April, 1772. He was of Jewish extraction; and his father, who was a respectable member of the stock exchange, brought him up to his own business. There was an alienation between them on account of the son marrying out of the Jewish persuasion, and conforming to Christianity. Young Ricardo practiced in the exchange until the year 1818, and whether from his own skill as a broker, or the favor extended to him on account of the position in which he was placed by his conformity, he realized a large fortune, preserving throughout his career in business an honorable reputation. While thus practically occupied, he was ardently working his way back to the first principles of political economy, and especially the finance department of it. In 1810 he produced a notable sensation by his pamphlet entitled *The High Price of Bullion a Proof of the Depreciation of Bank-notes*. The title was a condensation of the principle worked out in the treatise, which gave one of the earliest distinct announcements of the principle of a metallic basis, and the propensity that a paper currency always has to redundancy, if it be not in some form or other restrained by the operation of such a basis. This was followed by several pamphlets, each in its turn a success in securing fame and influence. In 1817 appeared his principal work *On the Principles of Political Economy and Taxation*. He had previously in one of his pamphlets touched on the most important feature of this work—the elucidation of the true theory of rent, as not being incidental and casual, like the profits of stock, but a fund that must, under certain conditions of population, come into existence, whoever may draw it (see RENT). Some critics of Ricardo found that the elements of the theory were given in *The Bee* by Dr. Anderson (see ANDERSON, JAMES). Ricardo, however, who probably had not read *The Bee*, reached his conclusions in a different and original form, and from his happy method of elucidation, at once secured a general adhesion to the soundness of the theory, which was strengthened by comparing it with Anderson's remarks. Ricardo's work is one of the clearest and least tedious of all books on

political economy. Like almost all works, however, written before free trade actually showed its power, it narrows the influence of the elements from which the riches of the world can be increased. Like Malthus, he was unable to anticipate the effect of an industrious people having the whole world for their market, and spoke of population outrunning subsistence, and the wages of labor being measured by the price of commodities. In 1818 he entered parliament, and kept his seat till his death. As he had a very clear method of announcing a principle, and being known as a successful man of business, his speeches had perhaps more influence in all matters of trade and money than those of any other member in the present century. He was a zealous student of geology, chemistry, and other sciences. He died Sept. 11, 1823.

RICASOLI, BETTINO, Baron, b. at Florence, Mar. 9, 1809; is descended from a very ancient Lombard family, which established itself in Tuscany in the 13th century. Ricasoli studied at Pisa and Florence, and from an early period of his life was imbued with a desire to ameliorate the civil and religious condition of his country. His friends and associates were men like Poerio, Pepe, Coletta, Giordani, Nicolini, etc. But he was averse to revolution, and finding no legitimate opening for himself in political life, quietly subsided into a country gentleman, and set about "improving" his estates. He is one of the best agriculturalists in Italy, and has written on the cultivation of the vine, of the olive, and of the mulberry. His wines of Chianti have gained for him the cross of the legion of honor. In 1847 he appeared as a politician; but he hoped to obtain liberty and good laws from princes, and not from the people, and when Leopold II. fled to Gaeta, he retired from public life. Very soon, however, he joined with other Tuscan gentlemen, and after the defeat of Novara, he overthrew the government of Guerrazzi, and recalled the grand duke, trusting to the constitutional promises given by the latter. Leopold returned, accompanied by the Austrians; and Ricasoli, indignant at this treachery, sent back his decoration to the prince, and shut himself up in his castle of Brolio—addicting himself more than ever to agricultural pursuits. For ten years he worked successfully at the drainage of the Tuscan Maremma (q.v.). In 1859, when Tuscany wished to take part in the war of Italian independence, Ricasoli reappeared. The grand duke fled, and Ricasoli was made dictator of Tuscany. After Villafranca he remained alone in the government, beset by the French emissaries, who were advising him to recall Leopold II. Ricasoli fiercely refused to do so; he wished the annexation to Piedmont; and to those who spoke of the dangers he was incurring, he answered in those words which history will never forget: "*Dojo Villafranca ho sputato sulla mia vita*"—literally, "After Villafranca I have spit upon my life." His obstinacy saved Italy, and produced the unity of the peninsula. On the death of Cavour (1851), Ricasoli was called to the ministry, and by another abrupt and decided act he promulgated political and administrative unity. His cabinet, undermined by Ratazzi, did not stand, and he therefore resigned (Mar., 1862). Ricasoli returned to power in June, 1866, and retired in April the following year, when he was succeeded by Ratazzi.—See M. Luigi Passerini's *Genealogia e Storia della Famiglia Ricasoli* (Florence, 1861).

RICCI, MATTEO, a celebrated Italian, founder of the Jesuit missions to China, was born at Macerata, in the marches of Ancona, Oct. 6, 1552; and after studying law at Rome, entered the society of Jesus in 1571. Six years later he accompanied to India père Valignan, "inspector-general of the eastern missions." On account of his fine combination of zeal and tact, he was chosen by his superior to introduce a knowledge of the Christian religion into China, and after preparing himself for the arduous undertaking by a study of the Chinese language at the Portuguese settlement of Macao, he endeavored to effect an entrance into the empire. But his first efforts were vain, and it was not till 1583 that the Jesuit fathers obtained permission to settle at Tchao-king-fu. Ricci quickly saw that it was hopeless to attempt the conversion of the Chinese except by accommodating himself to their intellectual tastes and beliefs, as far as the principles of his religion permitted. Aware of the value which the ruling class—the mandarins—attached to literary skill, he executed and published a Chinese *Map of the World*, and also a little *Catechism*, in which he set forth only such portions of Christianity as embodied the general principles of morality. These two productions won Ricci a high reputation among the Chinese *literati*; the most illustrious mandarins came to visit him, and expressed their esteem for his character and talents. In 1595 he boldly resolved to go to Peking, believing that he could accomplish far more as a religious propagandist in the metropolis than elsewhere. Having obtained permission from his superiors to assume the dress of a Chinese scholar, he set out in the train of a mandarin, who did not allow him, however, to proceed further than Nankin. Expelled thence, he was obliged to return homeward; but at Nam-tchang-fu, the indomitable and adroit priest composed two treatises, entitled the *Art of Memory*, and a *Dialogue on Friendship*, in imitation of Cicero, which so pleased the taste of the Chinese that they ranked them along with their most esteemed books, and the fortunate author was allowed to proceed north. He reached Peking, and although he could not obtain an interview with the sovereign, he was permitted to fix his residence at Nankin, the second city in the empire, where his fame as a scholar increased from day to day. In 1600 he and his companions were allowed to settle at Peking, and even to build a church. He spent the remainder of his life in teaching mathematics and other sciences, in writing works of a secular as well as a religious kind,

and in using his great influence with the king, the court, and the learned classes generally to obtain a favorable attention to the claims of that religion which he represented. Ricci made several striking conversions, and through his zeal missionary establishments were set up in the principal cities of China. He died May 11, 1610, and was universally mourned. In the annals of the Chinese empire he is designated sometimes *Lì-na-teou*, and sometimes *Sì-thai*. The most important (for us) of his numerous writings, are his memoirs, published by père Trigault, under the title of *De Christiana Expeditione apud Sinas suscepta ab Societate Jesu, ex M. Ricci Commentariis Libri V.* (Augsb. 1615; Lyons, 1616), which contains a vast number of valuable observations on the geography and history of China. The family of Ricci possess 66 interesting letters of the great missionary.

RICE, *Oryza*, a genus of grasses, having panicles of one-flowered spikelets, with two very small pointed glumes; the florets compressed, the palea strongly nerved, awned or awnless, six stamens, one gemma and two feathery stigmas. The only important species is the COMMON R. (*O. sativa*), one of the most useful and extensively cultivated of all grains, supplying the principal food of nearly one-third of the human race. It seems to be originally a native of the East Indies, but is now cultivated in all quarters of the globe, and almost wherever the conditions of warmth and moisture are suitable. It is adapted to tropical and subtropical climates, rather to the latter than the former; and requires much moisture, rather, however, in the soil than in the air. Rice is an annual, varying from one foot to six feet in height. There are many other distinguishing characters of the varieties in cultivation; some having long awns, and some being awnless; some having the chaff (*palea*), when ripe, yellow, white, red, black, etc. The seed or grain of rice grows on little separate stalks, springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and of oats. Rice requires a moist soil, sometimes flooded; and the cultivation of it has in many places been attended with an increase of intermittent fevers, and of general unhealthiness, the rice-fields being artificially flooded at certain seasons. The cultivation of rice is most extensively carried on in India, China, Cochin-China, and other s.e. parts of Asia, Japan, Egypt, South Carolina, Georgia, and other southern states of North America. The quantity exported from India, whence we obtain our chief supplies, was, in 1871, estimated at 16,336,335 qrs., valued at £4,468,000. The total import into this country in 1875 was 6,678,452 qrs., value £2,991,354. In some parts of the east, canals are carried along the sides of hills, in order to the irrigation of land for the cultivation of rice. In Carolina, rice is sown in rows, in the bottom of trenches, which are about 18 inches apart; the trenches are filled with water to the depth of several inches, till the seeds germinate; the water is then drawn off, and afterward the fields are again flooded for rather more than a fortnight, to kill weeds. They are flooded again, when the grain is near ripening.—In Europe, the cultivation of rice is confined to the most southern regions. It is most extensively carried on in the plains of Lombardy, and in Valencia in Spain. Attempts have been made to cultivate it in more northern parts of Europe, but without success. Marshy situations, where there is always the same abundance of water, are not so suitable to rice as those in which the supply of water is regulated according to the season and the growth of the plant.

Like most cultivated plants, it is very liable to variation, and in India and Ceylon at least, 120 known varieties are cultivated. The best of all rice known in the market is that of Carolina, yet the introduction of rice into that country took place only about the last years of the 17th or the first of the 18th century. Its cultivation there, however, rapidly extended.

Rice is known in India as *paddy*. Another use of this name is to designate rice in the husk.

In China, rice is generally sown pretty thickly on very wet land, and afterward transplanted to the land which it is finally to occupy. The plants *tiller* or spread at the root very much, so that each sends up several or many stalks. The rice-grounds are carefully kept clear of weeds, although often so wet that a man cannot walk in them without sinking to the knees. In many parts of China, and in other warm countries, it is common to obtain two crops of rice in a year.

Rice is shelled and quickly dried before being brought to market. Good Indian rice has the following composition:

	Per cent.
Moisture.....	13.00
Nitrogenous matter.....	7.44
Starch.....	77.63
Fatty or oily matter.....	0.70
Ash.....	1.23

100.00

Rice contains, therefore, according to the prevalent views of modern chemists, a smaller amount of *flesh-forming* substances, and a larger amount of *fat-forming* or *heat-giving* substances than any other grain. As a food, it is peculiarly well adapted for hot

climates, as it appears to be almost a cure for dysentery and other bowel complaints, independently of which it is a sufficiently nutritious food without being heating. Owing to the small quantity of gluten which it contains it is capable by itself only of an imperfect fermentation, and is unfit for being baked into bread. It is, however, subjected to fermentation in many countries. The beer made from rice by the Japanese is called *saki*, and is in general use among them; but before being drunk, it is heated in kettles. Several kinds of *rice wine* are made by the Chinese, some of them highly esteemed, and very intoxicating. A spirit is distilled from the lees, called *shou-choo* or *sam-choo*. The common arrack (q.v.) of the east is made from rice, and rice is also employed to a very great extent by distillers in Britain.

Rice starch is made in considerable quantity in Britain. It is sold under the name of *patent starch*, and is used in laundries and muslin manufactories. The straw of rice is used to make straw-plait for bonnets.

The refuse of rice, which remains when it is cleaned for the market, and consists of the husk, broken grains, and dust, is valuable as food for cattle. It is known as *rice-meal* and *rice-dust*.

CANADA RICE (*zizania aquatica*), the WILD RICE of North America, is a species of grass quite different from the true rice, and of a different genus. It is common in North America, and particularly abundant in the north-western parts of it; growing in miry places or shallow water, often in the margins of lakes. It has a culm 7 to 8 ft. high, with broad diffuse leaves, and a large terminal panicle of male flowers, with a spike of female flowers at the summit. The flowers have six stamens. The seeds are about half an inch long, slender, farinaceous, affording very good meal, and much used by the Indians where the plant abounds. Attempts to introduce this plant into Britain have hitherto proved unsuccessful; but, there are many northern regions apparently more suitable to it, and it has not received all the attention it deserves.

RICE (*ante*). The origin of the growth of rice in America is referred to the latter part of the 17th c., when a vessel from Madagascar is said to have brought a sack of the grain to Charleston, S. C., which was planted there and yielded largely. The culture spread, and eventually it became the staple product of that state, and was nowhere else grown so extensively until after the war of the rebellion. The mode of culture best adapted to the plant in South Carolina has been found to be by irrigation, and it is chiefly grown where the land is overflowed by the tides. The cultivation of rice spread rapidly from the beginning into most of the southern states, and even so far north as Missouri, Tennessee, and Illinois. But of late years Louisiana has been the most successful of any state in its cultivation. There it is grown on lowlands subject to overflow from the river, with due precautions against a possible crevasse. The water is conveyed by ditches and laterals, and is alternately turned on and drained off, as the condition of the plant and its progress may demand. When mature the water is finally drained off, and the grain is cut and left to dry. After thrashing, it is winnowed and placed in sacks, ready for the mill or market. The "upland" rice is dry-cultivated, and is claimed by some planters to be better than the lowland. It is grown upon high and dry land, and, after the manner of other grain, the yield is not so generous as with the lowland. The increase of rice cultivation in Louisiana was due to the blockade of the s. Atlantic ports during the war. In 1863-64 it amounted to only 21,461 sacks; in 1869-70 it had increased to 100,748 barrels. After this there was a falling off, and it did not reach the same figure until 1875, when it was 104,963 barrels, equivalent to about 24,000,000 pounds. In 1849 the total rice product of the United States was 215,313,497 pounds; in 1859, 187,167,032; in 1869, 73,635,001. In North Carolina rice culture is practically restricted to a small area of tide-water lands on the cape Fear river. Georgetown district, in South Carolina, is the most northerly portion of the tide-land rice districts of the south, and supplies most of the seed to the other portions of our southern rice-field. The imports and exports of rice for the ten fiscal years ending 1877 were as follows:

YEARS.	IMPORTS.		FOREIGN RE-EXPORTS.		DOMESTIC EXPORTS.		TOTAL EXPORTS.	
	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.
1868.	59,140,707	\$1,636,492	11,908,953	\$403,941	3,079,043	\$170,357	14,987,996	\$574,298
1869.	53,065,191	1,325,231	8,868,664	284,632	2,232,833	145,934	11,101,497	430,466
1870.	48,123,939	1,007,612	15,212,833	454,316	2,133,014	137,655	17,345,847	581,971
1871.	64,655,827	1,876,786	10,212,920	280,463	445,842	22,502	10,658,762	302,965

RICE, a co. in central Kansas, drained by the Arkansas and Little Arkansas rivers; crossed by the Atchison, Topeka and Santa Fé railroad; 900 sq.m.; pop. '80, 9,292—8,549 of American birth. The surface is mostly prairie. The soil is fertile. The principal productions are corn and wheat. Co. seat, Lyons.

RICE, a co. in s.e. Minnesota, drained by Cannon and Straight rivers; intersected by the Chicago, Milwaukee and St. Paul railroad; about 500 sq.m.; pop. '80, 22,480—15,691 of American birth. The surface is level and fertile, and there are several small lakes; wheat, corn, oats, hay, cattle, and dairy products are the staples. Limestone is found. Co. seat, Faribault.

RICE, ALEXANDER HAMILTON, LL.D., b. Mass., 1818; educated at Union college. He became a large paper manufacturer, served in the Boston common council, and was mayor of that city 1857-59. He was member of Congress 1859-67, and governor of Massachusetts 1875-78.

RICE, DAVID, 1733-1816; b. Va.; graduated at Princeton college in 1761; ordained pastor of the Presbyterian church, Hanover, Va.; in 1783 went to Kentucky, where he labored 15 years. He assisted in establishing Hampden Sidney college, and was a trustee of Transylvania university. He published *Essay on Baptism*; *Lecture on Divine Decrees*; *Slavery Inconsistent with Justice and Policy*; *Letters on Christianity in the Weekly Record*.

RICE, LUTHER, 1783-1836, b. Mass.; graduated at Williams college, 1810; studied theology at Andover seminary, and was one of the first American missionaries to India. He became a Baptist and returned to this country in 1813 to interest the churches of that denomination in the missionary cause. In the latter part of his life he settled in Virginia and was prominent in founding the Columbian college, Washington, D. C.

RICE, WILLIAM NORTH, PH.D., b. Mass., 1845; graduated at the Wesleyan university, Middletown, Conn., in 1865; Sheffield scientific school, Yale college, 1867; also studied at the university of Berlin; ordained in the Methodist Episcopal church in 1872; elected professor of geology and natural history in the Wesleyan university in 1867. He has already taken high rank as a broad student, a careful thinker, and an accurate writer.

RICE, INDIAN. See **RICE (CANADA RICE)**, *ante*.

RICE-PAPER. See **PAPER**.

RICE-PAPER TREE. See **ARALIA**, *ante*.

RICH, a co. in n. Utah, bordering on Idaho, drained by Bear river and its creeks; 960 sq.m.; pop. '80, 1263-934 of American birth. The surface is mountainous; wheat, grass, and oats are produced in the valleys. Co. seat, Randolph.

RICH, CLAUDIUS JAMES, 1787-1827; b. France; of English parentage, educated at Bristol, England; at a very early age became conversant with the Arabic, Hebrew, Syriac, Persian, and Turkish languages. In 1804 went as a writer to Bombay, being a cadet in the East India co. He remained there a year and was appointed secretary to Mr. Lock, consul-general to Egypt, but on account of the death of that official was relieved from duty, and traveled through Palestine and Syria disguised as a mameluke; sailing from Bassorah to Bombay. In 1807 he resided in Bombay with sir James Mackintosh, subsequently marrying his daughter. In 1808 he went to Bagdad, and during a residence of six years made a valuable collection of manuscripts, gems, and coins. In 1811 he published *Memoirs on the Ruins of Babylon*; and in 1818, after the second visit to the site, a *Second Memoir on Babylon*. He died at Sheeraz, Persia, awaiting instructions. His collection of oriental manuscripts, coins, etc., is in the British museum.

RICH, EDMUND, Saint; 1195-1242; b. England; went to school at Oxford, and made a vow of celibacy; studied theology at the university of Paris, and lectured there on the Scriptures; taught philosophy at Oxford, 1219-26; prebendary and treasurer of Salisbury cathedral, 1219-22; consecrated archbishop of Canterbury in 1233; opposed the marriage of Simon de Montfort with Eleanor, countess-dowager of Pembroke, and excommunicated them in 1238; retired in 1239 to the Cistercian abbey of Pontigny, France, and died at Soissy in Champagne. He was canonized in 1246 by Innocent IV. Among his works are *Constitutions*, in 36 canons; *Speculum Ecclesie* in vol. iii. of *Bibliotheca Patrum*.

RICHARD I., King of England, surnamed **CŒUR DE LION**, was the third son of Henry II. by his queen Eleanor. He was born at Oxford in Sept., 1157. In the treaty of Montmirail, entered into Jan. 6, 1169, between Henry and Louis VII. of France, it was stipulated that the duchy of Aquitaine should be made over to Richard, and that he should do homage for it to the king of France; also, that he should marry Adelais, youngest daughter of Louis. In 1173 Richard joined his mother and his brothers Henry and Geoffrey in their rebellion against the king. The rebels submitted in Sept., 1174, when two castles in Poitou were allotted to Richard. In 1183 a second family feud broke out in consequence of Richard refusing to do homage to his elder brother Henry for the duchy of Aquitaine. In this war his father sided with Richard against Henry and Geoffrey. It was ended by the death of prince Henry, when Richard, actuated probably by jealousy of his youngest brother John, declared himself the liegeman of France for his possessions in that country. This step led to a war between the king of England and Philip of France, in which Richard fought against his father. The balance of success being decidedly with France, a treaty in accordance with this fact was about to be executed, when, by the death of Henry II., on July 6, 1189, Richard became king of Eng-

land. He landed in his own country on Aug. 15, 1189, and was crowned in Westminster abbey on Sept. 3 following. In the hope of gaining salvation, and with the certainty of following the occupation which he loved best, he now set out with an army to join the third crusade, then about to leave Europe. He united his forces to those of France on the plains of Vezelai, and the two armies (numbering in all 100,000 men), marched together as far as Lyons, where they separated and proceeded by different routes to Messina, where they again met. Here Richard betrothed his nephew Arthur to the infant daughter of Tancred, king of Sicily, with whom he formed a close alliance. The Sicilian throne was at that time claimed by the emperor Henry VI.; and the alliance with Tancred, from this cause, afterward turned out a very unlucky one for Richard. Having settled a difference which now arose between him and Philip respecting his old engagement to Philip's sister Adelaide, the English king, on April 7, 1191, sailed from Messina for Cyprus, carrying along with him Berengaria, daughter of Sancho VI., king of Navarre. He had fallen in love with this princess, and he married her in the island of Cyprus, where he halted on his way to Palestine. But even love did not make him forget his favorite pastime of war: he attacked and dethroned Isaac of Cyprus, alleging that he had ill-used the crews of some English ships which had been thrown on his coasts. Having then presented the island to Guy of Lusignan, he set sail June 4, 1191, and on the 10th of the same month he reached the camp of the crusaders, then assembled before the fortress of Acre. The prodigies of personal valor which he performed in the Holy Land have made the name of Richard the lion-hearted more famous in romance than it is in history. The man was the creation and impersonation of his age, and the reader who follows his career may perhaps be more interested than he would be by the lives of greater men, or by the history of a more important period. On Oct. 9, 1192, he set out on his return to England. After some wanderings and adventures, he became the captive of the emperor Henry VI., who shut him up in a castle in the Tyrol. John, meanwhile, ruled in England, and he and Philip of France had good reasons for wishing that Richard should never return to his kingdom. He disappointed them; not, however, until he had paid a heavy ransom, and even, it is said, agreed to hold his kingdom as a fief of the empire. On Mar. 13, 1194, he found himself once more in England. His brother John, who had acted so treacherously toward him, he magnanimously forgave, but with Philip of France he could not deny himself the pleasure of a war. In the contest which followed he was generally victorious, but in the end it proved fatal to himself. He was killed by an arrow shot from the castle of Chalus, which he was besieging, on Mar. 26, 1199. If Richard had the vices of an unscrupulous man, he had at least the virtues of a brave soldier.—See *Chronicles and Memorials of Richard I.*, by W. Stubbs, from MS. in lib. of Corpus Christi col., 1864.

RICHARD II., King of England, the second son of Edward the Black Prince and Joanna of Kent, was born at Bordeaux on April 3, 1366. He succeeded to the throne on the death of his grandfather, Edward III., June 28, 1377. He being a minor, the government was vested in a council of twelve, from which were excluded the king's three uncles, John of Gaunt, duke of Lancaster; the earl of Cambridge, afterward duke of York; and the earl of Buckingham, afterward duke of Gloucester. This arrangement is, however, supposed to have been collusive, and intended to lull the popular suspicion of Lancaster, under whose control the council really was. The reign of Richard is interesting to the student of English constitutional history. We find the recently established house of commons eagerly pressing forward to procure a share of political power, by means of the efficient engine of which it had then acquired the sole control—the right of taxation. Again, we find the laboring classes now beginning to aspire to be freed from the state of bondage in which they had hitherto been kept. The famous capitation tax, imposed in 1380, gave rise in the following year to the rebellion of Wat Tyler (q.v.). In June, 1382, Richard was married to Anne of Bohemia, daughter of the emperor Charles IV. The next two years were occupied with a war with France, transferred in 1385 to Scotland, where for a while the king conducted it in person. In the absence of John of Gaunt in Spain, the duke of Gloucester had put himself at the head of affairs; and an attempt which Richard made at this time to free himself from control having been defeated, several of his counselors were put to death, which step, on the part of the victorious party, was approved of by parliament, by whom further executions were ordered among the king's adherents; and the sentences were carried into effect. In 1389, however, Richard, by a sudden movement, succeeded in throwing off the yoke. Gloucester was obliged to retire; but from indolence and want of capacity, the king soon allowed the reins of government to slip from his own hands into those of the duke of York, and Lancaster's son, Henry of Bolingbroke. In 1394 the queen died, and soon after a marriage treaty was concluded between Richard and Isabella, infant daughter of Charles VI. of France. Gloucester reprobating this marriage, which seems to have been unpopular, Richard caused him to be privately arrested and conveyed to Calais, where he died, or was murdered, as has been conjectured. On the meeting of parliament, the king had his own way; the earl of Warwick was banished, and the earl of Arundel beheld. Having triumphed over his foes, Richard now began to quarrel with his friends. A misunderstanding having taken place between Bolingbroke and Mowbray, duke of Norfolk, the king, desirous to be rid of both, sent the former into banishment for ten years, and

the latter for life. But Bolingbroke had been assiduously cultivating the popularity which his cousin had been as assiduously throwing away; and the result became apparent in 1399. On his return, in that year, from a military expedition in Ireland, Richard found that Bolingbroke had, in his absence, landed in England; that he had soon found himself at the head of a formidable army, and that the duke of York had yielded and gone over to his side. The army which the king had had with him in Ireland, also, no sooner landed than it almost entirely passed over to the invader. Richard found himself without force or friend, while Bolingbroke, now styling himself duke of Lancaster, was at the head of 80,000 men. Meeting the conqueror at Flint castle, Richard was carried captive in his train to London. On Sept. 29, 1399, he formally resigned his crown. On the following day the resignation was ratified by parliament, and the crown conferred on Lancaster. By order of the peers, Richard was confined secretly in a castle, but where is not known. In the February following his resignation, the nation was told that he was dead, and his body, or what was supposed to be it, was brought with much pomp from Pentefract castle, and shown to the people. There were rumors at the time of his having been murdered, and long afterward of his being alive and in Scotland. But nothing really authentic is known regarding the end of Richard II.

RICHARD III., King of England, was the youngest son of Richard duke of York and the great-grandson of Edmund duke of York, the fifth son of Edward III. Richard was born at Fotheringay castle on Oct. 2, 1452. On the defeat and death of their father in 1460, he and his brother George, afterward duke of Clarence, were sent by their mother to Utrecht, where they remained for a short while under the protection of the duke of Burgundy, until the crown was won by their eldest brother, Edward IV. In 1470 Richard along with Edward remained in Flanders, whither they had fled on the success achieved for Margaret of Anjou by the earl of Warwick. In 1471 he led the van of his brother's army at Barnet; he also rendered efficient assistance at the crowning victory of Tewkesbury. It is said that he and Clarence murdered prince Edward, son of Henry VI., after the battle. It has also been popularly believed that he murdered Henry himself in the Tower. Now duke of Gloucester, in 1472 he married lady Anne Neville, daughter of Warwick and widow of prince Edward. He has been generally accused of complicity in the judicial murder of his brother Clarence in 1478, and Shakespeare has placed the charge almost beyond the power of historical criticism to efface. The evidence, however, seems to be almost null. In 1483, on returning from an expedition into Scotland, he heard of the death of his brother the king. He met the duke of Buckingham at Northampton, where it is believed that those measures were concerted which resulted in the execution of Hastings and others, the confinement in the Tower of the infant children of the late king, and the placing of the English crown on the head of Richard III. His reign dates from June 26, 1483. He was crowned at Westminster on July 6 following. For some time he seems to have been really popular. He was well received on a tour which he made in the northern counties. On reaching York, however, on his return, he heard of a formidable insurrection which had broken out in the south in favor of his nephew Edward V. But the bold and remorseless nature of Richard was on this occasion triumphant. It was soon known over the land that the royal children were dead. Little doubt has ever been held that they were murdered, or that the deed was done at the instigation of their uncle. The insurrection was quelled, and Buckingham, who had been at the head of it, found guilty of treason and executed. The parliament, which met on Jan. 23, 1484, declared the issue of the late king to be bastard, and the property of the late rebels confiscated. Richard now offered to marry the princess Elizabeth, daughter of Edward IV., to his eldest son, Edward, on whose premature death he offered to marry the princess himself, his own queen being still alive. On the death of Anne, however, supposed to have been murdered by poison, on March 16, 1485, Richard's counselors dissuaded him from marrying Elizabeth, on the ground of the popular indignation which the step was sure to excite. Meanwhile the crimes which his ambition had already led him to commit had excited the deepest disgust both among nobility and people. One by one his adherents were dropping off and crossing to France to join the earl of Richmond. At last the storm burst. On Aug. 7, 1485, Richmond landed at Milford Haven. On the 21st of the same month was fought the decisive battle of Bosworth. It deprived Richard both of his crown and life, and decided the long war of the Red Rose and the White in favor of the house of Lancaster. Richard was doubtless a man of great energy and ability, but in his aims selfish and unprincipled. It must, however, be kept in view that his age was one in which human life was held of little value, and deception regarded almost as an accomplishment. See Life by J. H. Jesse (London, 1862).

RICHARD OF CIRENCESTER—in Latin, *Ricardus Corinensis*—a well-known early English chronicler, was born at Cirencester in Gloucestershire, in the first half of the 14th c., but nothing whatever is known of his family or circumstances. In 1350 he entered the Benedictine monastery of St. Peter, Westminster—whence he is sometimes called the "monk of Westminster"—and remained there for the rest of his life. His leisure was devoted to the study of British and Anglo-Saxon history and antiquities. In the prosecution of his investigations Richard is said to have visited numerous libraries and ecclesiastical establishments in England, and we know for certain that in 1391 he

obtained a license from his abbot to visit Rome. He died in 1401 or 1402. Richard's principal works are *Historia ab Hengista ad Ann. 1348*, in two parts, of which the first (preserved in the public library of Cambridge) treats of the affairs of England from the Saxon invasion to the death of Harôld; two theological productions (in the Peterborough library), a *Liber de Officiis Ecclesiasticis* and a *Tractatus super Symbolum Majus et Minus*; and above all his *De Situ Britannia*, a treatise on the ancient state of Great Britain. This work—of which, however, it must be admitted that the authenticity is doubtful—was, curious to say, first brought to light by Dr. Charles Julius Bertram, professor of English at Copenhagen, in 1747, who professed to have discovered it in the royal library there, and who sent a transcript of it, together with a "fac-simile" of the original, to the celebrated English antiquary, Dr. Stukeley. This gentleman published an analysis of it in 1757, and in the same year prof. Bertram published the whole treatise, along with the "remains" of Gildas and Nennius, under the title *Britannicarum Gentium Historiæ Antiquæ, Scriptores tres, Ricardus Corinensis, Gildas Badonicus, Nennius Banchorensis*. A new edition with an English translation and a "fac-simile," a biography of the supposed author, appeared at London in 1849, and a reprint forms one of the "Six Old English Chronicles" in Bohn's "Antiquarian Library" (1848). If we could feel quite sure that the work was genuine, it would be of the highest importance for the study of British and Roman-British antiquities, but unfortunately Bertram's "original" (like the "original" of Macpherson's *Ossian* and Joe Smith's *Book of Mormon*) is not to be found, nor does it appear that anybody ever saw it but himself, so that Gibbon's praise, "that he [Richard] shows a genuine knowledge of antiquity very extraordinary for a monk of the 14th century," must be regarded with suspicion.

RICHARD PLANTAGENET, second son of John king of England, was born Jan. 5, 1208. In 1226 he was created earl of Cornwall by his brother Henry III. In 1232 he put himself at the head of the party opposed to Hubert de Burgh, whose influence was at that time supreme in the councils of the king. Immense wealth, a calm, practical temperament, and a shrewd eye for his own worldly interest were the elements which combined to make Richard Plantagenet a considerable power in the state. His influence prevailed, and De Burgh was driven from his position with loss both of honors and estate. In 1256 Richard Plantagenet was elected titular king of the Romans; and though his election was disputed, he was crowned at Aix-la-Chapelle. Subsequently he exercised some of the nominal rights which belonged to his sovereignty. In the great struggle which took place between Henry III. and his nobles, Richard Plantagenet at first acted the part of a mediator; subsequently, however, he took a decided part with his brother against the party which was headed by Simon de Montfort; and on May 14, 1264, he was taken prisoner by that leader at the battle of Lewes. De Montfort shut him up in Kenilworth castle, from which he was released at the end of a year. The rest of his life does not seem to have been marked by any event of historical importance. He was thrice married: in 1230 to Isabel, daughter of the earl of Pembroke; in 1243 to Sanchia of Provence, sister of queen Eleanor; and in 1267 to Beatrice, daughter of Theodorik de Falkmonte. He died on April 2, 1272. His character seems to have been unmarked either by great virtues or great vices.

RICHARDS, JAMES, 1784-1823; b. Mass.: graduated at Williams college 1809; at Andover theological seminary 1812. In the summer of 1807 he, with Gordon Hale and Samuel J. Mills, were accustomed to withdraw to an unfrequented meadow at some distance from Williams college, and beside a haystack to confer and pray together concerning missions to the heathens. The spot afterward became historical, and is now marked by a neat park and a memorial stone. Mr. Richards was one of the six original signers of the memorial on missions presented to the general association of Massachusetts which led to the formation of the American board. His name and that of Mr. Rice were afterward withdrawn "lest the association should be alarmed at the probable expense of supporting six missionaries." In 1815 he sailed as a missionary of the A. B. C. F. M. for Ceylon. In 1823, having long been out of health, he took a voyage to the cape of Good Hope, where he died.

RICHARDS, WILLIAM, 1792-1847; b. Mass.: graduated at Williams college 1819, and Andover theological seminary in 1822; embarked the same year as missionary to the Sandwich islands accompanied by four natives educated in this country. In 1837 visited the United States, in 1838 became counselor, interpreter, and chaplain to the king; and in 1842, after the organization of an independent government on the islands, was sent as ambassador to England. In 1845 he was appointed minister of public instruction. His influence over the king and government was very great.

RICHARDSON, a co. in s.e. Nebraska, adjoining Kansas; bounded on the e. by the Missouri river, drained also by the Big Nemaha river and its south fork, and by the Muddy creek; on the Atchinson and Nebraska railroad; about 550 sq.m.; pop. '80, 15,028-13,030 of American birth. The surface is rolling prairies or woodland. The soil is fertile. The principal productions are wheat, corn, oats, and live stock. Co. seat, Falls City.

RICHARDSON, BENJAMIN WARD; b. England, 1828; educated at Anderson's university, Glasgow. In 1856 he became a member of the Royal college of physicians,

and a fellow of the Royal society in 1867. Among his scientific discoveries were those of a special poisonous product called *sepline*, and the application of ether spray for the local abolition of pain in surgical operations. Dr. Richardson has published many medical and scientific treatises, covering a wide range of topics. He was for some years the editor of the *Journal of Public Health*, and later of the *Social Science Review*. He is officer, fellow, or member of many societies in Europe and America.

RICHARDSON, CHARLES, LL.D., 1775-1863; b. England; published in 1815 *Illustrations of English Philology*. He began the lexicographical part of the *Encyclopædia Metropolitana*, but the work was suspended. The separate publication of his *Dictionary* was begun in 1835 and completed in 1837. It is a work of great value. In 1854 he published a book *On the Study of Languages*.

RICHARDSON, CHARLES FRANCIS, b. Maine; graduated at Dartmouth college 1871; became literary editor of the *New York Independent* in 1872, associate editor of the Philadelphia *Sunday School Times* in 1877, and in 1880 was made editor of a new literary journal *Good Literature*, which has a large circulation. He was one of the two editors of *The College Book*; and among other contributions to American periodicals wrote an article on Cambridge, Mass., for *Harper's Monthly* in 1876. He is the author of *A Primer of American Literature*, and *The Choice of Books*—in which are shown extensive knowledge of books and excellent literary judgment.

RICHARDSON, ISRAEL B., 1819-62; b. Burlington, Vt., descendant of gen. Israel Putnam, graduate of West Point 1841. He served in the Florida war, was brev. maj. for gallantry in the Mexican war; left the army in 1855, and settled in Michigan. In the war of the rebellion he went out as col. 2d Michigan volunteers, commanding a brigade at Blackburn's Ford and Bull Run, and a division in the peninsula campaign under gen. Sumner. He rendered important service at Manassas and South Mountain, and died from the effects of a wound at Antietam.

RICHARDSON, JAMES, 1809-51; b. Boston, England, traveled extensively in Africa as correspondent of a London newspaper, and published an account in 2 vols. with the title *Travels in the Great Desert of Sahara*. This book gained him the appointment of leader in a new expedition into central Africa in 1850, joined by Barth and Overweg. He successfully performed the journey from Tripoli to the desert of Hamnah and Bornoo, but death stayed his progress at Ungurutua. In 1853 the notes made on this journey were published, edited by Bayle St. John, with the title of *A Narrative of a Mission to Central Africa*.

RICHARDSON, SIR JOHN, K.C.B., M.D., LL.D., etc., a celebrated traveler and naturalist, was b. Nov. 5, 1787, at Dumfries, of which town his father, Gabriel Richardson, esq., was several years provost. In his 14th year he left the academy of Dumfries to study at the university of Edinburgh, with a view to the medical profession. After obtaining his diploma, Richardson entered the royal navy, and in 1807 was appointed assistant-surgeon on the *Nymphæ* frigate, in which he was present at the battle of Copenhagen. Some time later, the *Nymphæ* was engaged in the blockade of the Tagus, when, after twice volunteering to go in the boats on cutting-out expeditions, Richardson was transferred to the flag-ship. After the convention of Cintra the ships left the Tagus, and Richardson was nominated to the *Blossom* sloop-of-war, in which he served on the coast of Africa, lord Exmouth removing him to the *Bombay*, 74, in 1810. His next services were in the *Cruiser*, on the Baltic and North sea stations; afterward surgeon of the 1st battalion of royal marines, stationed in Canada, and later doing service in Georgia, Richardson having charge of the hospital-ship for the sick and wounded of the brigade. His next appointment, 1819, was that of surgeon and naturalist to the overland expedition under Franklin. In 1822 Richardson returned to England, and early in 1824 became surgeon to the royal marines at Chatham. In 1825-'27 he accompanied Franklin in his overland expedition to the mouth of the Mackenzie, and by orders of the admiralty was detached to survey the coast between that river and the Coppermine, executing the task with singular success and ability. On returning from this expedition Richardson resumed his duties at Chatham, remaining there till his promotion, 1838, to be physician of Haslar hospital, and inspector of naval hospitals and fleets. In 1846 Richardson received the honor of knighthood; and two years later, moved by genuine friendship and unsurpassed self-devotion, set out to search for and if possible save his former traveling companion, sir John Franklin, of whom nothing had been heard for upward of two years. On March 25, 1848, Richardson, accompanied by Mr. Rae, departed from Liverpool to look for the missing expedition between the Mackenzie and Coppermine rivers. Landing at New York, Richardson hastened by way of Montreal and the Canadian lakes to the head-waters of the Mackenzie, which he descended, and then turned eastward by capes Bathurst and Parry. Contrary to former experience, the sea toward cape Krusenstern was found closely packed with dangerous drift-ice. After immense labor the party reached cape Hearne, where it was found necessary to abandon the boats, and after 12 days' fatiguing march, through half-frozen swamps and over hills covered with snow, succeeded in gaining fort Confidence, at the north point of Great Bear lake. Here Richardson spent the winter in scientific observations, returning to England in 1849, and resuming his duties at Haslar. In 1855 Richardson tendered his

resignation, after 48 years of almost unexampled activity in the public service. Moved in all his actions by a high sense of honor and sincere piety, possessed of the most unselfish nature, and a mind so acute as almost intuitively to form correct judgments, united with the humble and loving disposition of a child, Richardson, during his long career, was one of the most lovable as well as useful men of the present century. Up till his death, June 5, 1865, he possessed much of the elasticity of youth; and whenever a scientific society assembled, he was found leaving for a time his quiet home by the lake of Grasmere to take part in the deliberations.

Richardson was a fellow of the Royal societies of London and Edinburgh, of the royal geographical society, member of the geographical society of Paris, and of many other literary and scientific bodies in Great Britain, the continent of Europe, and America. He contributed largely to the account of Franklin's first expedition (Lond. 1823); and to that of the second expedition (Lond. 1828). In 1836 appeared *Fauna Boreali-Americana, The Fish; A Boat Voyage through Rupert's Land and the Arctic Sea* (Lond. 1851); *The Polar Regions* (1861). Besides zoological appendices to the voyages of Parry, Ross, Back, etc., his contributions to the journals and transactions of various societies have been very numerous. A recent work is the *Museum of Natural History*, in conjunction with several other distinguished naturalists.

RICHARDSON, RICHARD, 1704-81; b. Va.; became a land surveyor, and commanded a regiment in the Indian wars. In 1775 he was a member of the Charleston council of safety. He was a member of the legislative council of South Carolina 1776, and assisted in forming the state constitution. He resisted lord Cornwallis's efforts to gain him over, was made prisoner at the capture of Charleston, and died from the effects of the privations of his prison life.

RICHARDSON, SAMUEL, the first great English novelist, was b. in Derby in the year 1689. His father, though originally connected with a higher grade of society, was a joiner. It was his ambition to educate his son for the church; but for this the means were found deficient, and at the age of 17, with simply such an education as a country school could then furnish, the young man fared forth to London, where he became apprentice to one John Wilde, a printer. In the discharge of his business duties he was exact and careful, and on the expiration of his apprenticeship he became foreman of Mr. Wilde's establishment. Some years afterward he started as printer on his own account in Salisbury court, Fleet street; and on finding his success assured he wedded Miss Allington Wilde, the daughter of his late employer. After her death in 1731 he was again married to a Miss Leake. By each lady he was blessed with six children, of whom only four daughters along with their mother survived him. Throughout life, in his business relations, he was prosperous; very early he had influence to secure the lucrative post of printer of the journals of the house of commons; in 1754 he became master of the stationer's company; and in 1760 he purchased the moiety of the patent of king's printer; but died on July 4 of the year following.

Richardson's genius flowered late. Till he had turned 50 his relations with literature, except in the way of printing it, were of the most slight and amateur kind; but in 1740 he surprised the world with his *Pamela*, which had instant and great success. Its continuation, to which the author was stung by the attempt of some hungry scribe to make a meal or two by the issue of a pretended sequel, entitled *Pamela in High Life*, was, however, pronounced much inferior. Memorable in itself, the work is now to most readers more so as having suggested to Fielding his *Joseph Andrews*, originally conceived as a parody of Richardson's somewhat prudish moralities. The exquisiteness of the satire was not appreciated by Richardson; and he never forgave Fielding for it, or could speak of him after with common temper or patience.

In 1748 he issued the first four volumes of *The History of Clarissa Harlowe*—by common consent his masterpiece—a work which in its progress to completion excited the most intense interest. His third and last great work, *The History of Sir Charles Grandison*, was published in 1753. As a whole, this is less interesting than its predecessors; and in his representation of the life of the fashionable classes, of which he had no clear personal knowledge, the writer succeeds but indifferently.

Richardson's method of minute elaboration has in itself some tendency toward an effect of tedium; moreover, the epistolary vehicle which he has chosen, though with certain advantages of its own, does not subserve rapidity of movement; and as his stories run to immense length, their perusal involves some effort of patience. But in the depth and simplicity of his sentiment, his profound knowledge of the heart, and mastery of elemental emotion, there are singular sources of attraction; and in virtue of the overwhelming effects of pathos in which the interest of his *Clarissa* culminates, a place must always be assigned him among the very few potent masters of genuine tragic passion. His specialty lies in subtle analysis of the intricacies of female mind and emotion; and in this particular field he has scarcely perhaps been surpassed. A curious sort of passionless confidential intimacy with women, it seems from his earliest years to have been his instinct to cultivate; throughout life he was the center of a circle of female friends and admirers, who came to him with their little delicate secrets, as to a kind of lay father-confessor; and of the fruits of his nice observation of them he has given us to the full in his novels. The success of these is said to have bred in him a

somewhat inordinate vanity, the only little flaw in a character unusually blameless and amiable. Of works of less importance he published, besides occasional contributions to periodicals, *The Negotiations of Sir Thomas Roe in his Embassy to the Ottoman Porte from 1621 to 1628* (1740, fol.); *An Edition of Esop's Fables, with Reflections; Familiar Letters to and from several Persons on Business and other Subjects*; and in 1804 there appeared his *Correspondence Selected and Published, with a Biography by Anna Letitia Barbauld*.

RICHELIEU, a co. in s. Quebec, having the St. Lawrence river for its n. and n.w. boundary, and the Yamaska river on the e. and s.e.; intersected in the w. by the Richelieu river; 190 sq.m.; pop. '71, 20,048. Its surface is uneven, a large proportion covered with forests. Its soil is clayey and productive along the river bottoms. Ship-building is an important branch of industry, and engines, mill machinery, stoves, plows, leather, bricks, etc., are manufactured. Co. seat, Sorel.

RICHERAND, ANTHÉLME, Baron, 1779-1840, b. France; graduated at the Paris school of medicine; in 1807 became professor of surgical pathology in the faculty of medicine. During the occupation of Paris by the allies his care of the sick gave him a high reputation; and he was made a baron by the French government. His chief work is his *Nouveaux Eléments de Physiologie*, 1801.

RICHELIEU, ARMAND JEAN DU PLESSIS, Cardinal, Duc de, was b. of a noble but impoverished family at Paris, Sept. 5, 1585, and was educated for the military profession at the college de Navarre. On the retirement to a religious life, however, of his elder brother, who held the bishopric of Luçon, Richelieu, with a view to succeeding to this preferment, betook himself to ecclesiastical studies, and underwent the preliminary examination for his degree at the Sorbonne. In 1607 he was consecrated bishop of Luçon at Rome by cardinal de Givry, in presence of pope Paul V., and for some time devoted himself zealously to the discharge of his duties in his diocese. At the states-general in 1614, being appointed one of the representatives of the clergy, he attracted the notice of the queen-mother by an address which he delivered in the presence of the young king, Louis XIII.; and by his appointment in 1616 as secretary at war and foreign affairs, the way seemed opened to his success in political life; but in one of the vicissitudes of state intrigue common at that period, he soon found it necessary to withdraw from court, and return to his diocese. Meanwhile a rupture occurred between the queen-mother and the king, and Richelieu, through the agency of a very remarkable man—the celebrated Capuchin father Joseph—whose fortunes thenceforward were inseparably united with those of Richelieu, succeeded in effecting their reconciliation (Aug. 1620), and the restoration of the queen to her position at court. The foundation of Richelieu's influence in consequence was solidly laid; but he appears to have acted with much tact and patient forbearance. He formed an alliance with the powerful favorite, the duc de Luynes, and 1622 was named cardinal, and two years later, 1624, he was made minister of state—a position which, although frequently menaced, and constantly beset by every variety of court intrigue, he retained to the end of his life. His first important measure was the conclusion of the alliance with England, by the marriage of Henrietta, sister of the king, with Charles, then prince of Wales, in 1624. His successful conduct of the war of the Valteline, an affair of much delicacy for a cardinal, as presenting the pope himself as the antagonist of France, tended still more to strengthen his power. His enemies, however, were constantly on the watch for opportunities of undermining his influence, and even of bringing about his death. The queen withdrew her favor, and the king, while he trusted him implicitly, never ceased to fear him. The crisis of the struggle took place Dec. 11, 1630, when Richelieu himself believed that his fate was inevitable. His disgrace, indeed, had been decided; the king fearing to meet him face to face, had refused him an audience. His attempts to force an entrance to the king at the Luxembourg were defeated; but Louis, in his weak fear of Richelieu having withdrawn to Versailles, the cardinal there succeeded in obtaining an audience, and having once effectually overborne the weakness and alarmed the fear of the sovereign, his supremacy remained from that day firmly and irrevocably established. This famous day is known as *Le Journée des Dupes*.

The administration of Richelieu forms an epoch in the history of the constitution of the kingdom of France, as well as of her relations with other countries. It is memorable for several great measures, or series of measures, through which the posture of affairs underwent a complete and permanent change. Of these, the first and the most lasting in its results was that by which the absolute authority of the sovereign was established. From the mediæval period the power of the French kings had been controlled and, in many cases overridden by the feudal privileges of the nobles; and in the stormy conflicts of the 16th and of the beginning of the 17th centuries, the power of the crown had often been reduced to a cipher. By a succession of vigorous and energetic and, it must be added, not unfrequently unscrupulous measures, Richelieu succeeded in breaking down the political power, and subduing the arrogant assumptions of the great families; the heads of several among which were brought to the scaffold, while not a few were condemned to life-long imprisonment. Among his most inveterate and most powerful adversaries was Gaston, duke of Orleans, brother of the king; but Richelieu triumphed over him, and even the queen-mother, Maria de Medicis, was obliged to bow before the unbending spirit of Richelieu, and to withdraw into exile

at Cologne; and Richelieu, at the close of his career, delivered up the royal authority, which he had wielded for 18 years, almost without a single constitutional check upon its absolute exercise.

Another of the great enterprises of this minister was the overthrow of the Huguenot party as a political power, and a rival of the throne in France. The siege and capture of Rochelle, which he conducted in person (1628), was followed by the submission of the other Huguenot strongholds. Richelieu, however, secured for the Huguenot body a certain measure of religious toleration; and, on the whole, is confessed to have used his success in this conflict with moderation.

In the external relations of France, the great object of all his measures was the overthrow of the preponderance of Austria. With this view he did not hesitate to foment the internal disaffections of Germany, even allying himself with this design with the German Protestants, and even with the great champion of the Protestant cause, Gustavus of Sweden; and in connection with his anti-Austrian policy, he also took part with the disaffected Spanish provinces in the Netherlands. His designs on Belgium, however, failed of success. With similar views he lent his support to the revolt of Catalonia against Philip IV., and sent an army into Piedmont; nor is there any part of his foreign policy to which he adhered with such pertinacity to the very end of his life.

His internal administration of France has been severely criticised. He was reckless and unscrupulous in the use of means against his enemies, and the expenditure which his foreign wars entailed led to many and oppressive impositions. His own personal expenditure was magnificent even to prodigality, but he is acquitted of all sordid schemes of self-aggrandizement.

Richelieu died at Paris, Dec. 4, 1642. Notwithstanding his many distracting occupations, the writings which he left behind fill several volumes. Some of these, ascetical or controversial, were written before his entrance into political life. Of his later writings, his *Testament Politique* and his *Memoirs* have attracted much notice. He even indulged occasionally in literature, and wrote two plays of indifferent reputation. His letters are numerous, and many of them full of interest. He was a liberal patron of literature, and to him France owes the establishment of the royal printing presses and the foundation of the French academy.

RICHLAND, a co. in s.e. Illinois, drained by the Little Wabash river and Fox and Bonpas creeks, traversed by the Ohio and Mississippi and the Grayville and Mattoon railroads; about 350 sq.m.; pop. '80, 15,546—14,644 of American birth. The surface is rolling and heavily timbered. The soil is fertile. The principal productions are corn, oats, and wheat. Co. seat, Olney.

RICHLAND, a parish in n.e. Louisiana, drained by Bœuf bayou and Big creek; intersected by the North Louisiana and Texas railroad; 340 sq.m.; pop. '80, 8,440—8,360 of American birth, 5,236 colored. Cotton, corn, and pork are the staples. Chief town, Rayville.

RICHLAND, a co. in n. central Ohio, drained by the Black and Clear forks of the Mohican river; intersected by the Pittsburg, Fort Wayne and Chicago, the Atlantic and Great Western, and the Sandusky railroads; 500 sq.m.; pop. '80, 56,306—33,749 of American birth. The soil is unusually fertile; wheat, corn, oats, hay, butter, maple sugar, and cattle are the staples. Co. seat, Mansfield.

RICHLAND, a co. in central South Carolina, drained by the Wateree and Congaree rivers, which unite to form the Santee, and by the Broad; intersected by the Charlotte, Columbia and Augusta and other railroads; 470 sq.m.; pop. '80, 25,585—14,737 of American birth, 19,396 colored. The surface is slightly hilly; cotton, corn, and pork are the chief products. Co. seat, Columbia, the capital of the state.

RICHLAND, a co. in s.w. Wisconsin, drained by the Wisconsin river and Eagle and Pine creeks; on the Pine River Valley and Stevens's Point railroad; about 600 sq.m.; pop. '80, 18,174—16,293 of American birth. The surface is rolling and heavily timbered. The soil is fertile. The principal productions are corn, wheat, oats, hops, and live stock. Co. seat, Richland Center.

RICHMOND, a co. in e. central Georgia, bordering on South Carolina; drained by the Savannah river, its n.e. boundary, and several creeks; intersected by the Central and the Georgia railroads; 330 sq.m.; pop. '80, 34,569—33,111 of American birth, 17,483 colored. The surface is broken and hilly; corn, cotton, and pork are the staples. Granite is found. Co. seat, Augusta.

RICHMOND, a co. in New York, consisting of Staten Island, in New York bay, divided from New Jersey by Staten Island sound and Kill van Kull bay; from Long Island by the Narrows; about 55 sq.m.; pop. '80, 38,994—28,032 of American birth. Staten Island is about 14 m. long. The surface is hilly, and contains iron. The scenery is beautiful. There are many fine residences and villas of New York business men. The soil is fertile. The principal productions are corn and hay. Co. seat, Richmond.

RICHMOND, a co. in s. North Carolina, adjoining South Carolina; between the Lumber river on the e. and the Pedee on the w.; traversed by the Carolina Central railroad; about 775 sq.m.; pop. '70, 12,882—6,598 colored. The surface is rolling and

heavily timbered. The soil is fairly fertile. The principal productions are cotton, corn, turpentine, and tar. Co. seat, Rockingham.

RICHMOND, a co. in Nova Scotia, including the s. part of Cape Breton island, also Arichat and two or three other small islands; intersected by St. Peter's canal; 629 sq. m.; pop. '71, 14,628. Fishing is the chief occupation of the inhabitants. Co. seat, Arichat.

RICHMOND, a co. in e. Virginia, drained by the Rappahannock river; about 175 sq. m.; pop. '80, 7,198—3,434 colored. The surface is level and heavily timbered. The soil is fertile in parts. The principal productions are corn and wheat. Oyster fishing is largely pursued. Co. seat, Warsaw.

RICHMOND, a co. in s. Quebec, drained by the St. Francis and other rivers, and intersected by the Grand Trunk railroad; 556 sq. m.; pop. '71, 11,213. Wheat, oats, hay, and cattle are the staples. Water-power is abundant and there are many manufactured articles. Copper ore and building stone are found. Co. seat, Richmond.

RICHMOND, a market t. and parliamentary and municipal borough in the North Riding of Yorkshire, on the left bank of the Swale, 42 m. n.w. of York. The parish church is chiefly in Gothic, but partly in Norman architecture; the grammar-school has an endowment of £270 a year, and attached to it are six scholarships. Though the trade of Richmond is now much less extensive than in earlier ages, iron and brass founding and tanning are carried on, and there are a paper and several corn mills. The borough returns one member to the house of commons. Pop. of municipal borough in '71, 4,443.

The earldom of Richmond was conferred by the Conqueror upon his kinsman, Alan Rufus, count of Bretagne; but came into the possession of the crown when Henry, earl of Richmond, succeeded Richard III. as Henry VII. The title of duke of Richmond was afterward conferred by Charles II. upon his son Charles Lennox, in whose family it still remains. The castle, surrounded by picturesque scenery, stands on a rock overlooking the river. In the vicinity are some ruins of a small monastery, founded in 1258.

RICHMOND, a rising t. of Surrey, 10 m. w.s.w. of London by railway, stands partly on the summit and declivity of Richmond hill, and partly on the level right bank of the Thames. The rich and beautiful scenery of the vicinity is seen with advantage from the terrace, which stretches along the brow of the hill. The parish church contains the tombs of Thomson the poet, and of Edmund Kean the tragedian. The banks of the Thames are studded with villas, and around the town are numerous nurseries and kitchen gardens. Pop. '71, 15,113, who derive their subsistence chiefly by providing for the wants of the immense number of visitors and pleasure-seekers who frequent the town, especially during summer.

Richmond, which was formerly called Scheen or Sheen, received its present name from Henry VII., who named it after his own earldom. It was a royal residence in the time of Henry I., and since that time the sovereigns of England have frequently resided here, and here Edward III., Henry VII., and Elizabeth died. Richmond park, 8 m. in circuit, is open to the public.

RICHMOND, a city of Indiana, on the e. fork of Whitewater river, 70 m. n.w. of Cincinnati, and the focus of several railways. It was founded by a colony of Friends in 1816. The river gives water-power to factories of cotton, wool, flour, and several extensive implement factories. Richmond has a brisk trade with a fertile and populous country. There are 20 churches and 8 newspapers. Pop. '60, 6,603; '70, 9,445; '75, 11,579.

RICHMOND (*ante*), a city in e. Indiana, 68 m. e. of Indianapolis, 92 m. s.e. of Fort Wayne, and 41 m. w. of Dayton, Ohio; pop. '80, 12,743. It is the co. seat of Wayne co., on the Cincinnati, Richmond and Chicago railroad, the Columbus, Chicago and Indiana Central, and the Cincinnati, Richmond and Fort Wayne. It has good educational advantages, a public library of 10,000 vols., with a scientific association, and a museum, 2 theaters, several public halls, and street railways. There are 3 national banks with an aggregate capital of \$1,000,000, a steam fire-department, and excellent drainage. It has a Friends academy, and is the seat of Earlham college, with a preparatory department and a library of 3,500 vols., organized 1859; open to both sexes, and under the direction of the society of Friends. It is the place of yearly meeting for the Friends in Indiana. It is also the seat of 2 Lutheran and 2 Roman Catholic schools, and a business college. In the n.e. section are the county fair grounds, 33 acres in extent. The slaughtering of hogs is an important industry. It has 43 benevolent associations; 2 charitable organizations, conducted solely by ladies; also an orphans' home, and a home for friendless women.

RICHMOND, the capital of Virginia, on the left bank of the James river, at the head of tide-water, 150 m. from its mouth; lat. 37° 32' 17" n., long. 77° 27' 28" w.; 100 m. s. of Washington, picturesquely situated on the Richmond and Shockoe hills, on the lower falls of the James river, and regularly laid out and built, and surrounded with beautiful scenery. The capitol is a stately building in the center of a park of 8 acres, the grounds of which are ornamented with trees and statuary. There are also handsome state and county edifices, penitentiary, theater, orphan asylum, 50 churches, 3 colleges, 7 daily and 14 other newspapers, several cotton and tobacco factories, extensive flouring-mills,

forges, furnaces, and machine-shops. Tobacco and flour are the principal articles of export from Richmond. Vessels drawing 10 ft. can come within a mile of the center of the city; those of 15 ft. to 3 m. below. A canal round the falls gives a river navigation 200 m. farther, and a canal and several railways connect it with the great network of southern railways. Richmond was founded in 1742. In 1811 the burning of a theater destroyed the lives of 70 persons, including the governor of the state. In June, 1861, it was selected as the confederate capital, and from that period was the objective point of a series of formidable military expeditions for its capture, under generals McDowell, McClellan, Burnside, Hooker, Meade, and Grant, and defended by gen. Lee with a large army and formidable lines of fortifications, until the seizure of the lines of supply by generals Grant and Sheridan compelled its evacuation after a series of sanguinary battles, April 3, 1865. A considerable portion of the city was destroyed by the retreating confederates. Pop. '60, 37,910; '70, 51,038.

RICHMOND (*ante*), became the capital of the state of Virginia in 1779, though then only a small village. Here the convention to ratify the federal constitution met in 1788, and it has been the scene of many other important political gatherings, national party conventions, etc. April 17, 1861, the state of Virginia seceded from the union; and July 20, Richmond was the scene of an adjourned meeting of the confederate congress, being appointed the capital of the confederacy, a position which it held during the rebellion. At this time the confederate forces in Virginia numbered 60,000 men, under the command of gen. Joseph E. Johnston, and thenceforward until the close of the war, Richmond continued to be a chief point of attack by the federal forces. The destruction in the city during the evacuation of April 3, 1865, was chiefly in the business section, and included as many as 1000 buildings; which, with that of other property, involved a loss estimated at \$8,000,000. Immediately after the cessation of hostilities, re-building was begun, and proceeded with great rapidity. Five bridges across the James river connect Richmond with Spring hill and Manchester, the latter town containing two fine cotton-mills. Within a few hours' ride of the city are several battle-fields and national cemeteries. The Tredegar iron-works covering 15 acres, were employed for the manufacture of cannon during the existence of the confederacy, and are now among the most important iron-works in the country. The Gallego and Haxall flour-mills are among the largest in the world. Hollywood cemetery, in the w. part of the city is an interesting spot, as well for its historic memories and personal associations, as for its natural and artificial beauties. An interesting monument is that which marks the grave of president James Monroe. Here also lies gen. J. E. B. Stuart, who commanded Lee's cavalry during the rebellion; while hundreds of confederate dead rest within the portion of the cemetery appointed for the soldiers. Monroe and Marshall parks are respectively at the e. and w. ends of the city. Libby prison and Castle Thunder, used during the war as military prisons, are now tobacco warehouses. The state capitol is built in the Græco-composite style of architecture, with a portico of Ionic columns: the plan was drawn after that of the *Maison carrée* at Nismes, in France, and was supplied by Thomas Jefferson. In the center of the building a square hall is surmounted by a dome, beneath which is Houdon's statue of Washington, of marble, life-size, representing him in his general's uniform. On the esplanade, near the capitol square, is Crawford's famous equestrian statue of Washington, claimed to be one of the finest bronzes in the world. Horse and rider are of colossal size, the animal half thrown back upon its haunches; the statue rises from a massive granite pedestal, and is surrounded by bronze figures of Patrick Henry, Thomas Jefferson, John Marshall, and other eminent Virginians. St. John's Episcopal church is famous as the place of meeting of the Virginia convention of 1775, which decided the attitude of the colony, and in which Patrick Henry made his celebrated speech, ending—"I know not what course others may take; but as for me, give me liberty or give me death!" This church was also, in 1788, the place of meeting of the convention which ratified the federal constitution. The "Monumental" church was built on the site of the Richmond theater, destroyed by fire in 1811. Five lines of railroad intersect at Richmond, and there are regular lines of steamers connecting the city with Norfolk, Baltimore, Philadelphia, and New York. The population of Richmond in 1880, was 63,803. The manufactures included iron-works, cigar factories, coach and wagon factories, sugar-refineries, foundries, machine-shops, furniture, sheetings and shirtings, stoneware, etc. The city is generally well laid out, and well built, the streets are lighted with gas; in the business quarter are solid and handsome structures, and the private residences are usually built in the midst of gardens and lawns. The river view is fine at many points, particularly on Libby hill (Marshall park). In the state library are about 40,000 volumes, and this institution contains many valuable and interesting historical portraits. The custom-house and post-office are combined in a fine granite structure. The medical college is a characteristic specimen of Egyptian architecture. Near this building is the Brockenbrough house, now used as a school, but during the war occupied by Jefferson Davis in his official capacity as president of the confederacy.

RICHMOND, CHARLES HENRY GORDON LENNOX, Duke of, b. Whitehall, England, 1818; eldest son of the 5th duke of Richmond; graduate of Christ-church, Oxford, 1839, capt. in the army 1844, M.P. for West Sussex 1841-60, representing the conservative

interest. He performed the duties of aid-de-camp to the duke of Wellington, and viscount Hardinge; has been president of the poor law board, and privy councillor. In 1860 he succeeded his father as duke of Richmond; became duke of Gordon 1876. He was president of the board of trade in Disraeli's cabinet, 1867-8, leader of the conservative party in the house of peers 1870, and in the 2d Disraeli ministry 1874, became lord president of the council. He favored the bill for abolishing church patronage in Scotland, and in 1875 introduced the agricultural holdings bill.

RICHMOND, COUNTESS OF. See BEAUFORT, MARGARET.

RICHMOND, DEAN, 1804-66; b. Vt.; received only a common school education, but acquired much information by reading. At an early age he removed to New York, became interested in political matters, was an active democrat, and obtained great influence in the state politics. He refused to accept any public office for himself. While a boy he entered the business of manufacturing salt at Salina, N. Y., and in 1842 opened a produce business in Buffalo. Here he became wealthy, and held office in several corporations. In 1853 he was made vice-president, and in 1864 president of the New York Central railroad.

RICHMOND, LEGH, 1772-1827; b. Liverpool; graduated at Trinity college, Cambridge, 1794; ordained in 1797; became curate in the Isle of Wight, 1798; chaplain to the Lock hospital, London, 1805, and the same year rector of Turvey. He was an earnest evangelical preacher. He published as tracts *The Dairyman's Daughter*, *The Negro Servant*, *The Young Cottager*;—(*Annals of the Poor*). Before 1849, four million of copies of the *Dairyman's Daughter* had been issued in 19 languages. He published also *Fathers of the English Church and Domestic Portraiture*.

RICHTER, JEAN PAUL FRIEDRICH, better known as "Jean Paul," a German humorist and sentimentalist of the greatest singularity, hence called by his countrymen *Der Einzige* (the unique), was b. at Wunsiedel, in Bavaria, Mar. 21, 1763. His father, who was a poor schoolmaster at the period of Richter's birth, subsequently became parish priest at Schwarzenbach, on the Saale; but his circumstances always remained straightened, and he died burdened with debt, while his son was attending the gymnasium at Hof. Nevertheless, Richter went to the university of Leipsic in 1780 to study theology, which did not prevent him from roving freely over the whole circle of literature. The exact extent of his scholarly acquirements cannot well be ascertained; his studies were never systematic, and it is probable that he was not deeply read in any single branch of learning, but he carried in his head or in his note-books a vast confused miscellany of facts, literary, scientific, philosophical, and theological, and strewed them with oriental profusion over the pages of his works, where they do duty as metaphors, or illustrations after the most grotesque and wonderful fashion. The English satirists, Pope, Swift, and Young, appear to have been special favorites with him; and among his own countrymen, Hamann and Hippel. But the most marvelous thing about his student-life was not the extent or variety of his reading, but the fact that he had the heart to read at all! During the whole time he was plunged in the most miserable poverty. He could hardly get a single private pupil, and passed many a day without tasting food. Hunger was, in truth, his constant companion. In desperation he betook himself to literature for a subsistence, but it was long before he won recognition. His first composition, *Das Lob der Dummheit* (The Praise of Folly), modeled on the *Moria Encomium* of Erasmus, could not find a publisher; his second, written, he tells us, while he was surrounded by "unpaid debts and unsold boots," *Grönländische Prozesse* (Greenland Lawsuits, 2 vols., Berl. 1783-85), did succeed in getting itself published but not read, and at length the heroic fortitude of Richter gave way. In 1785 he fled from the city to avoid incarceration for debt, and took refuge with his mother at Hof. Here his circumstances were little better; and in 1786 he was glad to accept a tutorship at Topen in the family of Herr von Oerthel. In 1790, at the request of several families of Schwarzenbach, he removed thither to take charge of the education of their children, and lived in this way as a private schoolmaster for some years. Meanwhile, he had not given up authorship. In 1788, appeared at Gera his *Anschauung aus des Teufels Papieren* (Selection from the Devil's Papers), which, however, in spite of its captivating title, did not prove more popular than its predecessors. Richter seemed destined to failure as a writer. His sarcastic, far-glancing, and grotesquely sportful humors were so unlike anything else in literature, and so oddly, not to say extravagantly, expressed, that the mass of readers could make nothing of them at all, and perhaps charitably regarded the author as crazy. But in 1793 the turning-point in his fortunes and fame occurred. In that year, a work which he had published at Berlin, *Die Unsichtbare Loge* (The Invisible Lodge), and which was a sort of romance based on his experience as a schoolmaster, proved unexpectedly successful, and Richter began to grow a little more familiar with the sight of gold. It was followed by *Iesperus* (4 vols., Berl. 1794), the work by which he is perhaps best known out of Germany; *Quintus Fierlein* (Baireuth, 1796); *Biographische Belustigungen unter der Gehirnschale einer Riesin* (Biographical Recreations under the Cranium of a Giantess, Berl. 1796); *Blumen-, Frucht-, und Dornenstücke* (Flower, Fruit, and Thorn Pieces, 4 vols., Berl. 1796-97), the opening chapter of which contains his magnificent "Dream of the Dead Christ," translated into English by Carlyle; *Jubel-senior* (The Parson in Jubilee, 1797), and *Das Campanerthal* (Erfurt, 1798), a work on the immortality of the soul, which attracted the

notice and won for its author the friendship of Herder. Richter was now one of the greatest celebrities of Germany; his books had become quite the rage, especially among educated women. He himself, too, was personally a great favorite; there was something in his conversation and manner so winning, joyous, and charmingly tender, that it excited not only friendship but love. We read of one brilliant woman, Charlotte von Kalb, who actually sought to obtain a divorce in order that she might marry Richter; and of another who committed suicide because he would not return her unlawful passion. This last incident affected Richter profoundly. He was not only perfectly innocent in all his relations with the other sex, but pure and high-minded to a degree, and he had remonstrated with the unhappy maiden in the most wise and delicate manner. In 1801, after he had become famous, he married Caroline Mayer, daughter of prof. Mayer of Berlin, and with his young wife traveled about Germany a good deal, visited Goethe and Schiller, with neither of whom, however, he became intimate, and formed a closer acquaintance with old Gleim, Wieland, etc.; but ultimately settled at Baireuth, in Bavaria, where he devoted his time with the most honorable assiduity to work. His aerial, fantastic, many-hued creations—his solemn images of glory and gloom—his *riant* humors—his burlesque speculations on life, manners, and, indeed, on the *omne scibile*—his innumerable descriptions of nature, soft-glittering as with morning dew, flowed from him as from inexhaustible fountains. The productions belonging to his later period of a humorous kind are: *Thun* (4 vols., Berl. 1800-3), considered by Richter himself his greatest work; *Flügel Jahre* (happily rendered by Carlyle "Wild Oats," 4 vols., Tüb. 1804-5); *Katzenberger's Badereise* (2 vols., Heidelb. 1809); *Des Feldpredigers Schmelzle Reise nach Plätz* (Tüb. 1809); and *Der Komet, oder Nikolaus Markgraf* (3 vols., Berl. 1820-22). Among works of a professedly reflective or philosophical character (though the elements of humor and poetry are by no means absent), we may mention his *Vorschule der Aesthetik* (3 vols., Hamb. 1804); *Levana oder Erziehungslehre* (Brunswick, 1807), a treatise on education; and numerous other pieces. Richter died Nov. 14, 1825. In his latest years he was afflicted with a decay of his physical powers, and in his last year with total blindness. The death of his son Max, in 1821—a youth of great promise—inflicted an incurable wound on his heart.—See *Wahrheit aus Jean Paul's Leben* (Bresl. 1826-33), a work begun by Richter himself; *Döring's Leben und Charakteristik Richters* (3 vols., Leip. 1830); *Spazier's Jean Paul Friedrich Richter ein Biographischer Commentar zu dessen Werken* (5 vols., Leip. 1833). Some of his pieces have been translated into English by Carlyle and others; Carlyle has also given us two admirable essays on the life, writings, and genius of the man, to which we refer our readers.

RICIMER, d. 472; a general of barbarian origin, who was virtually master of the Roman empire from 460 to his death, enthroning and deposing several emperors. He dethroned Avitus in 456, had Majorianus assassinated in 461, Vibius Severus in 465, and Anthemius 472. Olybius, the last emperor whom he raised to the throne, died the same year with Ricimer.

RICINUS. See CASTOR-OIL PLANT.

RICKAREES, or **ARICARAS**, a tribe of Pawnee Indians, originally allied to the Platte river Pawnees. They now number from eight to nine hundred, having decreased rapidly since the coming of the whites. They were badly defeated by the Dakotas in the early part of the century; and in 1823, having committed outrages on whites, were defeated and dispersed by troops. In 1825 a treaty was made with them, and for some years they left the Missouri region, but returned and remained near fort Berthold in league with the Mandans and Minnetarees. They are now in Dakota and Montana on a large reservation set out for them in 1870. Very little advance in civilization has been made, and they have had less benefit from the establishment of missions than many Indian tribes.

RICKETS, or **RACHI'TIS** (from the Gr. *rhaehis*, the spine, because a peculiar form of spinal curvature results from the affection), is regarded by some writers as a special disease of the bones, and by others as merely one of the various forms of scrofula. Whichever view be correct, there can be no doubt that the general symptoms in rickets are closely allied to those in scrofula, and that the same general plan of treatment is equally useful in both affections. The characteristic symptom in rickets is the imperfect development, atrophy, softness, and consequent distortion of some or many of the bones. The bones thus affected consist of a sort of gelatinous tissue, which will bend without breaking; and they are so soft that they may be cut with the knife. On microscopic-chemical examination, the structural arrangement of the bone is found to be unaffected, while there is a great deficiency of the earthy salts to which the normal bones owe their firmness. While 100 parts of healthy bone contain about 32 per cent of organic matter, and 68 per cent of inorganic matter, or earthy salts, the proportions are altogether reversed in rickets. Thus, in this disease, Marchand found 79.4 per cent of organic matter, and 20.6 per cent of earthy salts in a femur; while Ragsky found 81.12 per cent of organic matter, and only 18.88 of earthy salts in a humerus: thus showing that these bones contained less than one-third of the normal quantity of earthy salts. The weight of the body acting on bones thus constructed causes them to bend, and the thighs or shins are abnormally arched, or the spine is curved, or, in slighter cases, only the normal form of the ankle is modified. In aggravated cases, the chest is so affected as to give

rise to the condition known as *pigeon-breasted*; the lower jaw is imperfectly developed, and the teeth project; and the pelvis becomes so altered in form as to render future childbearing in the highest degree perilous. Rickets is exclusively a disease of childhood, and generally attacks the children of the poor.

The treatment must be mainly directed to the improvement of the general health. Free exposure to pure bracing air, sponging with sea-water, or sea-bathing, if the little patient can bear it, an abundance of animal food, cod-liver oil, iron, and quinia, include all that need be said about general treatment. Dr. Druitt recommends a jelly containing phosphate of lime (with the view of restoring to the bones the salt in which they are specially deficient). It is well worthy of further trial, and may be prepared as follows: Boil about four ounces of ivory-dust in water for ten minutes; then strain off the water and throw it away with the impurities which it has taken up. Add more water, in which the dust should be stewed till the jelly is extracted, and the dust itself is soft enough to crush between the teeth. Lemon-juice, wine, sugar, or other flavoring ingredients may be added: and the softened ivory-dust should be eaten with the jelly.

When a child with crooked legs is brought to a surgeon, he must carefully ascertain whether the crookedness depends on mere relaxation of the joints, or whether it lies in the bones themselves. In the former case the child will probably grow up straight when his general health improves; whereas in the latter case (if the femur or tibia is absolutely bent), the surgeon must give a very guarded opinion.

RICKETTS, JAMES B., b. New York; graduate of West Point 1839, became 1st lieutenant of artillery 1846, served in the Mexican war and was made capt. in 1852. In the war of the rebellion he was taken prisoner at the first battle of Bull Run and confined at Richmond 8 months. Before the second battle of Bull Run he was exchanged, afterward promoted to brig. gen., and was wounded in that engagement. He commanded gen. Hooker's corps at Antietam after that officer was disabled, and was actively engaged throughout the Richmond and Shenandoah campaigns. He was brevetted for bravery at Bull Run, Cold Harbor, and Cedar Creek; maj. gen. 1865; retired 1867.

RICKMAN, THOMAS, a distinguished architect, was born at Maidenhead in 1776. He was unsettled in early life, and tried several employments both in London and Maidenhead. He managed his father's business of druggist for some time, and afterward became a clerk in an insurance office. He seems to have always had a love for architecture, and to have studied it carefully. In 1803 he began to give his full attention to it, and wrote the classification of Gothic styles, which has rendered him famous. He first pointed out the features which distinguish the different periods of that style. He divided it into four periods, and called them Norman, early English, decorated, and perpendicular (q. v.), and these names and the dates he assigned to them are still the most frequently used.

Rickman became after this an architect in Birmingham, and was employed to design a great many buildings, especially churches. He died in March, 1841. His work is called *An Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation*. It was first written for Smith's *Panorama of Science and Art*, and has passed through several editions; that by Parker of Oxford (1847) is the best.

RI COCHET, in artillery, is the bounding of a shot along the ground, which takes place when a gun is fired low. Ricochet firing is found extremely useful both in its actual and moral effect in clearing the face of a ravelin, bastion, or other rather long line of fortification. If well directed the ricochet shot bounding along will dismount guns, scatter the gunners, and greatly intimidate the garrison. Vauban first introduced ricochet firing at the siege of Philipsburg in 1688. The defense against this sort of attack consists in earthen traverses along the threatened line, or in a bonnet (see FORTIFICATION) at the point of parapet nearest the enemy. In the field, ricochet, where the shot or shell is made to bound forward at least ten times, produces most disastrous and demoralizing effects on masses of cavalry and infantry, whom it hews down in long lines.

RICORD, PHILIP, a distinguished French physician, was the son of a wealthy ship-owner, and was born Dec. 10, 1800, at Baltimore, whither his father had gone in 1790 to repair his fortunes, which he had lost under the India company. He came in 1820 to Paris, where he was attached in succession to the Hôtel-Dieu under Dupuytren, and to the Pitié under Lisfranc. He graduated as doctor in medicine in 1826; but was unable, from the scantiness of his private means, to begin practice in Paris. His professional career, therefore, commenced at Olivet, near Orleans, and was thence transferred to Croÿ-sur-Ourcq, where he rapidly rose to distinction as a practitioner. In 1828 he returned to Paris, where he delivered two annual courses of lectures at the Pitié on surgical operations; and was appointed surgeon-in-chief to the hospital for venereal diseases. This post he held with brilliant success till his retirement in Oct., 1860. It was here that he won his world-wide reputation in the specialty which he had chosen—a reputation which he owed to his combination of accurate physiological and pathological knowledge with great manual dexterity as a surgeon, and felicitous inventiveness and resource as a physician. He did much to improve the classification of enthetic diseases; and at the venereal hospital delivered annually, from 1834, a course of lectures on syphilology, for which a special amphitheater was granted to him. For his suggestions on the cure of

varicocele and on the operation of urethro-plasty he received in 1842 one of the Montyon prizes. M. Ricord's practice is the most extensive and the most lucrative in Paris, inasmuch that while an inmate of the debtors' prison at Clichy, he was literally besieged by crowds of patients. He has been since 1850 member of the academy of medicine (section of surgical pathology); member of the surgical society; and consulting surgeon to the dispensary of public health. In 1862 he was appointed physician in ordinary to prince Napoleon; and in 1869 consulting surgeon to the late emperor; having already on Aug. 12, 1860, been raised to the distinction of commander of the legion of honor. His works are numerous, the more important of them being these: *On the Employment of the Speculum Biviale* (1833), invented by himself; *On the Blennorrhagia of the Female* (1834); *On the Employment of Mercurial Ointment in the Treatment of Erysipelas* (1836); *The Monography of the Chancre* (in which he gives a detailed exposition of his own system); *Theory of the Nature and Treatment of Epididymitis* (1838); *Treatise on Venereal Maladies* (1838); *On Blennorrhagic Ophthalmia* (1842); *Iconographical Clinic of the Venereal Hospital* (1842-51); and *On Syphilization and the Contagion from Secondary Accidents* (1853). He has also contributed to the medical journals a multitude of memoirs, observations, researches, and communications on his speciality. His latest works are those entitled *Letters on Syphilis* (3d ed. 1863), and *Lectures on Chancre* (2d ed. 1860), both remarkable for their fluency and grace of style.

RIDDLE (Ger. *räthsel*), a paraphrastic presentation of an unmentioned subject, the design of which is to excite the reader or hearer to the discovery of the meaning hidden under a studied obscurity of expression. In the present day the riddle is a mere *jeu d'esprit*—a sort of witty pastime for idle people; we only meet with it under the form of conundrum (q. v.), but anciently—and its antiquity is very great—it held a far higher place, and was put to far more important uses, although in its inferior phase of conundrum it was likewise a part of the intellectual entertainment at Greek and latterly at Roman banquets. Among the easterns it naturally associated itself with their symbolical modes of thought, and was also, as it still is, abundantly employed for didactic purposes. The so-called Proverbs or sayings attributed to Solomon frequently assume the form of riddles. Josephus relates, on the authority of Dios the Phenician historian, and of Menander of Ephesus, that Hiram king of Tyre and Solomon had once a contest in riddles or dark sayings, in which Solomon first won a large sum of money from Hiram, but ultimately lost it to Abdemon, one of Hiram's subjects—a curious instance of philosophical gambling. Every reader of the Old Testament is familiar with the riddle which Samson proposed to the Philistines, and the "enigmas" (as the Septuagint has it) that the queen of Sheba proposed to Solomon, though it is perhaps doubtful if the latter were more than hard or difficult questions plainly put. The riddle is found in the Koran, and several books of riddles exist in Arabic and Persian. It would appear that they were also known to the ancient Egyptians, while among the Greeks they were allied in the earliest times with the *oracula*, or mystic utterances of the inspired priests, and were generally, as is the case with Samson's riddle, in verse; but in Greece they first came into vogue about the time of the "seven wise men," one of whom, named Kleobulos, as also his daughter Kleobuline, was celebrated for the composition of metrical riddles (*griphoi*), some of which are still remembered. Even the greater poets did not refuse to introduce the riddle into their writings, or to devote whole poems to the subject—e. g., for example, the *Syrinx*, commonly ascribed to Theocritus. Homer, according to a statement in Plutarch, died of chagrin at not being able to solve a riddle; and the riddle of the Sphinx (see **EDIPUS**) is probably the most celebrated in the whole circle of philosophical puzzles. Among the Romans professional riddle-makers did not make their appearance till the latest period of Roman literature, the reason assigned for which is the superior gravity and earnestness of the Roman genius, which, it is said, did not easily find pleasure in such modes of intellectual activity. Appuleius wrote a *Liber Ludicorum et Griphorum*, but it is no longer extant, and almost the only name we can fix upon is a certain Caelius Firmianus Symposius, whose riddles, comprising a hundred hexametrical triplets, are termed by Aldhelmus (8th c.), apparently with justice, *carmina inepta*.

The riddle—but more perhaps as an amusement for the baronial hall on winter nights, or for the monastic mess-room, than as a serious intellectual effort—was much cultivated during the middle ages. This character of lively or amusing puzzle it has ever since for the most part retained. Many specimens of what would now be termed "riddle" or "conundrum books" exist in French, English, and German collections of manuscripts, and were printed at an early period. One of these, entitled *Demandes Joyeuses*, which may be rendered "amusing questions," was printed in English by Wynkin de Worde in 1511. Many of these "joyous demands" are simply coarse jests; but others, again, illustrate the simple, child-like religious belief of mediæval Christendom—e. g., demand: "What bare the best burden that ever was borne?" Response: "The ass that carried our lady when she fled with our Lord into Egypt." Some are really fitted to excite risibility—e. g., demand: "What is that that never was and never will be?" Response: "A mouse's nest in a cat's ear."—"What is the worst-bestowed charity that one can give?" "Alms to a blind man; for he would be glad to see the person hanged that gave it to him." The reformation, at least in Protestant countries, checked, if it did not wholly

stop, the merry pastime of riddle-making, but in the 17th c. it began to creep into favor again. Le père Ménestrier, a learned Jesuit, wrote a grave treatise on the subject; and in France riddles soon rivaled in popularity the madrigals and sonnets of the period. The abbé Cotin was a famous fabricator of riddles, and published a *recueil* of his own and those of his contemporaries, preceded by a dissertation, in which he modestly dubbed himself *Le Père de l'Enigme* (the father of the riddle); but, as a French critic remarks, posterity has not recognized his paternity. In the 18th c. the taste for the manufacture of riddles continued to increase, and most of the brilliant French *littérateurs*, such as Boileau, Voltaire, and Rousseau, did a little in this line, until, finally, the *Mercur de France* became a fortnightly repository of riddles, the solution of which was sufficient to make a reputation in society. In Germany Schiller gave a broader development to the riddle. In his hands it once again became something grave and sibylline, and attained in expression a high degree of literary beauty and force. A good collection of the best riddles is to be found in Ohnesorgen's collection, entitled *Sphinxæ* (6 vols. Ber. 1833).

RIDDLE, JOSEPH ESMOND, 1804-59; b. England; educated at Oxford. He took orders in the English church, was for some time curate at Harrow, and from 1840 to his death, rector of a church in Leckhampton. His best-known work is *A Copious and Critical Latin-English Lexicon*, which he edited, in conjunction with T. K. Arnold, from the German of Freund. He published *An English-Latin Dictionary* in 1849.

RIDGE, the upper angle of a roof, usually covered with lead or zinc, and sometimes with stone or tile. Ridges are often ornamented with a cresting or running design, and recently cast-iron has been much used for this purpose.

RIDGELY, JAMES LOT, b. Baltimore 1807; educated at St. Mary's college; studied law; admitted to the bar in 1828, and began practice at Baltimore. He has held many local political offices, the most important of which was the collectorship of internal revenue, and was for some time at the head of the city educational system. He has been prominent in the order of odd fellows, in which he has occupied very high official positions, and has published several hand-books and periodicals. Since 1855 he has been president of an insurance company.

RIDING (Saxon, *trithing*, third part), a term applied to three parts into which the county of York is divided, termed respectively East, West, and North Riding. A similar division existed in several other counties in the Anglo-Saxon period; there were the *laths* of Kent, the *rapes* of Sussex, the *parts* of Lincoln. The trithing, lath, or rape was formed of three or more hundreds, and presided over by a trithing-man or lath-grieve. In *Domesday Book* we find Yorkshire divided, as at present, into three ridings, and subdivided into wapentakes. See WAPENTAKE.

RIDING-MASTER, an officer in the cavalry, military train, and artillery, whose duty it is to instruct the officers and men in the management of their horses. He is most commonly selected from the ranks; his pay is 9s. a day, rising by length of service to 10s. 6d. and 12s.; besides which he receives £7 per troop per annum for riding-house expenses; and he is believed to make some profit out of this allowance. The riding-master has the relative rank of lieutenant, and, after an aggregate service of 30 years, including at least 15 years as riding-master, he has the right to retire on 10s. a day, with the honorary rank of captain.

RIDLEY, NICHOLAS, one of the most noted leaders of the reformation in England in the 16th c., was a native of Northumberland, and b. about the commencement of the century. He was educated at the foundation-school of Newcastle-upon-Tyne; and subsequently at Pembroke hall, Cambridge. He became a fellow of this college in 1524, and ultimately president. The spirit of the reformation had already begun to penetrate the universities both of Oxford and Cambridge. Tyndale and Bilney had taught the new doctrines in the latter place; and Ridley, no less than Cranmer and Latimer, all Cambridge students about the same period, had probably caught something of their spirit. This reforming tendency was greatly strengthened by a tour on the continent of Europe, which he undertook on the completion of his studies. He encountered some of the most active reformers abroad, and after a three years' absence, he returned, with his principles firmly grounded in favor of the new course of things. He became proctor to the university of Cambridge, and in this capacity protested against the claims of the papal see to supreme ecclesiastical jurisdiction in England. He was also chosen public orator, and, under the patronage of his friend Cranmer, advanced first to be one of the king's chaplains, and then, in 1547, nominated bishop of Rochester. He distinguished himself by his vehement denunciations of the idolatrous use of images and of holy water, and very soon became one of the most prominent, as he remained one of the most consistent and inflexible, supporters of the reformed doctrines. He joined actively in the measures of Edward VI's reign, and on the deprivation of Bonner, bishop of London, Ridley became his successor, three years subsequent to his elevation to the see of Rochester. In this high position he distinguished himself by his "moderation, his learning, and his munificence." He earnestly promoted the reformation, yet without bigotry or intolerance; he exerted himself in the foundation of Christ's hospital, and of the hospitals of St. Bartholomew and St. Thomas in Southwark, the two latter of which have become

eminent as schools of medicine—the former as a school of classical and general instruction. He assisted Crammer in the preparation of the 41 articles, afterward reduced to 39. On the death of Edward VI. he warmly espoused the unfortunate cause of lady Jane Grey; and on its speedy failure, and the accession of Mary, his known connection with it, as well as his general activity in the cause of the reformation, exposed him to the vengeance of the papal party, again ascendant. He was committed to the Tower in 1553, and in the subsequent year, when a convocation was convened at Oxford for the discussion of the doctrine of transubstantiation, he was removed thither along with Crammer and Latimer, in order that he might engage in the discussion. It was not to be expected, however, that any good would issue from such a step as this. The discussion proved a mere pretense; the reformers were adjudged defeated and obstinate heretics, and condemned to suffer at the stake. On Oct. 16, 1555, Ridley was led forth to execution, along with his friend and fellow-reformer, Latimer. He suffered in front of Balliol college, cheerful, steadfast, and consistently enduring as he had been throughout his life. He was, according to Burnet, one of the ablest of all who advanced the reformation in England. His character is pure, elevated, and self-denying. Foxe says of him he was “wise of counsel, deep of wit, benevolent in spirit.” His gentleness wins our sympathy, while his scholarly and calm intrepidity excite our admiration.

RIDOLFI, ROBERTO, b. Italy; established himself in London as a banker in 1554. He became a secret agent for the pope and several continental sovereigns. He participated in several conspiracies against Elizabeth. He visited Madrid in 1571, and proposed to Philip II, a plan for assassinating Elizabeth. This plan he claimed to be the work of the English Roman Catholics, and to have received the sanction of the pope—of which, however, there is no evidence except his assertion. The duke of Alva opposed it, but Philip partially approved it. The plot was discovered in England, and the principals punished.

RIE'DESEL, FRIEDRICH ADOLPH, Baron von, 1738-1800; b. Germany; studied at Marburg. He served in the 7 years' war, and in 1776 took command of 4,000 Brunswick troops, hired by Great Britain for service against the American colonies. He assisted in the capture of Ticonderoga, and in the British success at Hubbardton; was made prisoner at Burgoyne's surrender, and was exchanged in 1780. He was appointed lieutenant-gen. in 1787, and commanded the Brunswickers in Holland. His wife, **FREDERICA CHARLOTTE LOUISA**, 1746-1808, b. Prussia, daughter of Massow, the Prussian minister, came with her husband to America, and has left an interesting account of their American adventures.

RIE'GO Y NUÑEZ, RAFAEL DEL, 1785-1823; b. Oviedo, Spain. He joined in the patriot movement which followed the making of Jerome Bonaparte king of Spain, and in 1808 was captured by the French. He was a prisoner until 1814, when he visited Germany and England. In 1820 he was the chief in the popular agitation which brought about the restoration of the Spanish constitution of 1812, and in 1823 was president of the cortes. He bitterly opposed French intervention, and when that took place was captured, tried as a traitor, and put to death at Madrid. His body was quartered. In his honor was composed the *Hymn of Riego*, a popular national song in the days of the republic.

RIENZI, COLA DI, the famous Roman tribune, was b. at Rome in 1313. His parentage was humble, his father being a tavern-keeper, named Lorenzo (by abbreviation Rienzio), and his mother a washerwoman. Until his twentieth year he lived among the peasants of Anagni; then he returned to his native city, where he studied grammar and rhetoric, read and reread the Latin historians, philosophers, and poets (Greek was scarcely yet known in Italy), and excited his imagination, while at the same time he colored his speech with the prophetic enthusiasm of the inspired writers. The assassination of his brother by a Roman noble, whom he found it impossible to bring to punishment, is considered to be the incident that finally determined him to deliver the city, as soon as he was able, from the barbarous thralldom of the barons. He assumed the significant title of “consul of orphans, widows, and the poor.” In 1343 he was appointed by the heads of the Guelph party spokesman or orator of a deputation sent to the papal court at Avignon to beseech Clement VI. to return to Rome in order to protect the citizens from the tyranny of their oppressors. Here he formed a close friendship with Petrarch, through whose assistance he obtained a favorable hearing from his holiness, who appointed him notary to the city chamber. In April, 1344, Rienzi returned home, and sought to obtain the countenance of the magistrates in his ideas of reform; but reform, he found, was impossible without revolution; yet he did not *conspire*, properly speaking, to the very last moment. During three years he loudly and openly—perhaps even ostentatiously—menaced the nobles, for the enthusiasm of Rienzi for a nobler and juster government, though sincere, was showy and vain. The reason why the nobles took no steps to crush him was because they thought him mad. At last when Rienzi thought he could rely on the support of the citizens he summoned them together on May 20, 1347, and surrounded by 100 horsemen and the papal legate he delivered a magnificent discourse, and proposed a series of laws for the better government of the community, which he termed *il buono stato*, and which were unanimously approved of. The aristocratic senators were driven out of the city, and Rienzi was invested with dic-

tatorial power. He took the title of "tribune of liberty, peace, and justice," and chose the papal legate for his colleague, but reserved to himself the direction of affairs, after having, however, suggested the institution of a syndicate, to which he should be responsible. The pope confirmed the eloquent dictator in his authority; all Italy rejoiced in his success, and foreign lands, even warlike France (according to Petrarch), began to dread the reviving majesty of the eternal city. A bright dream now seems to have flashed across Rienzi's imagination—the unity of Italy and the supremacy of Rome! Every great Italian has dreamed that dream from Dante to Mazzini. Rienzi dispatched messengers to the various Italian states, requesting them to send deputies to Rome to consult for the general interests of the peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on Aug. 1, 1347, 200 deputies assembled in the Lateran church, where Rienzi declared that the choice of an emperor of the holy Roman empire belonged to the Roman people, and summoned Ludvig of Bavaria and Karl of Bohemia, who were then disputants for the dignity, to compare before him. The step was wildly impolitic. Rienzi had no *material* power to enable him to give efficacy to his splendid assumption. The pope was indignant at the transference of authority from himself to his subjects; and the barons, taking advantage of certain ceremonial extravagances which the dictator had committed, and which had diminished the popular regard for him, gathered together their forces, and renewed their devastations. After some ineffectual resistance Rienzi resigned his functions, weeping all the while, and withdrew from Rome, which was entered by the barons two days after. His tenure of power had lasted only seven months. In the solitudes of the Neapolitan Apennines, where he found refuge, Rienzi would seem to have recovered his enthusiasm and his faith. Regarding his fall as a just chastisement of God for his love of worldly vanities he joined an order of Franciscan hermits, and spent nearly two years in exercises of piety and penitence—all the while, however, cherishing the hope that he would one day "deliver" Rome again. This ambition to play a distinguished part made him readily listen to a brother-monk, who, about the middle of 1350, declared that, according to the prophecies of Joachim of Flores, of Cyrillus, and of Merlin, Rienzi was destined, by the help of the emperor Karl IV., to introduce a new era of happiness into the world. Rienzi betook himself at once to Prague, and announced to the emperor that in a year and a half a new hierarchy would be established in the church, and under a new pope Karl would reign in the west and Rienzi in the east. Karl, not knowing very well what to say in reply to such language, thought it safest to put the "prophet" in prison, and then wrote to inform his friend the pope of the matter. In July, 1351, Rienzi was transferred to Avignon, where proceedings were opened against him in reference to his exercise of tribunitial power. He was condemned to death, but his life was spared at the earnest entreaties of Petrarch and others; and the next two years were spent in an easy confinement in the French papal city. Meanwhile the state of matters at Rome had become worse than ever. The great families were even more factious, more anarchical, more desperately fond of spilling blood than formerly; and at last Innocent VI. sent cardinal Athornoz to re-establish order. Rienzi was also released from prison, and accompanied the cardinal. A residence was assigned him at Perugia; but in Aug., 1354, having borrowed money, and raised a small body of soldiers, he made a sort of triumphal entry into Rome, and was received with universal acclamations. But misfortune had impaired and debased his character; he abandoned himself to good living, and his once generous sentiments had given place to a hard, mistrustful, and cruel disposition. The barons refused to recognize his government, and fortified themselves in their castles. The war against them necessitated the contraction of heavy expenses; the people grumbled; Rienzi only grew more severe and capricious in his exactions and punishments. In two months his rule had become intolerable, and on Oct. 8 an infuriated crowd surrounded him in the capitol, and put him to death with ferocious indignities.

RIE SENGEIRGE (giant mountain), a mountain range about 23 m. long by about 12 m. broad, between Bohemia and Prussian Silesia. See **BOHEMIA**.

RIE SI, a t. of Sicily, in the province of Caltanissetta, and 13 m. s. from Caltanissetta. It is situated at the base of a mountain of the same name, not far from the left bank of the Salso. There are sulphur mines in the mountain. Pop. '71, 11,548.

RIE TI (ancient, *Reate*), a city of central Italy, in the province of Perugia in Umbria, is situated at the foot of a hill, on the banks of the Velino, 45 m. n.e. of Rome. It is walled, its streets are regular, and it has a fine cathedral, and many benevolent institutions. It is the seat of an archbishop. Rieti was a noted city of the Sabines. Pop. 12,900.

RIFF, THE, a portion of the coast of Morocco which extends from Tangier on the w. to near the western frontier of Algiers, having a length of about 210 m., with a breadth of 58. The name, in the Berber language, which is that of the inhabitants, signifies a mountainous and rugged coast. The Riff mountains, which stretch along near and parallel to the coast, are green and wooded, and are here and there intersected transversely by fertile valleys or deep ravines, each of them possessing its brook or rivulet, which descends to the Mediterranean. The Riff region is separated from the parallel mountain chain s. of it by an extensive, fertile, and well-watered plain, in which stands

the city of Fez. The inhabitants of the Riff are almost wholly Berbers, who are employed in feeding and breeding cattle, fishing, and occasional piracy. On account of the injuries inflicted by them on merchant vessels, most of the maritime states of Europe agreed to pay an annual sum as quit-money. However, in 1828, Austria declined further payment of the tax. A Venetian vessel was seized by the pirates, in the harbor of Rabat, but the arrival of an Austrian fleet off the port produced restitution of the ship and its cargo, as well as the formal renunciation of all further claims. France followed the same course by declaring war against the sultan of Morocco, and obtained compensation, in 1844, since which period piracy has much diminished. Its example was followed by the Spaniards in 1859. The sultan, however, had always discouraged piracy, but his authority in the Riff was too weak to compel obedience.

RIFLE-BIRD, *Ptiloris Paradiseus*, a bird of the family *upupidae*, with a long curved bill, and in size about equal to a large pigeon. It inhabits the s.e. districts of Australia, and is found only in very thick "bush." The male is regarded as more splendid in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green, of most brilliant luster. The tail is black, the two central feathers rich metallic green.

RIFLED ARMS were invented for the purpose of remedying certain defects essentially connected with cylindrical smooth-bore guns. These defects, which are chiefly owing to atmospheric resistance, showed themselves in the erratic motion of the ball, especially when fired at a long range, and arose from the following causes: *First*, The ball never fitted tightly, and, in consequence of this, its center was below the center of the bore. A portion of the explosive force of the powder escaped over the top of the bullet, and was not only wasted, but exercised a downward pressure on the ball, tending to squeeze it into the under side of the barrel, and so great was this pressure that in guns of soft metal, as brass, a perceptible dint was produced after a few rounds. Another and more important consequence of the looseness of the ball was that the action of the powder on it was necessarily irregular, and its resulting motion along the barrel was a series of oblique impacts, now against one side, now against the other, and the direction of its motion after expulsion was necessarily not in line with the axis of the barrel, and depended upon the side of the barrel with which it was last in contact. *Secondly*, Balls can never be perfectly homogeneous, and the violent and sudden pressure of the exploded powder produces a slight change of shape; consequently the center of gravity can never accurately coincide with the center of the sphere, the air resists its forward motion unequally, and true flight is precluded. *Thirdly*, As a consequence of the friction of the ball against the sides of the barrel, it acquires a rotatory motion, the direction of its rotation after expulsion being determined by the particular point of the muzzle with which it was last in contact. Thus, if it finally touched the top or bottom of the muzzle, the plane of rotation of the anterior surface of the ball would be in line with its progressive motion, and the rotation would be in an upward or downward direction; if it last rebounded from the right side, the plane of rotation would be in line with its path, and the rotation of the anterior surface from left to right, and so on. The ball, in its rapid flight, compresses the air in front, and produces a vacuum behind; the denser became more compressed, air in front, attempts to rush round the sides of the ball to fill up the vacuum. Now let us suppose that the ball, while in rapid advance, is also revolving in a horizontal plane, and from left to right, the left side, whose rotation *conspires with* the motion of translation, resists, by its friction, the attempt of the air to reach the vacuum by that side; while the right side, whose rotation is against the motion of translation, conspires to aid the air in reaching the vacuum. It follows from this that the air is denser in front of the left side than in front of the right; its resistance on the left side is greater than that on the right, and the ball, in consequence, is deflected toward the side on which the resistance is least (toward the right in this instance). If the ball struck the top of the muzzle, its revolution would be in a vertical plane in line with the barrel, and in an upward direction, under which circumstances the ball would tend, first, downward from the first reason, and then upward from the third; while, if it struck the bottom of the muzzle, the contrary would be the case. These aberrations of the ball from its true theoretical path, as was evident to artilleryists, could never be wholly annihilated while smooth-bores were used, and they set themselves to discover how they might be counteracted. It occurred to them that this could best be managed by securing that the plane of rotation of the ball should be at right angles to its motion of translation, as the irregularities in its structure, which produce aberrations of the first and second kind, would thus act equally in all directions, producing an exact counterbalance, while the aberration from the ball's rotation would wholly disappear; and the constancy of the vertical transverse position of the plane of the ball's rotation was obtained by making one or more spiral grooves along the interior of the barrel.

As early as 1498 the citizens of Leipzig possessed the germ of the future rifle, for their arms had a grooved bore, but the grooves were straight. Not many years after, in 1520, Augustin Kutter (or Koster) of Nuremberg was celebrated for his rose or star-grooved barrels, in which the grooves had a spiral form. It took its name from the rose-like shape of the bore at the muzzle; and, setting aside superiority of workmanship

subsequently developed, Kutter's arm was the veritable rifle, and to him, therefore, so far as history shows, is due the invention of this terrible weapon, which reduces the flight of the projectile to a question of the individual skill of the marksman. The spiral groove gives to the bullet, if it fits into the grooves, a rotation rapid in proportion to the force of the explosion and the sharpness of the twist in the spiral. This revolution of the bullet on its own axis keeps that axis, gravity excepted, in the line in which it leaves the piece. In 1628 Arnold Rotsiphen patented a new way of "making gones," which, from a subsequent patent granted him in 1635 appears to have consisted, among other improvements, in rifling the barrels. It would be tedious to enumerate the various principles of rifling which were tried during the two centuries following Rotsiphen—suffice it to say that scarcely a form of rifling now prevails but had its prototype among the old inventions. The difficulty of mechanical appliances making the rifling true, deferred, however, their general introduction, and the cost of rifled arms limited their use to the purposes of the chase. The revolutionary government of France had rifles issued to portions of their troops, but they met with so indifferent a success that Napoleon recalled them soon after he came to power. In the peninsula, however, picked companies of sharpshooters practiced with rifles with deadly effect on both the English and French sides. During the American war, 1812-14, the Americans demonstrated incontrovertibly the value of rifles in warfare; but many years were yet to elapse before they were definitively placed in the hands of soldiers. Many of those of every nation in the Crimea having fought with the ineffective and almost ridiculous "Brown Bess." Soon after the French invaded Algeria, they had armed the chasseurs d'Orleans with rifles, to counteract the superior range of the Arab guns. The inutility of the old musket was shown in a battle during the Kaffir war, where our men discharged 80,000 cartridges, and the loss of the enemy was 25 men struck. After experiments with the old musket, it was found that its aim had no certainty whatever beyond 100 yards. It was soon discovered that a spherical ball was not the best missile; one in which the longer axis coincided with the axis of the gun flying truer—the relative length of the axis and the shape of the head being matters of dispute. The first war-rifle was that of capt. Delvigne, proposed in 1826, and adopted for a few men in the French army; but this still included the old and rude plan of forcing the leaden ball through the grooves by blows of the ramrod, it being of course requisite that the projectile should occupy the grooves tightly. In 1842 col. Thouvenin invented a *carabine à tige*, in which the breech had a small pillar screwed into it, round which the powder lay, and on the end of which the bullet rested, its base being flattened out by the force of the ramrod. Col. Delvigne added a conical bullet to this rifle, and the combined invention was issued to the chasseurs d'Afrique in 1846. But the *tige*, or pillar, became bent by usage, and was found otherwise objectionable. It was superseded by using with a grooved barrel the minie bullet, which, being made smaller than the bore of the piece, could be almost dropped into the barrel. It was of lead, and in its base it contained a conical recess, to receive the apex of a smaller iron cup. The force of the explosion drove this cup into the bullet, causing the lead to expand into the grooves of the barrel. (It is right, however, to state that this contrivance is claimed for a Mr. Greener as early as 1836.) The Prussians, meanwhile, had armed their troops with the needle-rifle (*Zündnadelgewehr*), now superseded by the *Dreyse*. In England, however, no improvement took place until 1851, when 28,000 rifled muskets to fire the minie bullet were ordered to be issued. Notwithstanding the many advantages of the minie system, it was found defective in practice. Experiments were set on foot in all directions, and resulted in 1853 in the production of the Enfield rifle, which had three grooves, taking one complete turn in 78 in., and fired a bullet resembling the minie, except that a wooden cup was substituted for one of iron. From 1853 to 1865 this was the weapon of the British army. In 1865 the adoption of breech-loading arms (q.v.), caused the Enfield to be converted into a breech-loader by fitting the "Snider" breech mechanism to the Enfield barrel.

This arrangement was, however, only temporary, and after a most exhaustive series of trials before a special committee on breech-loading rifles, the Henry barrel was in 1871 adopted in conjunction with the Martini breech for the new small-bore rifle for the British army, now known as the Martini-Henry rifle. No fewer than 104 different kinds of breech-loading small-arms were submitted to this committee, who decided that the Henry 45-in. bore barrel "was the best adapted for the requirements of the service," on account of its "superiority in point of accuracy, trajectory, allowance for wind, and penetration," and also on account of its great durability. The Henry system of rifling is the invention of Mr. Alexander Henry, gunmaker, Edinburgh, and its essential peculiarity consists in the form of the rifle bore.

The rifling represents a septilateral figure with angular projections extending inwards from the angles of the planes. In other words, the rifling forms 7 plane surfaces, and the periphery of the projectile touches the planes at the center. In addition to the bearing surfaces thus obtained, there are 7 angular projections which extend inward from the planes, so that the apex of each of the projections is concentric with the center of the surfaces of its contiguous planes. These seven ridges thus afford a further bearing or support to the projectile, and by this means double the points of bearing are obtained. These angular ridges fill up to a great extent the spaces between the

angles of the planes and the periphery of the projectile, thus reducing the windage, and from their peculiar construction facilitating the expansion of the bullet to the major diameter of the bore, so that the rotatory or spiral motion of the projectile is obtained with greater certainty; at the same time, the figure of the projectile is so little altered that it traverses through the air with less resistance, and consequently its flight is rendered more accurate.

The length of the Henry barrel is $32\frac{1}{2}$ inches. The mean diameter of the bore is .450 of an inch, and the rifling takes one complete turn in 22 inches. Its bullet is solid, with a slight cavity in the rear, and weighs 480 grains, the charge of powder being 85 grains. The range, accuracy, and penetration of the "Henry" barrel is nearly twice that of the present Enfield-Snider barrel, while the highest point of its trajectory at 500 yards is 2 ft. 9 in. lower, or 8 ft. $1\frac{1}{2}$ in. as compared with 11 ft. $10\frac{1}{4}$ in. The maximum range of the Henry barrel is 3,685 yards at an angle of $28^{\circ} 15'$.

As with small-arms, so with cannon, rifling is no new discovery. In the museum at St. Petersburg is a cannon which was rifled in nine grooves as early as 1615. In 1661 the Prussians experimented with a gun rifled in 13 shallow grooves. By 1696 the Germans had tried elliptical bores. From thence till 1833, many attempts were made to rifle cannon, with more or less success. In 1833 and 1836, M. Montigny of Brussels tried rifled guns with considerable success. In 1845 col. Cavalli of the Sardinian service commenced experiments with his rifled cannon: two Swedish officers—baron Warendorf and lieut. Engstrom—next produced rifled cannon; but none of these systems were permanently adopted. The Crimean war set inventors vigorously at work, and many admirable guns have resulted from their attempts, the great difficulty of the day being to decide which is most effectual. The first point was the metal; and here cast-iron was found quite useless, being incapable of resisting the explosion of the large charges necessary to force closely fitting projectiles through rifled barrels. Several plans were resorted to. Sir William Armstrong welds coils of wrought iron round a mandrel into one homogeneous mass of extraordinary tenacity, which he again strengthens by similar rings round the breech. Mr. Whitworth forces rings of wrought-iron over the barrel by hydraulic pressure; capt. Blakely strengthens a barrel of longitudinal bars welded together by sbrinking wrought-iron bands over it. The French rifle brass guns, and use small charges; having also guns of wrought-iron. The Austrians have made a new bronze alloy, which has proved extremely strong; the Belgians have tried Bessemer's steel. The system of rifling was the next important matter. Mr. Lancaster adhered to his oval bore; sir William Armstrong produced a bore rifled in a great number of small sharp grooves (this gun was adopted by the British government); Mr. Whitworth retained a hexagonal bore; and the French government adopted a bore with two, and subsequently three rather deep spiral grooves. After careful experiments, the Austrian, Spanish, Dutch, and Italian governments have concurred in the French system. In the Armstrong the rotation is communicated to the projectile by the latter being cased with lead, which the explosion forces into the grooves. The numerous fine grooves impart a very correct centering to the shot, and give extreme accuracy of range; but they render the gun a delicate weapon, and they preclude the occasional firing of round shot or canister, which would destroy the grooves. In the Whitworth the shot is constructed to pass freely through the spiral hexagonal bore, windage being prevented by a greased wad, which is said to foul the piece considerably. Lancaster's shot are elliptical, to correspond with the bore; they are simple and accurate; but there is some danger that they will jam in the gun, and cause it to burst. The French projectiles have ribs of projecting metal to correspond to the grooves, and are very effective, the system having the concomitant advantage of being able to fire ordinary shot without material injury to the gun. To sum up: the Armstrong gun is the most accurate, that and the Whitworth have the longest range, each having attained $5\frac{1}{2}$ m.; the Lancaster fouls least; the French is simplest, and can fire ordinary cannonballs, canister, or case.

The Armstrong gun was officially adopted into the British service in 1859, as the best weapon then known, but it has been superseded by an improved version known as the Woolwich gun.

The projectiles used with the various guns will be described under **SHELL** and **SHOT**.

RIFLEMEN are troops armed with rifles, and employed more or less as sharpshooters. The name has nearly lost all meaning, for the whole infantry are now riflemen; but a few years ago—i.e., as late as 1854, the riflemen were quite the exception, the army generally having the smooth-bore "Brown Bess." There were at that time only two line regiments of rifles, the 60th and the rifle brigade, with 2 colonial regiments of infantry (Canadian rifles and Ceylon rifles), and one Hottentot regiment of mounted infantry (the Cape mounted rifles). The establishment of rifle regiments was taught to the British by the Americans and French, from the sharpshooters of both of which nations our armies suffered severely. During the French war, the 60th and 95th regiments were armed as riflemen, taught light infantry drill, and clothed in dark green, to be as invisible as possible. The 95th became the rifle brigade. Experiment has since shown that gray is less conspicuous than green as a uniform, whence its adoption by many volunteer corps.

The volunteer riflemen of Great Britain will be described under **VOLUNTEERS**.

RIGA, a most important seaport of Russia, capital of Livonia, and the center of administration for the three Baltic provinces, Livonia, Esthonia, and Courland, stands mainly on the right bank of the Dwina. 5 m. from the mouth of that river, in the gulf of Riga. It is 376 m. s.w. of St. Petersburg, and is the terminus of a railway to Moscow, which again connects it with the Volga, and thus with the Caspian sea, bringing to Riga a considerable portion of the trade with the interior, and still more remote parts of Russia. A junction with the St. Petersburg and Berlin railway places this Baltic port in direct communication with the rest of Europe. From the steeple of St. Peter's church, said to be the highest in the empire, a full view of the situation of the city is obtained. Riga contains a number of striking and handsome public buildings, of which the castle, or dom, built in 1204, now the residence of the governor-general of the three Baltic provinces, is the chief. The Dwina is crossed by a bridge of boats, 800 paces long, of which the boats in the middle are movable, to allow of the passage of vessels, and which is entirely removed in winter. The old town is dark and gloomy, and shows all the main features of a German town of the middle ages; but the extensive suburbs are modern and handsome, and the whole is defended by ramparts, bastions, and other fortified works. Riga is the second trading town in Russia. It contains numerous soap, candle, glass, and iron works; cloth, leather, sugar, and tobacco factories, and rope-walks. Shipbuilding is extensively carried on in the town and vicinity. The principal articles of export are flax, hemp, linseed, corn, timber, tallow, and tobacco. In 1871 the exports amounted in value to £6,473,154; the imports, to £2,867,218. The total number of vessels which entered the port was 2,396, of tonnage 559,727, and the same number cleared it; of these, 580, measuring 227,425 tons, were British. Pop. '67, 102,043.

Riga was founded in the beginning of the 13th c. by Albert Buckshoevden, bishop of Livonia, and soon became a first-rate commercial town, and member of the Hanseatic league. The Teutonic knights possessed it in the 16th century. In 1621 Riga was taken by Gustavus Adolphus, and held under Swedish dominion till 1710, but was finally annexed to Russia in 1721.

RIGA, GULF OF, an inlet in the n.e. of the Baltic sea, washes the shores of the three Baltic provinces, Courland, Livonia, and Esthonia. It is over 100 m. in length from n. to s., and is about 70 m. in breadth. The islands of Oesel, Dagö, Mohn, and Worms stand in the entrance to it, and narrow the mouth of the gulf to a passage about 20 m. in width. The chief river which falls into the gulf is the Dwina. Sand-banks render navigation in some parts dangerous.

RIGDON, SIDNEY, 1793-1876; b. Penn.; received for publication while a printer at Pittsburg in 1812, a manuscript of a strange fiction in antique style, from Solomon Spaulding, a preacher noted for mental peculiarities, entitled *The Manuscript found, or The Book of Mormon*. He made a copy before returning it to Spaulding, who soon after died. In 1817 Rigdon left the printing office, became a preacher of peculiar doctrines similar to those which afterward appeared in the book of Mormon. In 1829 he became associated with Joseph Smith, and they arranged to publish the book of Mormon. When it appeared it was claimed by the widow as Spaulding's last work. Rigdon accompanied Smith to Kirtland, Ohio, to Missouri, and Nauvoo, where he was made one of the three presidents of the new church. After the death of Smith he aspired to succeed him as the head of the church, but Brigham Young was chosen. Rigdon refusing to acknowledge his authority was excommunicated for contumacy, returned to Pittsburg, where he died in obscurity.

RIGGING, in a ship, is a combination of very numerous ropes to afford stability to the masts, and to lower and hoist the sails. Notwithstanding the complication which the cordage of a rigged ship presents at first sight to the eye, the arrangement is remarkably simple. In all substantial points, the rig of each mast is the same; to understand one is, consequently, to understand all. In the accompanying diagram, spars are shown by capital letters; sails, by italic letters; *standing rigging*, by Roman numerals; and *running rigging*, by Arabic numerals. To avoid a confusing number of symbols and needless repetition, the corresponding ropes, etc., on each mast bear the same numbers, and in the key, the name of such rope *per se* is only given. To find the full title of a rope, it is necessary to prefix (unless it pertain to the bowsprit or gaff) the name of the mast (mizzen, main, or fore) to which it belongs. For example, the spars marked D are, counting from the left, i.e., the stern, called respectively mizzen-royal mast, main-royal-mast, and fore-royal-mast; the standing-ropes marked iv, are the mizzen-stay, main stay, and fore-stay; and the running-ropes bearing the figure 5, are mizzen-braces, main-braces, and fore-braces.

Rigging is either *standing* or *running*. The former is employed in maintaining, in fixed position, the masts and bowsprit; the latter runs freely through numerous blocks, and its functions are to raise and lower the upper masts and the yards, to trim the sails, to hoist the signals and other flags, and occasionally to furl the sails.

Each mast has the following standing rigging: at each side *shrouds* (i., ii., iii.), consisting of several very thick (usually plaited) ropes; in front, the *stay* (iv., v., vi., vii.); and behind, the *backstays* (viii., ix., x.), coming down to the ship's sides behind the

shrouds. Across the lowermast and topmast shrouds, thin ropes, called ratlings, are hitched horizontally, and form convenient ladders for the men to use in going aloft. The standing rigging of the lowermast reaches the chains on the ship's sides; while the shrouds of the topmast and topgallantmast are worked into the top, their stays to the tops of the mast nearer the bow in each case (the bowsprit serving as an anterior mast for the fore-rigging); all the backstays, however, are brought down to the ship's sides. In steamers, the mainstays require modification, in order to avoid the funnel; they are often adjusted on a plan similar to that of the backstays. The standing rigging of the bowsprit consists of the bobstays (xiv.), generally of chain; the martingale stays (xi., xii.), and martingale backstays (xiii.), which all exert an adverse pressure to that of the stays from the foremast, topmast, etc.

The *running* rigging is of four classes: 1. Lifts for the upper masts and the jib-boom. These are not shown in the diagram, from the fact that they run parallel, and closely contiguous to the masts, topmasts, and bowsprit.

2. The lifts for the yards and sails. Each yard has two lifts, one proceeding from a point near either extremity, and passing through a pulley at the head of that section of the mast to which the sail or yard belongs. They are worked either on the deck or in the top. The yard-lifts are shown by the numbers 1, 2, 3, 4. The gaff and boom have separate lifts working into the mizzen-top (13, 15). Each jib-sail has a lift (not shown,

Spars, etc.—A, mast; B, topmast; C, topgallantmast; D, royal-mast; E, yard; F, topsail-yard; G, topgallant-sail-yard; H, royal-yard; K, truck; L, bowsprit; M, jib-boom; N, flying jib-boom; O, martingale; P, chains; Q, top; R, cap; S, crosstrees; T, topmast cap; U, gaff; V, boom, or spanker-boom.

Sails.—a, mainsail; b, topsail; c, topgallant-sail; d, royal; e, spanker.

Standing Rigging.—i, shrouds; ii, topmast shrouds, crossed by ratlings; iii, topgallant shrouds; iv, stay; v, topmast stay; vi, topgallantmast stay; vii, royal stay; viii, topmast backstay; ix, topgallantmast backstay; x, royal backstay; xi, flying jib-boom martingale stays; xii, jib-boom martingale stays; xiii, martingale backstays; xiv, bobstays.

Running Rigging.—1, lifts; 2, topsail lifts; 3, topgallant-sail lifts; 4, royal lifts; 5, braces; 6, topsail braces; 7, topgallant braces; 8, royal braces; 9, signal halyards; 10, jib-stay; 11, flying jib-stay; 12, sheet; 13, peak halyards; 14, vangs; 15, topping lifts; 16, spanker sheet.

which acts parallel and close to iv., v., 10, or 11. If the ship carry stay-sails, there will be lifts parallel to the main and mizzen topmast stays and higher stays.

3. The ropes for adjusting the sails when spread. These comprise, first, the sheets for hauling down the lower corners of each sail—specimens are shown at 12; secondly, the braces for turning the yards about, to trim the sails to the wind. Each yard has two braces, one from either end passing to an adjoining mast, except the main braces, which are brought to the ship's side near the stern. The braces are shown as Nos. 5, 6, 7, 8. The vangs and spanker sheet (14, 16) perform similar offices for the spanker. There are

minor ropes in connection with the sails, for assisting in furling, reefing, spreading, etc. ; but it would have rendered the diagram too complicated to have inserted them

4. Ropes in connection with the flags. Each mast has at its head a *truck*, containing two or more small pulleys. Over each of these a thin halyard is passed, and brought down double to the deck. On these any required flag is rapidly bent and hoisted with great ease. There are two pair of similar halyards to the gaff-peak; and when the ship is to be decorated on any festive occasion, similar halyards are affixed to the end of each yard-arm.

In different classes of ships, slight modifications occur in the rigging, to suit particular circumstances, but the main principles of rigging are as detailed above for all sizes of decked vessels. See SAILS.

RIGGS, ELIAS, D.D., LL.D.; b. N. J., 1810; graduated at Amherst college in 1829, and Andover theological seminary in 1832; went the same year as a missionary of the American board to the east. He spent several years in Athens, Argos, and Smyrna; and has been since 1853 in Constantinople, except one year which he spent in New York, superintending the electrotyping of his Armenian translation of the Bible, when he also gave instruction in the Union theological seminary. He has translated the Bible into the Bulgarian tongue, and in 1878 completed the translation into the Turkish. Dr. Riggs is a proficient in many languages, the most of his work having been in modern Greek, Armenian, Bulgarian, and Turkish, of which he has published several manuals and grammars.

RIGGS, STEPHEN R., D.D., for many years a missionary to the Dakota Indians. He published a *Grammar and Dictionary of the Dakota Language*, which is regarded as a valuable contribution to American philology. He prepared also school-books for the Indians. With the aid of Dr. Williamson he translated most of the Bible into the Dakota language.

RIGHI, a mountain of Switzerland, in the canton of Schwyz, between lakes Lucerne, Zug, and Lowerz, is isolated, and commands extensive views of some of the finest Swiss scenery. It is easily accessible; six mule-paths and the Righi railway, opened in 1871, lead to the summit, which, though it forms an admirable natural observatory in favorable weather, is only 5,905 ft. above the sea. Verdant pastures clothe the entire summit, and the slopes are belted with forests. Crowds of tourists, of both sexes, ascend the Righi every season, in order to enjoy the fine views, which, in clear weather, it commands. There is a large hotel at the top where tourists pass the night in order to see the sun rise. The native spelling is *Rigi*.

RIGHT, in legal language, is that kind of interest or connection with a subject-matter which serves as a foundation for an action or suit, or other protection of a court of law or equity; and hence it means an interest that can be enforced, for if it is such as a court of law or equity cannot take notice of, it may be called a natural or moral, but it is not a legal right. Strictly speaking, right merely means a relation between external nature and some person or other, and therefore there is no such thing as abstract rights, for a right is only intelligible when predicated of some person who can exercise or enforce it. There is an old practical division of all rights into rights of the person and rights of things. In the former class are included such divisions as rights of personal security and liberty; rights connected with marriage, infancy, etc.; while in the latter class are included the general rights arising out of the possession of real and personal property. There are various subjects which do not fall under either division exclusively; indeed, many of the usual divisions of rights can be said to be more than vaguely descriptive of their subjects. It might naturally be expected that the correlative legal expression for rights should be wrongs, but this is not the case, the word wrong being used technically to mean only that class of infringements of one's rights which are connected with the person or the personal use of property. Thus, the refusing or withholding payment of a debt is not correctly called a legal wrong; but an assault or injury to one's person, or to one's property, irrespective of any contract, is properly called a wrong or a tort. The word right is also used, more or less technically, in a narrower sense. An action called a writ of right had for its object to establish the title to real property; but it was abolished, the same object being secured by the order of ejectment. A *petition of right* is a proceeding resembling an action by which a subject vindicates his rights against the crown, and recovers debts and claims, the first step being a petition, which is allowed by the home secretary, and referred for trial to a court of law. A *right of way* is a right of a private owner or occupier to a way over the land of an adjoining proprietor, as incidental to his possession of a house, or premises, or land. *Right of action* means simply a right to commence an action in one of the courts of law to recover damages or property. *Right of common* means a right of one who is not the owner or occupier of waste land, to send cattle to graze upon it, or to cut turf, or exercise some partial right of property over it. *Right of entry* is a right to possess and use land or premises, etc.

RIGHTS, DECLARATION AND BILL OF. The convention which called the prince and princess of Orange to the throne of England set forth, in a solemn instrument known by the name of the *Declaration of Rights*, those fundamental principles of the constitution which were to be imposed on William and Mary on their acceptance of the crown. This

declaration, drawn up by a committee of the commons, of which Mr. (afterward lord) Somers was chairman, and assented to by the lords, began by declaring that king James II. had committed certain acts contrary to the laws of the realm. The king, by whose authority these unlawful acts had been done, had abdicated the throne; and the prince of Orange having invited the estates of the realm to meet and deliberate on the security of religion, law, and freedom, the lords and commons had resolved to declare and assert the ancient rights and liberties of England. It was therefore declared that the power of suspending and of dispensing with laws by regal authority is illegal; that the commission for creating the late court of commissioners for ecclesiastical causes, and all commissions and courts of the like nature, are illegal; that the levying of money for the use of the crown by prerogative, without grant of parliament, is illegal; that it is the right of the subjects to petition the king, and all prosecutions for such petitioning are illegal; that the raising or keeping of a standing army in time of peace, except with consent of parliament, is illegal; that Protestant subjects may have arms for their defense; that the election of members of parliament should be free; that freedom of speech in parliament should not be questioned in any place out of parliament; that excessive bail ought not to be required, or excessive fines imposed, or cruel or unusual punishments inflicted; that jurors should be duly impaneled, and that jurors in trials for high treason should be freeholders; that grants and promises of fines and forfeitures before conviction are illegal; and that for redress of all grievances, and the amendment, strengthening, and preserving of the laws, parliaments ought to be held frequently. All these things the lords and commons claimed as their undoubted rights and liberties; and having done so, they resolved that William and Mary should be king and queen of England for their joint and separate lives, the administration being during their joint lives in William alone; and that on their decease the crown should descend to the issue of the queen, then to that of Anne and her posterity, and, failing them, to the issue of William.

This declaration of rights was presented to the prince and princess of Orange at Whitehall, and accepted by them along with the crown. Being originally a revolutionary instrument, drawn up in an irregular assembly, it was considered necessary that it should be turned into law. The declaration of rights was therefore brought forward in the parliament, into which the convention had been turned, as a bill of rights, and passed the commons; but an amendment proposed in the lords regarding the settlement of the crown on the issue of the princess Sophia, in the event of Mary, Anne, and William all dying without issue, led to several ineffectual conferences between the two houses, which ended in the measure being dropped. The bill was, however, reintroduced in the following session of parliament (1689) without the proposed amendment, when it passed both houses, and obtained the royal assent—a clause, however, being added, which originated in the house of lords, to the effect that the kings and queens of England should be obliged, on coming to the throne, in full parliament or at the coronation, to repeat and subscribe the declaration against transubstantiation, and that a king or queen who should marry a papist would be incapable of reigning in England, and his subjects would be absolved from their allegiance.

RIGHTS OF MAN, a famous statement of rights, principally drawn up by Dumont, author of the *Suvenirs de Mirabeau*, and solemnly adopted by the French national assembly on Aug. 18, 1789. It declares that all mankind are originally equal; that the ends of the social union are liberty, property, security, and resistance to oppression; that sovereignty resides in the nation, and that all power emanates from it; that freedom consists in doing everything which does not injure another; that law is the expression of the general will; that public burdens should be borne by all the members of the state in proportion to their fortunes; that the elective franchise should be extended to all; and that the exercise of natural rights has no other limit than their interference with the rights of others. Mirabeau endeavored in vain to induce the assembly to postpone publishing any declaration of rights until after the formation of the constitution; but the deputies, feeling that a contrary course might imperil their popularity, issued the declaration—a proceeding which Dumont himself afterward compared to placing a powder-magazine under a building, which the first spark of fire would blow into the air. Louis XVI., under the pressure of the events of Oct. 5, after first refusing, was induced to yield his adhesion to it. The dogma of the equality of mankind on which the declaration rests had before been set forth in the American declaration of independence of 1776. Thinkers are now much less inclined than they were in the age of Rousseau to build social theories on such abstract, *a priori* assumptions; and the truth of this doctrine of original equality is directly impugned. Dumont himself asks: "Are all men equal? Where is the equality? Is it in virtue, talents, fortune, industry, situation? Are they free by nature? So far from it, they are born in a state of complete dependence on others, from which they are long of being emancipated."

The principles laid down in the *Rights of Man* were attacked by Edmund Burke in his *Reflections on the French Revolution*, who represented the declaration as a digest of anarchy. It was in reply to Burke's *Reflections* that Thomas Paine published in London his *Rights of Man*, an apology for, and commentary on, the principles of the French constitution, for which he was prosecuted for libel on an information by the attorney-general, and found guilty.

RIGHT, THE, in French politics. See POLITICAL PARTIES, FRENCH.

RIGID DYNAMICS is that portion of theoretical dynamics (q.v.) which, based on the theory of the free and constrained motion of *points*, applies the principles thence deduced to a *system* of points rigidly connected, so as to bear throughout the whole continuance of their motion the same in variable position with relation to each other; in other words, as no body in nature can be considered as a point, but is truly a system of points, rigid dynamics has for its aim to apply the abstract theory of dynamics to the cases actually occurring in nature. For a long time problems of this sort were not resolved by any general and adequate method, but each class was worked out according to a method specially applicable to its particular circumstances. The great general principle discovered by the French geometer, commonly known as *D'Alembert's principle*, which applies equally to all such problems, and removes the necessity for specially investigating each particular case, was an inestimable boon to mechanical science. It is thus stated in his *Traité de Dynamique*: "In whatever manner a number of bodies change their motions, if we suppose that the motion which each body would have in the following moment, if it were perfectly free, is decomposed into two others, one of which is the motion which it *really* takes in consequence of their mutual actions, then the other component will be such, that if each body were impressed by a force which would produce it alone, the whole system would be in equilibrium. In this way every dynamical problem can be compelled to furnish an equation of equilibrium, and so be changed into a problem of *statics* (q.v.); and thus the solution of a difficult and complex problem is effected by means of the resolution of a much easier one. D'Alembert applied his principle to various problems on the motions and actions of fluids, the precession of the equinoxes, etc.; and subsequently, in a modified form, the same general property was made the basis of a complete system of dynamics, by La Grange, in his *Mécanique Analytique*.

RIGOR MORTIS is the term usually given to the peculiar temporary rigidity of the muscles that occurs shortly after death. It begins immediately after all indications of irritability (see **MUSCLE**) have ceased, but before the commencement of putrefaction. In the human subject it most commonly begins to show itself about seven hours after death, although cases are occasionally met with in which 20 or even 30 hours may have elapsed before it begins to appear. This condition of rigidity usually lasts for about 30 hours; but it may pass off in 10 hours or less, or may be prolonged to four or six days. The muscles of the neck and lower jaw are first affected, then those of the trunk, then those of the upper extremities, and lastly those of the lower extremities. In its departure, which is immediately followed by decomposition, the same order is followed.

This subject has been admirably discussed by Dr. Brown-Sequard in the "Croonian Lecture" for 1861, and contained in *The Proceedings of the Royal Society* for that year. In this lecture he examines successively the relations existing between muscular irritability, *post-mortem* rigidity, and putrefaction, in a variety of cases. The following are his chief conclusions: 1. Paralyzed muscles are endowed with more irritability than healthy muscles; cadaveric rigidity sets in late, and lasts long; and putrefaction appears late, and progresses slowly. 2. Experiments made on numerous animals show that when muscular irritability is increased by a diminution of temperature, the increase has the same effect upon rigidity and putrefaction as when it is caused by paralysis. As a general rule, when there was a difference of 14° to 18° Fahr. in the temperature of two animals of the same age and species, irritability and rigidity lasted twice or three times longer in the cooler animal than in the other, and putrefaction in the former was much less rapid. 3. It was maintained by John Hunter that cadaveric rigidity does not take place after death by lightning; but it is now known that this view is not generally true. When lightning destroys life by producing such a violent convulsion of every muscle in the body that muscular irritability at once ceases, the ensuing rigidity may be of such short duration as to escape notice; but if it causes death by fright, hemorrhage, or concussion of the brain, cadaveric rigidity will appear as usual. 4. In animals that have been over-driven, hunted to death, etc., rigidity comes on very quickly, lasts for a very short time, and is rapidly succeeded by putrefaction; and various facts quoted by Brown-Sequard show that over-exertion acts similarly in man. 5. The nutrition of the muscles exerts a modifying influence on rigidity and putrefaction. In cases of death from decapitation, strangulation, sudden hemorrhage from a wounded artery, etc., cadaveric rigidity does not begin till 16 or 18 hours after death, and lasts from six to eight days; while in a case of death from exhaustion, after a prolonged typhoid fever, rigidity became evident within three minutes after the last breathing, while the heart was still beating; disappeared in a quarter of an hour, and was at once succeeded by signs of putrefaction before the man had been dead an hour. 6. When death follows violent and prolonged convulsions (as in cases of tetanus, hydrophobia, etc.), cadaveric rigidity sets in soon (usually within an hour after death), and ceases before the end of the tenth hour; and when the convulsions were caused by strychnine, similar results were obtained.

From these facts this accomplished physiologist deduces the general law that "the greater the degree of muscular irritability at the time of death, the later the cadaveric rigidity sets in; and the longer it lasts, the later also putrefaction appears, and the slower it progresses."

The exact cause of this rigidity is not accurately known. The old view that it

depended on the coagulation of the blood is no longer tenable. It most probably results from the spontaneous coagulation of a fibrinous material contained in the muscular juice.

RIG-VEDA, the first and principal of the four Vedas. See VEDA.

RILEY, a co. in n.e. central Kansas, drained by the Kansas, Republican, and Big Blue rivers; traversed by the Kansas Pacific railroad; about 575 sq. m.; pop. '80, 10,430—8,319 of American birth. The surface is rolling prairie or woodland. The soil is fertile. The principal productions are corn, wheat, oats, and live stock. Co. seat, Manhattan.

RILEY, BENNET, 1783-1852; b. Baltimore; entered the army and took part in several engagements with the Indians. He served through the Mexican war, and was appointed brevet maj.gen. for his conduct at Contreras. He was commander of the department of Upper California, 1849-50.

RILEY, CHARLES VALENTINE, b. London, 1843; came to this country at the age of 17, engaged in farming at the west for 3 years, was entomological editor of the *Prairie Farmer*, in Chicago, 1863-68. In the latter year he was appointed state entomologist of Missouri; and associated with B. D. Walsh, state entomologist of Illinois, began the publication of *The American Entomologist*, a monthly magazine. He has made valuable discoveries in relation to the anatomy and habits of potato beetles, cicadas, locusts, yuccas, and army worms, which, with practical suggestions on grape culture, received with favor in this country and in France, have appeared in his annual reports.

RIMA-SZOMBATH, a market t. of Hungary, on the river Rima, 23 m. n.e. of Pesth. Articles in wood are largely manufactured, and there is a trade in linen and bullocks' hides. Pop. '69, 4,664.

RIMINI (ancient *Ariminum*), a city of central Italy, province of Forli, in Romagna. It is situated on the river Marecchia, and though the ancient harbor has been gradually filled up by the sands brought down by that stream, the port is still the resort of a large number of vessels engaged in fisheries, which employ nearly half the population of the town. Pop. '71, 10,600. Rimini has fine streets, well-built houses, a handsome town-hall with porticoes, many fine churches, among others the cathedral built by Leon Battista Alberti, the interior of which is full of monuments; outside it is adorned with sarcophagi. It has a library, many superior schools, and two orphan asylums. Among its ancient monumental edifices still remaining, may be numbered the marble bridge of Augustus over the Marecchia, and the marble arch of Augustus. Its manufactures are glass and sail-cloth. Rimini was founded by the Umbri; it was conquered by the Romans, sacked by Sulla, frequently destroyed by the barbarians, then given by Charlemagne to the church.

RIMOUSKI, a co. in n.e. Quebec, having the province of New Brunswick on the s., and the river St. Lawrence for its w. and n.w. boundary; 4,931 sq. m.; pop. '71, 27,418. It is intersected by the Grand Trunk railway. Its surface is covered with a dense growth of timber. It is drained by the Metapediac, a lake of the same name, the river Mitis and Mitis lake, the river Rimouski, and Tartigo river, emptying into the Restigouche and the St. Lawrence. Co. seat, Rimouski.

RINDERPEST. See CATTLE-PLAGUE.

RINEHART, WILLIAM HENRY, 1825-75; b. Md.; received a common school education, and became a journeyman marble-worker. His taste for sculpture was marked; by hard work and without instruction he acquired some skill in modeling, and in 1855 visited Florence, Italy, where he studied art for two years. On his return to Baltimore, 1857, he exhibited two *bas-reliefs*, "Night" and "Morning," which attracted much attention. In 1858 he returned to Italy, and the rest of his life was spent in Rome, where he soon took his place as one of the foremost American sculptors. He completed the modeling of the bronze doors of the capitol, made many portrait busts, and a bronze statue of chief-justice Taney for the state of Maryland. Among other works were his "Angel of the Resurrection," "Jesus," "Woman of Samaria," and "Sleeping Children." Of the last several *replicas* were ordered. His best work is "Clytie just forsaken by Apollo." This is now the property of the Peabody institute of Baltimore.

RINFORZAN DO (Ital., strengthening), in music, a direction to the performer indicating increased tone and emphasis.

RING (Sax. *ring*, a circle or circular line), a circle of gold or other material. The practice of wearing rings has been widely prevalent in different countries, and at different periods. Rings have been used to decorate the legs, arms, feet, toes, neck, fingers, nose, and ears. The practice of wearing rings suspended from the nose, which it bored for that purpose, has been found among various savage tribes, more particularly the South-sea islanders. Bracelets, necklaces, and ear rings have been worn among nations both savage and civilized; but the most universal and most famous use of rings is on the finger. Finger-rings are alluded to in the books of Genesis and Exodus; Herodotus mentions that the Babylonians wore them; and from Asia they were probably introduced into Greece. The rings worn in early times were not purely ornamental, but had their use as signet-rings. The Homeric poems make no mention of rings, except ear-

rings; but in the later Greek legends, the ancient heroes are described as wearing finger-rings; and every freeman throughout Greece seems afterwards to have had one. The practice of counterfeiting signet-rings is alluded to as existing in Solon's time. The devices on the earlier rings were probably cut in the gold; but at a later period, the Greeks came to have rings set with precious stones, which by and by passed from articles of use into the category of ornament. Persons were no longer satisfied with one ring, but wore two or three—and their use was extended to women. The Lacedæmonians wore iron rings. The Romans are said to have derived the use of rings from the Sabines; their rings were at first, as those of the Greeks, signet-rings, but made of iron. Every free Roman had a right to wear one; and down to the close of the republic, the iron ring was worn by those who affected the simplicity of old times. Ambassadors, in the early age of the republic, wore gold rings as a part of their official dress—a custom afterward extended to senators, chief magistrates, and in later times to the equites, who were said to enjoy the *jus annuli aurei*, from which other persons were excluded. It became customary for the emperors to confer the *jus annuli aurei* on whom they pleased, and the privilege grew gradually more and more extensive, till Justinian embraced within it all citizens of the empire, whether *ingenui* or *libertini*. The signs engraved on rings were very various, including portraits of friends or ancestors, and subjects connected with mythology or religion; and in the art of engraving figures on gems, the ancients far surpassed artists of modern times. The later Romans, like the Greeks, crowded their fingers with rings, and the more effeminate among them sometimes had a different ring for summer and winter. Rings entered into the groundwork of many oriental superstitions, as the legend of Solomon's ring, which, among its other marvels, sealed up the refractory Jins in jars and cast them into the Red sea. The Greeks mention various rings endowed with magic power, as that of Gyges, which rendered him invisible when its stone was turned inward; and the ring of Polycrates, which was flung into the sea to propitiate Nemesis, and found by its owner inside a fish; and there were persons who made a lucrative traffic of selling charmed rings, worn for the most part by the lower classes.

Various explanations have been given of the connection of the ring with marriage. It would rather appear that wedding-rings were worn by the Jews prior to Christian times. It has been said that as the delivery of the signet-ring to any one was a sign of confidence, so the delivery of a ring by the husband to the wife indicated that she was admitted into his confidence. Another explanation is, that the form of the ring symbolizes eternity and constancy; and it has been alleged that the left hand was chosen to denote the wife's subjection to her husband, and the third finger, because it thereby pressed a vein which was supposed to communicate directly with the heart. The third finger has always been selected as the finger on which official rings are to be worn. Bishops on their consecration receive a ring to be worn on the third finger of the right hand, in order to indicate ecclesiastical authority, and doctors were formerly in use, for a similar reason, to wear a ring on the same finger. A ring has been much used at betrothal as well as marriage, and in many parts of the continent of Europe a wedding-ring is worn by the husband as well as the wife. In Britain rings are occasionally worn on all the fingers except the first finger and thumb; the Germans usually wear a signet-ring on the first finger. During the 16th, 17th, and 18th centuries it was a very common practice to have mottoes inscribed on rings, including wedding-rings, and the motto was called the *posy* or *chanson*. The ring was the symbol of the dominion of Venice over the Adriatic; and yearly, on ascension day, a ring was thrown by the doge from the ship *Bucentaur* into the sea, to denote that as the wife is subject to her husband, so is the Adriatic sea to the republic of Venice.

In pagan times in Europe, the ring seems to have been connected with fidelity or with espousals. A form of betrothal ring called a *gimmel*, or linked ring, was used in later times. By an ancient Norse custom, described in the *Eybyggja Saga*, when an oath was imposed, he by whom it was pledged passed his hand through a silver ring, sacred to that ceremony; and in Iceland the ceremony of betrothal used to be accompanied by the bridegroom passing his four fingers and thumb through a large ring, and in this manner receiving the hand of the bride, as represented in a woodcut in an old edition of *Olaus Magnus*. As lately as 1780 the practice existed in Orkney of a man and woman plighting their faith at the standing stones of Stennis by joining their hands through the perforated stone of O. lin.

Rings were greatly used in ancient Egypt. They were called *tebb*, finger-rings, and *khatem*, signets, both kinds being represented in the sculptures and mentioned in the hieroglyphs. Besides these two classes, solid rings of gold and silver were used as money. Rings for the fingers are of the most remote antiquity, and were the emblems of rank and power. They were of two kinds; the solid ring, made of gold, silver, copper, or iron, having a square or oval bezel, on which the subject to be impressed was sunk or cut in intaglio. The oldest of these were of gold, iron not having been in use till the Roman rule over Egypt, or about the 1st c. A. D. A remarkably fine specimen is one of a Hemphite priest or flamea of the monarch Cheops, who lived in the time of the 26th dynasty, about the 5th c. B. C. But rings of this class are probably not so old as the other kind, which have a square or oblong plinth of gold, stone, or glass, on which the subjects are engraved also in intaglio. These plinths are pierced through their long

axis to admit the metal ring on which they revolve, and are secured to it by wire coiled round the ring at the place of insertion. Scarabæi of glazed steatite, set in frames of gold or silver, were often used for bezels. The bezels have their base engraved with hieroglyphs and other subjects, the names of monarchs, figures of deities, mottoes, and devices. Such rings were used by functionaries; and in the account of the investiture of Joseph in the book of Genesis, a ring was put on his finger as a symbol of his rank. The poorer classes had rings of ivory or blue porcelain, with solid oval bezels, having in intaglio similar subjects. Rings appear to have been placed on all the fingers, and even the thumb, and the hands of ladies were loaded with these costly ornaments. A cat, emblem of the goddess Bast or Pasht, the Egyptian Diana, was a favorite subject of ladies' rings. The third finger of the left hand was the ring finger. Some remarkable instances of gold rings with revolving bezels have been found, as that of Thothmes III. in the collection of lord Ashburnham, and another with the name of the monarch Horus, which contained gold to the value of £20. Such rings could give two impressions, like the seal and counter-seal of modern times.—Wilkinson, *Mann. and Cust.*, vol. iii. pp. 370 and foll.; Bonomi, *Trans. R. Soc. Lit.*, new series, vol. i. p. 108; Prisse, *Mon. Egypt.*, Pl. xlvi.; also *Antique Gems and Rings*, by King, 2 vols. 1872; *Ring Ring Love*, by William Jones, F.S.A., 1876.

RING, MELCHIOR, a prominent Anabaptist leader in Hesse in the time of the reformation; first a school-teacher and chaplain at Hersfeld. Having become a disciple of Thomas Münzer, he went to Sweden in 1524 with Hoffmann and Knipperdolling, and by his fanatical sermons excited in Stockholm a riot against images. He returned to Germany to take part in the "peasant's war," and, after a bloody catastrophe, fled to Switzerland, which he was compelled to leave on account of a murder committed as an act of religion by one of his followers. He attacked Luther and the evangelical preachers. Finally he fled to East Friesland; went to Hesse and Saxony, where he was frequently imprisoned. He died in connection with the Münster revolt.

RING-BONES consist of a circle of bony matter round the horse's coronet, are most common in the fore-limbs of draught horses with short upright pasterns, and much worked upon the hard roads; but they also occasionally appear on the hind limbs of lighter-bred horses. They seldom cause lameness, except when rapidly and recently formed; but as they are apt to stiffen the neighboring joints, they constitute unsoundness. Rest should be enjoined, and cold bran poultices or swabs, kept cool and moist by any refrigerant mixture, applied continuously until heat and tenderness are removed, when the fetlock is to be fired or dressed with fly-blister, or the ointment of the red iodide of mercury.

RINGDOVE. See PIGEON.

RINGGOLD, a co. in s. Iowa, adjoining Missouri, drained by the Platte and some of the branches of the Grand river; about 560 sq. m.; pop. '80, 12,085—11,492 of American birth. The surface is rolling. The soil is fertile. The principal productions are wheat, corn, oats, and live stock. Co. seat, Mount Ayr.

RINGGOLD, CADWALADER, 1802-67; b. Md.; son of gen. Samuel; entered the navy as midshipman 1819; rose through successive grades to rear-admiral, 1867. As commander he went on an exploring expedition to the n. Pacific and China sea. At the commencement of the rebellion he was engaged in the s. blockade squadron, commanding the frigate *Sabine*, operating against Port Royal, etc. He retired 1864. He published a *Series of Charts with Sailing Directions*, 4th ed. Washington, 1853.

RINGKJÖBING-FJORD, a lagoon on the n. coast of Jutland, Denmark, about 30 m. long and 9 wide, separated from the North sea by a long sandy strip. The town of Ringkjöbing is on its n.e. shore.

RING MONEY. At an early stage of society, prior to the invention of coinage, but after the inconveniences of direct barter had been discovered, the precious metals, formed into rings, were used as a medium of exchange; these same rings being also serviceable in some cases as personal ornaments. The use of ring money among the Egyptians is proved by representations of gold and silver money in their paintings, an instance of which is to be seen in one of the grottoes in the hill of Shek Aba at Quornch, which bears the cartouche of Amunoph II. inscribed on its walls. The gold or silver rings were formed of a wire or bar of metal bent into a circle, but not quite united at the extremities, so that it could be easily made into a chain, from which portions could be detached at pleasure. It seems probable that the individual loops were not adjusted to a particular weight, but that each bundle of loops amounted in the aggregate to a particular weight. A metallic currency of this kind seems to be alluded to in the incident in the book of Genesis, of the Hebrew patriarchs finding their money "in full weight" at the mouth of their sacks. Ring money, both of gold and silver, similar to what is represented in the Egyptian paintings, was brought by Mr. Bonomi from Nubia. Some of the silver rings had been worn as bracelets, and were ornamented with engraved work. This kind of currency has probably never gone out of use in some parts of Africa since the remote period when it was employed in paying the exactions of the Pharaohs. Ring money for African traders is regularly manufactured at Birming-

ham of copper, or an alloy of copper and iron, and known under the name of "Mallias."

The ring money of the east found its way at an early period to western Europe, including the British islands. In Sweden and Norway its use seems to have continued down to the 12th c., or even later. A Norse law made about the year 1220 alludes to an established ring money, of which each ring was of a definite weight. The mediæval ring money had so far advanced beyond the Egyptian as to have each ring adjusted to a special weight, for which it might pass without weighing. Cæsar mentions gold and iron rings as used in Gaul and Britain for money; and gold and silver, and occasionally brass, ring money has been dug up in many parts of Britain, consisting of bars of metal bent in a circular shape; the ends in what seem to be the older specimens are left plain; in those of later times they are flattened and ornamented. One example, found in one of the *Weems*, or subterranean dwellings of the island of Shapins-hay in Orkney, is composed of three bars of gold twisted together like a cord. A remarkable silver chain of 33 rings, weighing above 93 ounces, was dug up in 1805 near Inverness, in the course of the excavations for the Caledonian canal, and is now in the museum of the Scottish antiquaries. Some of the larger specimens of gold ring money are very highly decorated. The gold torque worn round the neck of the Gallic warriors, weighing sometimes as much as four pounds, besides being a personal ornament, was adjusted to a certain weight as money.

Among the various modifications of ring money in use in different countries, may be mentioned the silver fish-hook money of Ceylon, mentioned by Tavernier, of the form of a flat wire bent into a hook, and issued as late as 1659. Specimens of it have lately been dug up.

RING-OUZEL, *Turdus torquatus*, or *Merula torquata*, a species of thrush, rather larger than the blackbird, which it much resembles. It is a native of Europe, and chiefly of the western parts of it; spends the winter in the s. of Europe or in Africa, and visits more northern regions in summer. It is of frequent occurrence in many parts of the British islands. It is seldom seen in the more cultivated and thickly peopled districts, but prefers mountain slopes, heaths, and their vicinity. It makes its nest generally in heathy banks, often under a bush. The nest is of coarse grass, within which is a thin shell of clay, and an inner lining of fine dry grass. The ring-ouzel is a constant visitor of gardens in the neighborhood of its haunts, committing great depredations, particularly when cherries are ripening. In Scotland it is known as the *moor blackbird*. It is of a dark brown color, almost black; the feathers edged with blackish-gray, the feathers of the wings more conspicuously edged with gray; a crescent-shaped white collar on the throat. The song consists of a few loud, clear, and plaintive notes.

RINGWORM is a popular term for several distinct forms of skin-disease which occur in patches of a circular or annular form on the body, and especially on the scalp. Thus, a species of lichen (q.v.), known to dermatologists as *lichen circumscriptus*, in which the papules assume a circular arrangement, is commonly regarded as ringworm; and the two species of herpes (q.v.), known as *herpes circinatus* and *H. iris*, in which the vesicles occur in circular patches and in concentric rings, are usually included in the same term. None of these are, however, cases of true ringworm (*tinea tonsurans*), which is a disease dependent on the presence of a special vegetable (fungus) parasite, now known to botanists as the *trichophyton tonsurans*, or hair-plant, and discovered in 1845 by Malmsten. It consists of oval transparent spores or globules, about $\frac{1}{100}$ of an in. in diameter, for the most part isolated, but sometimes connected by articulated filaments. This fungus is seated in the interior of the hair-roots, and the hairs and the fungi simultaneously increase in size. The diseased hairs lose their elasticity and break when they have risen a line or two above the scalp. In these cases the short stump of hair soon loses all its characteristics. If the hair breaks before emerging from the scalp, a little prominence is formed, consisting of fungus, epidermis and sebaceous matter, and the assemblage of such little prominences gives the scalp the rough appearance known as goose-skin. This parasite exists, according to Dr. Aitken—whose *Science and Practice of Medicine* contains an excellent abstract of all that is known regarding parasitic diseases—"in the herpes tonsurans of Cazenave, which is the *porrigo scutulata* of Willan, the *tinea tonsurans* of Bazin, and the *trichosis furfurans* of Erasmus Wilson and Dr. Wood." There are three varieties of true ringworm, which are described by Aitken under the following names: 1. Ringworm of the body (*tinea circinatus*); 2. Ringworm of the scalp (*tinea tonsurans*); and 3. Ringworm of the beard (*tinea sycosis*).

1. *Ringworm of the body* first appears as a rose-colored and slightly elevated spot about the size of a fourpenny-piece, on which a bran-like desquamation of epidermis soon begins, accompanied by slight itching. This spot gradually increases in size, but retains its circular form; and as it extends, the healing process commences at the center, so that the circular red patch is converted into a ring, inclosing a portion of healthy skin; and a ring thus formed may continue to increase till it reaches a diameter of four in., or even more. It is apt to affect the face, the neck, the back, and the outside of the wrist. This form of ringworm frequently terminates spontaneously.

2. *Ringworm of the scalp* usually occurs in children, and is especially prevalent when the nutrition is defective, or there is a scrofulous taint in the constitution. It appears in

the form of round, scaly, irritable patches on different parts of the head; and the irritation often occasions the formation of minute vesicles. The hairs at these spots become dry and twisted, and are easily extracted; and when the disease advances, they break close to the scalp if an attempt is made to extract them. The stumps, and the epidermis surrounding them, become covered with a characteristic grayish-white powder, consisting of the sporules of the fungus. The diseased parts are slightly elevated and puffy, and differ from the healthy scalp in color, being bluish or slate-colored in dark persons, and grayish-red or yellow in fair patients. The inflammation will last as long as the growth of the fungi continues; and even when they die spontaneously, as sometimes occurs, the affected spots remain permanently bald, in consequence of the hair-bulbs having become obliterated.

3. *Ringworm of the beard* is chiefly met with on the chin, hairy part of the cheeks, and upper lips of men; but it occasionally attacks the axillæ and pubic region of women. It commences like ringworm of the body, but when the deeper structures become affected, pustular indurations, resembling acne (q. v.), occur, and the hairs become readily detached. On examining the hairs under the microscope, it is seen that they are thickened; that their bulbs are partially disorganized; and that the medullary portion is atrophied.

The essential point in the treatment of all the varieties of true ringworm is to apply to the roots of the hairs a preparation which will destroy the fungus; but before this can be done the hair must be removed, if the disease has not already effected the removal sufficiently. This is best effected with small pincers about 3 in. long, and constructed so that the two extremities, which should be a couple of lines broad, shall come together very exactly. Or, in place of using the forceps, an ointment, composed of lime and carbonate of soda, of each 1 part, and 30 parts of lard, may be applied, which will soon remove the hair. French dermatologists recommend the application of "l'huile de cade," or "oil of pitch," obtained by the dry distillation of the wood of the *Juniperus oxycedrus*, to the part from which the hairs are to be removed, believing that it lessens the sensibility, and tends to loosen the attachment of the hair. In order to destroy and remove the plant, lint dipped in a solution of sulphurous acid should be continuously applied—sulphurous acid being probably the most energetic parasiticide at present known. Among the solutions that have been applied with the same object, may be mentioned that of corrosive sublimate, 1 part to 250 of water. The general health must be at the same time attended to, and the internal use of cod-liver oil may usually be advantageously combined with the local applications.

Ringworm in the lower animals, as in the human subject, consists of the growth of a vegetable fungus on the surface of the skin, is common amongst young animals, is decidedly contagious, and communicable from man to the lower animals, and probably, also, from the lower animals to man. Commencing with a small itchy spot, usually about the head or neck, or root of the tail, it soon spreads, producing numbers of scurfy circular bald patches. It is unaccompanied by fever, and seldom interferes seriously with health. After washing with soap and water, run over the spots lightly every day with a pencil of nitrate of silver, or rub in a little of the red ointment of mercury, or some iodide of sulphur liniment.

RINNS OF GALLOWAY. See WIGTONSHIRE.

RIO ARRIBA, a co. in n.w. New Mexico; drained by the Rio Grande del Norte and its branches; pop. 70, 9,294. The surface is varied, in great part mountainous; corn, grass, and wool are the staples; cattle raising is carried on. Co. seat, Plaza del Alcalde.

RIOBAMBA, a t. of Ecuador, 100 m. s. from Quito, situated among the Andes, on an affluent of the Pastaza, a large branch of the Amazon. It is sometimes called New Riobamba, having been built instead of a former town of the same name, which was destroyed by an earthquake in 1797, and the ruins of which are 9 m. distant, at the foot of Chimborazo. Pop. about 16,000, in great part consisting of Indians.

RIO BRANCO, a river of Brazil, the largest affluent of the Rio Negro, rises near the sources of the Orinoco, in lat. about 3° n., long. about 64° west. It flows first e. to long. 61° w., and then s.s.w. to the Rio Negro, which it joins after a course estimated at 700 m. in length. At its junction with the Negro it is upward of a mile in breadth, and its lower course resembles a string of lakes connected by narrow canals. Its navigation is much impeded by rapids and waterfalls.

RIO BRAVO DEL NORTE, or RIO GRANDE. See BRAVO DEL NORTE.

RIO DE JANEIRO, a maritime province in the s.e. of Brazil, bounded on the s. and e. by the Atlantic. Area, 26,530 sq.m.; pop., without the city, 72, 782,724. The coast on the n.e. is low and lined with lagoons; but in the s. the scenery of the shores is unusually beautiful. Mountain ranges occupy the middle of the province, among which the peaks of the Organ mountains, rising to from 6,000 to 7,000 feet, are conspicuous. Of the rivers the Parahiba is the chief. The soil is fertile, and the principal productions are sugar, coffee, cocoa, cotton, rice, and maize. The province is traversed by a railway. The capital is Praia Grande, or Netherohy, which, including the district of

St. Domingo, contains about 25,000 inhabitants. The largest and most important town, however, is Rio de Janeiro (q.v.).

RIO DE JANEIRO, generally called Rio, the capital of the Brazilian empire, and the largest and most important commercial emporium of South America, stands on a magnificent harbor, 75 m. w. of cape Frio, in lat. 22° 54' s., long. 43° 15' west. The harbor or bay of Rio de Janeiro, said, and apparently with justice, to be the most beautiful, secure, and spacious bay in the world, is landlocked, being entered from the s. by a passage about a mile in width. It extends inland 17 m., and has an extreme breadth of about 12 miles. Of its numerous islands, the largest, Governor's island, is 6 m. long. The entrance of the bay, guarded on either side by granite mountains, is deep, and is so safe that the harbor is made without the aid of pilots. On the left of the entrance rises the peak called, from its peculiar shape, Sugar-loaf mountain; and all round the bay the blue waters are girdled with mountains and lofty hills of every variety of picturesque and fantastic outline. The harbor is protected by a number of fortresses. The city stands on the w. shore of the bay, about 4 m. from its mouth. Seven green and mound-like hills diversify its site; and the white-walled and vermilion-roofed houses cluster in the intervening valleys, and climb the eminences in long lines. From the central portion of the city, lines of houses extend 4 m. in three principal directions. The old town, nearest the bay, is laid out in squares; the streets cross at right angles, are narrow, and are paved and flagged; and the houses, often built of granite, are commonly two stories high. West of it is the elegantly built new town; and the two districts are separated by the Campo de Santa Anna, an immense square or park, on different parts of which stand an extensive garrison, the town-hall, the national museum, the palace of the senate, the foreign office, a large opera-house, etc. From a number of springs which arise on and around mount Coreovado (3,000 ft. high, and situated 3½ m. s.s.w. of the city), water is conveyed to Rio de Janeiro by a splendid aqueduct, and supplies the fountains with which the numerous squares are furnished. Great municipal improvements have within recent years been introduced; most of the streets are now as well paved as those of the finest European capitals; the city is abundantly lighted with gas; and commodious wharfs and quays are built along the water edge. Rio de Janeiro contains several excellent hospitals and infirmaries, asylums for foundlings and female orphans, and other charitable institutions, some richly endowed; about 50 chapels and churches, generally costly and imposing structures, with rich internal decorations, and several convents and nunneries. In the college of Pedro II., founded in 1837, the various branches of a liberal education are efficiently taught by a staff of 8 or 9 professors; the Imperial academy of medicine, with a full corps of professors, is attended by upward of 300 students; there is also a theological seminary. The national library contains 100,000 vols. The trade and commerce of Rio de Janeiro is great, and is annually increasing. In 1872-73 the value of exports from Rio de Janeiro was £10,528,655, consisting of coffee, £9,609,745; gold in bars and dust, £421,690; diamonds, £117,480; tobacco, £104,400; hides, £96,816; cotton, £81,696; timber, £55,000; sugar, £26,710; rum, £13,750; horse-hair, india-rubber, and wool, £1300. In 1875-76 the shipments of coffee alone amounted to £8,891,138. The value of imports, consisting of silk, linen, cotton, and woolen goods, iron, etc., was £9,000,000 in 1877. In 1877, 3,411 foreign vessels, of 1,657,452 tons, entered and cleared the port. Steam communication with other ports of Brazil is frequent; European steamships arrive and depart almost daily, and there is telegraphic connection with Europe. The capital and its environs are served by two railways and 8 different lines of tramway. Pop. '72, 274,972.

The vicinity of Rio de Janeiro was first settled by the French in 1555, but was occupied in 1567 by the Portuguese, who founded the present city, and gave to it the name of St. Sebastian. For the space of 140 years after its foundation, the city enjoyed a state of tranquil prosperity, and in 1763 it superseded Bahia as the seat of government, and became the residence of the viceroys of Portugal. On the proclamation of independence in 1822 (see BRAZIL), Rio de Janeiro became the capital of the Brazilian empire.

RIO GRANDE, a name sometimes applied to the upper course of the river Parana (q.v.) in Brazil.

RIO GRANDE, a river of Senegambia (q.v.).

RIO GRANDE, or **RIO GRANDE DEL NORTE**. See BRAVO DEL NORTE.

RIO GRANDE, river in Bolivia. See GUAPEY, *ante*.

RIO GRANDE, a co. in s. Colorado; drained by the Rio Grande river and its creeks; pop. '80, 1944—1664 of American birth. The surface is traversed by the San Juan range, of which the highest peak, Pintada, is over 13,000 ft. high. The San Juan gold mines are very rich. Co. seat, Del Norte.

RIO GRANDE DO NORTE, a small maritime province of Brazil, occupies the n.e. angle of the country, and is bounded on the n. and e. by the Atlantic. Area, 22,000 sq.m.; pop. '72, 233,979. It derives its name from a river, formerly called the Rio Grande, and now called the Potengi, which flows into the Atlantic at Natal; but the principal river is the Piranhas. The surface is flat along the shores, which are skirted by many dangerous shoals, but is hilly and mountainous in the interior. Salt is obtained in large quan-

tity from a number of salt lakes, and building-stone is abundant. The soil, generally sterile, is fertile on the river-banks. The principal crop raised is cotton, and large herds of horses and cattle are reared on the pastures, which are extensive. Cotton to the value of £77,000 was exported in 1873. The capital is Natal (q.v.).

RIO GRANDE DO SUL, or, to give the name in full, **SÃO PEDRO DO RIO GRANDE DO SUL**, a maritime province of Brazil, constituting the extreme s. portion of the empire of that name. It is bounded on the n. and w. by the river Uruguay, on the s.w. by the republic of Uruguay, and on the s.e. by the Atlantic. Area, 85,239 sq. m.; pop. 72, about 455,000. The central districts are occupied by a range of mountains, which runs almost parallel to the Uruguay, and from which the land falls away into plains toward the Uruguay on the w., and the Atlantic on the east. Between the mountains and the flat coast regions are the large lakes Merim and Des Patos—the latter, 175 m. long and about 40 m. broad. Its salubrity of climate and fertility of soil admirably adapt it for European immigration. The great wealth of the province is in its flocks and herds, which are reared in great numbers on the *campinas* or prairies. It is stated that 500,000 cattle, whose hides and flesh are preserved, are slaughtered here annually, while as many more are driven northward for ordinary consumption. All the cereals and fruits of central Europe can be grown here advantageously, and the inhabitants are awakening to the importance of developing the immense agricultural resources of the province. A considerable area is now covered with crops of maize, beans, wheat, and potatoes, and the agricultural products, which, till recently, were of little account, now form one-eighth of the whole exports. The gold mines of the province have yielded in one year 6,100 ounces, the value of which is stated at £25,000. The principal articles of export of the province are beans, horns, hair, cattle and horse hides, grease and tallow, jerked or dried beef, tongues, mandioc, flour, and maize. Of the most of these articles, the quantity exported has increased so rapidly as in a few years to be considerably more than doubled. Half of all the imports of the province consists of cotton, woolen, and linen manufactures, coals, earthenware, and hardware from Great Britain. The principal towns are Porto Alegre (q.v.) and Sao Pedro. The latter, a small but prosperous and increasing seaport at the s. extremity of the lake Des Patos, and close to the sea, imported in 1872-73 goods to the amount of £365,300, while its exports in the same year amounted to £1,106,900. The arrivals from foreign ports were 929 vessels, of 198,029 tons; the departures 698 vessels, of 212,936 tons. The arrivals from Brazilian ports were 840; tonnage, 221,213; the departures, 890; tonnage, 185,060. Three lines of steamers run to Porto Alegre.

RIOJA, LA, a province in the w. of the Argentine republic, bounded on the n. by Catamarca, on the e. by Cordova, on the s. by San Luis, and the w. by Chili; drained by the Bermejo river, intersected by the Andes, Famatina, Rioja, and Jagüe ranges; about 35,600 sq. m.; pop. about 50,000. The surface is composed of great plateaus and valleys. Gold, silver, nickel, copper, tin, quartz, antimony, and other metals are found. The soil is fertile. The chief productions are cotton, wheat, corn, and fruits. Cattle, timber, dyes, and wax are exported. Among the manufactures are cotton and woolen goods, and leather. Capital, La Rioja.

RIPARIAN RIGHTS, in law, the rights of the proprietors of lands bordering on rivers or other natural water courses. The old common law definition of a navigable river, as one in which, and only as far as, the tide ebbs and flows, is rejected in this country, and the word navigable is used in its wider sense. The state, in case of navigable rivers, has control of the shore below high water mark, or, if not tidal, below the average water line, and may control the erection of wharves or other constructions, though the public are not to be restrained in the exercise of the privileges of fishing and navigation. It follows that no obstruction is allowed except by the consent of the legislature. Unnavigable streams are sometimes called private rivers. The proprietors on either side own the bed of the stream up to the middle line. The bed cannot therefore be widened or enlarged so as to bring the river into public use without compensation to the riparian proprietors. But the latter have no ownership in the water itself but only the right of use. They may therefore employ the stream for purposes of industry or ornamentation but must not interfere with similar rights of proprietors above or below, or overflow and damage their lands. They may divert it from its natural channel while passing through their land, but must restore it thereto at its exit. If the land on the opposite sides be owned by different parties, their right to the use of the water is an undivided one, and one party cannot deprive the other of the use. Some states have passed statutes allowing the owners of certain kinds of manufactories or mills to acquire the right of flowing the lands of others by damming the stream, under the power of eminent domain and through commissions appointed for that purpose. *Alluvion*, the soil added to a shore by gradual natural processes, is the property of the owner of such shore. But where *avulsion*, the sudden removal of large quantities of the soil from the land of one owner to another occurs, the title to such land does not change. So, if the stream change its course, the former boundary is not changed but the whole river bed may become the property of him through whose land it flows.

RIOM, a small t. of France, in the dep. of Puy-de-Dôme, is picturesquely situated on a hill, 1173 ft. above the sea, 8 m. n.n.e. of Clermont. It is built of dark lava, and is a

perfect treasure of domestic architecture, especially of the renaissance period. Linen, leather, and brandy are manufactured. Pop. '76, 8,733.

RIO NEGRO, one of the principal affluents of the Amazon, rises in an unexplored district of the s. of the United States of Colombia (New Grenada), flows in a general s.s.e. direction, and joins the Amazon at Manaos, after a course estimated at 1000 m. in length. It receives from the n. the Cassiquiare (q.v.), by means of which communication is established between the Orinoco and the Amazon; also the Cababuri, Padaviry, Branco, and other large streams; from the s. comes its greatest affluent, the Vaupes. It is $1\frac{1}{2}$ m. broad when it enters the Amazon.

RIO NEGRO, a river of South America, forms the greater part of the boundary between the Argentine republic and Patagonia. At its source, it is called by the natives Melly-roumey-co—i.e., *four small rivers*—from the fact that it is formed by four headwaters from the bosom of the Cordilleras. It is afterward called by the natives Courou-roumey-co, or Black river (Span. Rio Negro), from the dark color of its waters, caused by the depth and narrowness of its channel. It flows first n.e., then e. and s.e. through the plains to the Atlantic, into which it falls in lat. $41^{\circ} 3'$ s., after a course of upward of 700 miles. Shoals and islands obstruct its channel, and it is navigable only for 20 m. above its mouth.

RIONE RO, a large t. of southern Italy, in the province of Potenza, 7 m. s. of Melfi; pop. 12,051. It produces grain, maize, pulse, and wine. The inhabitants are agriculturists and shepherds. There is a great trade carried on in maple snuff-boxes, which are manufactured here.

RIOSE'CO, MEDINA DE, a small t. of Spain, in the province of Valladolid, and 26 m. n.w. of the city of that name, stands on two hills in a fertile district. In the middle ages it was the center of considerable trade, but it has much declined in recent times. The chief church is that of Santa Maria, a beautiful Gothic edifice, richly decorated, and containing several excellent pictures. Here, in 1808, a Spanish army, 50,000 strong, under Blake and Cuesta, was defeated, with a loss of 6,000 men, by 12,000 French troops under Bessières. The chief result of this battle was that Joseph Bonaparte was placed on the throne of Madrid. After the defeat, the unresisting town was sacked with more than wonted barbarity. Pop. about 4,500.

RIOT is the legal name of an offense which consists in the assembling of three or more persons for an illegal purpose, or for the carrying out of a legal purpose in an illegal manner. Riots often commence in some supposed private wrong. Some degree of violence is incidental to a riot, and a degree of intimidation to the neighborhood. A riot cannot take place unless at least three persons act in concert. When a riot becomes formidable, it is usual for the authorities to take active measures to disperse it. Thus, any justice of the peace may command the persons assembled to disperse peaceably by a form of words called reading the riot act, which is as follows: "Our sovereign lady the queen chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in an act of King George for preventing tumults and riotous assemblies.—God save the queen." If the rioters, after this formal proclamation, remain more than one hour afterward, they are guilty of felony, and may be seized and carried before a justice. Sometimes it is difficult to distinguish between an illegal assembly and one which is legal, though noisy and tumultuous, and the opinion of the justice of the peace is not conclusive as to its illegality. Sometimes the riot act is read more than once during the disturbance, in which case the second or third reading does not supersede the first.

RIOUW, a Netherlands residency or government in the eastern archipelago, since Siak and dependencies were taken from it, consists of the peninsula of Tandjong Pinang, the Lingga-Riouw archipelago, a part of the coast of Sumatra, n. of Djambi, and the adjoining kingdom of Iudragiri; also the Tambilan, Anambas, and Natuna islands. Area, about 3,000 sq. miles. Pop. '73, of the residency, 69,386, including 144 Europeans, 27,782 Chinese (25,678 being males), and 41,303 natives.

The islands of the archipelago are mountainous, the peak of Lingga rising to 3,712 feet. Many of them are covered with heavy timber and a dense underwood, through which it is difficult to force a way. As far as is known, the prevailing rocks are granitic and sandstone. Gold is found in Lingga, and tin was formerly extensively wrought; but the richer mines of Sinkep and the Carimon islands, in the southern entrance of the strait of Malacca, now yield the largest amount of that ore. Coal is also found in the Riouw-Lingga islands.

The climate is not considered unhealthy, though at times the heat is intolerable. The chief products are sago, pepper, damar resin, gambir, gutta-percha, rattans, cotton, fruits, and many varieties of fine timber. Edible nests are found in abundance, and the waters swarm with fish. Agar-agar, tripang or bêche-de-mer, and shell-fish are largely collected. The native Malays chiefly gain a living by fishing, and the Chinese have extensive *uncaria gambir* and pepper gardens. Imports, 1872, £372,422; exports, £369,213.

The industries are manufacturing gambir, distilling arrack, weaving silks, ship-

building, wood-cutting, tile and brick making, together with extensive fisheries. The original inhabitants are Malays, who are more numerous in Lingga than the other islands. The strangers are Europeans in the pay of the Netherlands colonial government, Chinese, Buginese, and Javans. The town is at the n. w. end of Tandjong Pinang, 54° 4' n. lat., and 104° 26' 30" e. long., in a beautiful bay where there is safe anchorage. Pop. 8,609. —See *Journal of the Ind. Archip.* vol. i.; Crawford's *Descriptive Dict.*; *De Residentie Riouw* door J. J. de Hollander; and colonial reports of 1875-76.

RIPLEY, a co. in s. e. Indiana, crossed by the Ohio and Mississippi, and the Indianapolis, Cincinnati and Lafayette railroads; drained by Laughery creek; 450 sq. m.; pop. '80, 21,627. The surface is undulating, the soil fertile, and limestone is found in some parts. The chief productions are grain, hay, tobacco, wool, hops, and sorghum. Sheep and swine are raised. There are numerous carriage, wagon, saddlery, and harness manufactories, tanneries, flour, and saw mills. Co. seat, Versailles.

RIPLEY, a co. in s. Missouri, bordering on Arkansas; drained by the Current and Little Black rivers; 600 sq. m.; pop. '80, 5,377—5,277 of American birth; 10 colored. The surface is hilly, and heavily wooded; wheat, oats, corn, and hay are the staples. Co. seat, Doniphan.

RIPLEY, ELEAZER WHEELOCK, 1782-1829; b. Hanover, N. H.; son of Sylvanus Ripley, D. D., professor of divinity in Dartmouth college, and nephew of pres. John Wheelock. He was a graduate of Dartmouth, 1800; in 1811 removed to Maine and practiced law in Portland; was a member of the Massachusetts legislature, speaker of the house, and state senator 1810-12. In the war of 1812 he was commissioned lieu. col. and col., and was wounded at York, N. C. He commanded the 2d brigade, under gen. Brown, in the battles of Chippewa and Niagara; wounded in the latter, and brevetted maj. gen. He fought gallantly in the defense of fort Erie, was wounded in the neck, and for his bravery was presented by congress with a gold medal bearing the legend, *Niagara, Chippewa, Erie*. He left the army in 1820, resumed the practice of law in Louisiana, and represented his state in congress 1835-39.

RIPLEY, GEORGE, LL. D., 1802-80; b. Mass.; graduated at Harvard college in 1823, and the divinity school in 1826; pastor of a Unitarian church in Boston 1826-28; associate editor with Ralph Waldo Emerson and Margaret Fuller of the *Dial* 1840-41; one of the editors of the *Harbinger*, a Fourierite paper, 1844-48; prominent in the socialist experiment at Brook Farm, Roxbury, 1844-46. In 1847 he removed to New York, and was the literary editor of the *New York Tribune* until his death. He was also one of the editors of Appleton's *New American Cyclopaedia*. He published a dissertation on the *Philosophy of Religion*; Letters to Andrews Norton on *The Latest Form of Infidelity*; edited *Specimens of Foreign Standard Literature* 1838-42, 14 vols., and with Bayard Taylor, *Handbook of Literature and the Fine Arts* 1852-57. He contributed to the *Christian Examiner*, and *Putnam's* and *Harper's Magazines*. He was an admirable writer, with wide literary knowledge and fine taste. His criticism was not noted for severity.

RIPLEY, HENRY JONES, D. D., 1798-1875; b. Mass.; graduated at Harvard college in 1816, and Andover theological seminary in 1819; ordained in Boston as an evangelist, and was pastor for 7 years of the North Newport Baptist church in Liberty co., Ga.; elected in 1826 professor of Biblical literature and pastoral duties in Newton theological institution; became in 1829 professor of sacred rhetoric and pastoral duties, resigning in 1860. Subsequently he preached among the freedmen of Georgia. Returning to Newton he was made librarian of the seminary. He published several theological treatises.

RIPLEY, JAMES W., 1794-1870; b. Conn.; educated at West Point. After serving in the artillery, he was transferred to the ordnance department in 1832, in which he remained till his retirement from the service in 1863, being its chief 1831-63. He took part in the war of 1812 and the Seminole war.

RIPON, a city in s. e. Wisconsin, on the Sheyboygan and Fond du Lac railroad at its junction with the Chicago, Milwaukee, and St. Paul; pop. '70, 3,501. It is pleasantly situated on Green lake, an inlet 9 m. in length, 20 m. n. w. of Fond du Lac, and 19 m. s. w. of Oshkosh. It is the seat of Ripon college (Congregational), has 9 churches, 2 public halls, 3 hotels, 2 newspapers, and is lighted by gas. The leading industries are the manufacture of carriages, flour, pickles, and wagons.

RIPON, a market t., and municipal and parliamentary borough, in the West Riding of Yorkshire, 23 m. n. w. of York. The market-place, to which the four principal streets lead, is spacious, surrounded by good houses and shops, and has in its center an obelisk 90 ft. high. Ripon is a bishop's see. The cathedral, founded 1109-14, is cruciform, is surmounted with two uniform towers, 110 ft. high at the w. end, and also by a center tower. It is esteemed one of the best proportioned churches in the kingdom. Trinity church, built in 1826, is a fine cruciform edifice in early English. There are other places of worship, two hospitals, and a number of important schools, one of which, the grammar-school, has an endowment of £600 a year. The principal branches of industry are machine making, tanning, malting, and brass and iron founding. There are also several flour-mills and varnish factories. Pop. '71, 6,806.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, D.C.L., Marquis of; b. London, 1827; son of viscount Goderich to whose title he succeeded in 1859. He was returned to parliament in 1852, where he served till his succession to the upper house. On the death of sir G. C. Lewis he became secretary for war, and entered the cabinet. In 1866 he was appointed secretary of state for India. He became lord president of the council on Gladstone's accession to office in 1868. In 1871 he was chairman of the high joint commission which resulted in the treaty of Washington, and on his return from the United States was created marquis. In 1874 he was received into the Roman Catholic church. In 1881 he succeeded lord Lytton as viceroy of India.

RIPPLE-MARK. Undulations similar to those observed on sandy shores, and produced by the particles of sand being drifted along by the water, have been observed on the surface of sandstones of all ages. They may be held generally as indicating that the deposition of the bed on which they occur took place on a sea-beach, or under water not more than 10 ft. deep. Recent ripple-marks have, however, been observed at a depth of 60 ft., and there is reason to believe that mud and sand may be disturbed at much greater depths by currents of water. Loose sand also may be driven by the wind into ripple-waves, that cannot be distinguished from those produced by the receding tide.

RISHI (from the obsolete Sanskrit *rish*, see, kindred with *δῖς*, - *δεῖν*) is the title given to the inspired poets of the Vedic hymns, as they were supposed to have "seen," or, in other words, received, the Vedic hymns from the deity through the sense of sight. "The Rishis," Yaska (q.v.) says, "see the hymns with all kinds of intentions." They were therefore the oldest poets of India, and the word Rishi itself becomes thus even identified with Vedic poetry. At a later period, however, the title Rishi was given to renowned authors, though they were not considered as inspired by a deity, as, for instance, to the authors of the Vedic Kalpa, works which, by all Hindu writers, are admitted to be of human authorship.—Compare Goldstücker, *Pāṇini*, etc., p. 64, ff.

RISING, in heraldry, a term applied to a bird when represented opening his wings as if about to take flight.

RISING IN THE AIR. The name of a belief (prevalent in the middle ages) that the bodies of holy persons were sometimes lifted up and suspended in the air during the continuance of a religious ecstasy. Calmet states in his work on Apparitions that this singular phenomenon might be produced by the fervor of the Holy Spirit; by the ministry of good angels; or by a miraculous favor of God, who desired thus to do honor to his servants in the eyes of men. Numerous instances are recorded in the *Acta Sanctorum*. St. Philip of Neri, in his religious ecstasies, was elevated in the air, sometimes to the height of several yards, almost to the ceiling of his room, and this quite involuntarily. He tried in vain to hide it from the knowledge of those present, for fear of attracting their admiration. St. Ignatius de Loyola was sometimes raised up from the ground to the height of 2 ft., while his body shone like light. St. Robert de Palentin rose also from the ground sometimes to the height of a foot and a half, to the great astonishment of his disciples and assistants. In the life of St. Dunstan it is stated that, a little time before his death, as he was going up stairs to his apartment, accompanied by several persons, he was observed to rise from the ground; and as all present were astonished at the circumstance, he took occasion to speak of his approaching death. In a recent biography of Girolamo Savonarola, it is also stated that while that martyr was in prison, shortly before his execution, he was observed once, while in prayer, raised from the ground, and was seen distinctly suspended in the air for some short period.

These relations account for the frequency with which representations of saints are exhibited in an aerial position in mediæval paintings and works of art. This belief falls in with one of the alleged phenomena of modern Spiritualism (q.v.).

RISK, in point of law, is used chiefly in reference to the sale of goods, and injury or loss to the goods before delivery. On such occasions, the question, in English law, is governed by the previous question, whether the property has passed or not by the sale. If it has, then whoever is the owner must bear the loss of the goods. In Scotland, the risk is with the buyer of goods, whether the right of property has passed or not. See CARRIER.

RISOTTO, an elegant Italian dish, consisting chiefly of rice. Onions are shredded into a frying-pan with plenty of butter, and they are fried together until the onions become very brown, and communicate their color to the butter. The butter is then run off, and to this is added some rich broth, slightly colored with saffron, and the whole is thickened with well-boiled rice, and served up instead of soup, at the commencement of a dinner.

RISOLE, a culinary preparation used as an *entrée*. It consists of meat or fish of any kind finely minced and made into small forms, which are then coated with a very thin crust either of pastry or of bread-crumbs, mixed with yolk of egg, and fried. There is great variety in this dish.

RISTORI, ADELAIDE, a celebrated Italian tragic actress, was b. in 1821 at Cividale in Frioul. Her parents were strolling players, and she almost began life in the theater. At the age of 14 she played in *Francesca da Rimini*, and in a few years became the leading Italian actress. Her talents, her beauty, and her grace made her a universal favor-

ite. In 1847 her marriage with the marquis Capranica del Grillo (who died in 1861) temporarily interrupted her dramatic career; but after two years she returned to the stage, and appeared at Rome in Alfieri's tragedy of *Myrrha*. But the French attack on the city caused her to desert the theater for the hospital, where she employed herself assiduously in nursing the wounded. After having acted in 1850 and succeeding years at Rome and Turin in various characters of Alfieri with immense applause, she presented herself before a French audience in 1855, when Rachel was in the height of her fame, a proceeding considered in the light of a challenge by the first Italian actress to the first French actress. Even at Paris she obtained a triumph, her genius creating an enthusiasm which could not be repressed. Without all the sympathetic sensibility of Mme. Rachel, she surpassed her in vivacity and expression. She has since appeared with success in England, the United States, etc.

RITCHIE, a co. in n.w. West Virginia; drained by the n. and s. forks of Hughes river; traversed by a division of the Baltimore and Ohio railroad; 330 sq.m.; pop. '80, 13,474—13,236 of American birth, 64 colored. The surface is uneven and the soil moderately fertile; wheat, hay, oats, corn, maple sugar, and dairy products are the staples. Co. seat, Harrisville.

RITCHIE, ANNA CORA (MOWATT), 1819-70; b. Bordeaux, France; daughter of S. G. Ogden of New York; came to this country and at 15 years of age married James Mowatt, a lawyer in New York. She visited Europe on account of failing health; sufficiently recovered, she appeared in private theatricals, and then in public readings; studied for the stage and made her *début* in the *Lady of Lyons*, at the Park theater; playing an engagement at the Howard Athenæum, Boston, 1845. In 1847 she played in Manchester and Dublin, and was leading lady at Marylebone theater, acting with E. L. Davenport through many engagements. Her husband having died abroad, she retired from the stage in 1851, returned to America, and in 1854 married W. F. Ritchie, editor of the *Richmond Examiner*. He died in 1868, and she thenceforth resided in England and corresponded for American newspapers. She published several novels and plays; also compilations in prose and verse.

RITCHIE, THOMAS, 1778-1854; b. Va.; became editor of the *Richmond Examiner* in 1804. He changed its name to *Enquirer*, and remained its editor and proprietor till 1845, when he removed to Washington, where he founded the *Union* as the official organ of Polk's administration. His last years were passed in Richmond. The *Enquirer* under his management was the leading journal in the south.

RITĒ (Lat. *ritus*) is in general an external sign or action employed in religious use, and designed either to express or to excite a corresponding internal religious feeling. Such are, for instance, the uplifting or outstretching the hands in prayer, the imposition of hands in blessing, etc. The ancient Jewish religion abounded with rites and ceremonies, and through their excessive multiplication in the religions of the Gentiles, religion degenerated almost entirely into outward form. A marked distinction in this respect is drawn by our Lord (John iv. 23) between the old and the new law, which one class of Christians have interpreted as a condemnation of all external ceremonial, while even those who contend for the retention of ceremonies in Christian worship require that their use should always be accompanied and elevated by the corresponding internal spirit. The great ground of difference in the Puritan controversy in England and the corresponding disputes in continental churches, was the lawfulness of ceremonies. See GENUFLEXION, PURITAN.

The name rite is sometimes used to signify the aggregate of all the ceremonies used in a particular religious office, as the "rite" of baptism or of the eucharist. In a still wider sense it is used of the whole body of distinctive ceremonial, including the liturgy employed by a particular community of Christians. In this way we speak of the "Roman rite," the "Greek rite," the "Syrian rite," the "Armenian rite," the "Coptic" or the "Slavonic rite."

RITENU TO (Ital. kept back), a term in music implying that the speed of the movement is to be diminished.

RITES, CONGREGATION of, a committee of cardinals in the Roman Catholic church, founded by pope Sixtus V. The number of members is determined by the reigning pope. At first it was composed of 6 cardinals, with several secretaries and consultants. In 1875 it had 17 cardinals, 25 consultants, and 11 officials. It takes cognizance of the liturgy, the rites pertaining to the sacraments, the rubrics of the missal and breviary, the ceremonies of the church in its public functions, and the canonization of saints. The congregation meets at the house of the prefect who is the senior cardinal of the committee.

RITNER, JOSEPH, 1780-1869; b. Penn.; received little school education. He entered politics about 1820, became a leader of the anti-masonic party about 10 years later, and after running unsuccessfully three times, was elected governor in 1835, and remained in that office till 1839. In 1849 he was appointed director of the Philadelphia mint. He was an advocate of "total abstinence" and antislavery.

RITORNELLO (Ital. return), in music, in its original sense, a short repetition like that of an echo, or a repetition of the closing part of a song by one or more instruments.

The same term has, by later usage, been applied to all symphonies played before the voices begin which prelude or introduce a song, as well as the symphonies between the members or periods of a song.

RITSCHL, FRIEDR. WILLI., one of the first (perhaps the very first) classical philologists of modern times, was b. at Grossvargula in Thuringia, April 6, 1806. He studied at Leipzig under Hermann, and from 1826 to 1829 at Halle, where he eagerly availed himself of the lectures and society of Reissig. In 1832 he was called to Breslau as extraordinary professor, receiving at the same time a joint-directorship of the philological seminary there. Two years afterward he became ordinary professor, and spent the winter and spring of 1836-37 on a learned tour through Italy. In 1839 he accepted an invitation to Bonn as professor of classical literature and rhetoric. The Prussian government conferred on him the rank of privy-councilor in 1856. His first literary works were devoted to the Greek grammarians, as the edition of Thomas Magister (Halle, 1832), the acute and penetrating treatise, *De Oro et Orione* (Bresl. 1834), and the richly elucidatory *Die Alexandrin. Bibliotheken und die Sammlung der Homerischen Gedichte durch Pisis-tratus* (Bresl. 1838), sufficiently prove; but by far his greatest work is his edition of Plautus (Bonn, 1848-53), executed with the richest critical apparatus. It was accompanied by a comprehensive *prolegomena* on the Plautinian meters. The work secured for him a splendid reputation among his countrymen. Among the numerous productions of Ritschl which may be regarded as preparatory to this *chef d'œuvre*, the most important is his *Purpura Plautina et Terentiana* (Leip. 1845). Subsequently his literary activity took another direction—viz., a systematic treatment of Latin inscriptions, with the view of illustrating the history of the Latin language. His labors in this department have been crowned with success, for Ritschl has thrown more light upon the successive phases of the language than any other single individual. To this field belong his *Lex Rubria* (Bonn, 1851); *Titulus Minimianus* (Berl. 1852); *Monumenta Epigraphica Tria* (Berl. 1852); *Inscriptio Columnæ Rostratæ* (Berl. 1852); *Anthologia Latina Corollarium* (Berl. 1853); *De Sepulero Furiorum* (Berl. 1853); *De Fictilibus Litteratis, etc.* (Berl. 1853); *Poesis Saturniana Spicilegium* (Bonn, 1854); *De Titulo Metrico Lambacensensi* (1855); *De Varronis Hebdomadum Libri* (1855); *In Legibus Viselliam, Antoniam, Corneliam Obscrationes Epigraphicæ* (1860); and *Proemiorum Bonnensium Decas* (1862). Besides these works Ritschl contributed a large number of learned dissertations to the programmes of the university of Bonn, in the *Transactions* of the archæological institute of Rome, and in the *Rheinisches Museum für Philologie*. On the 25th anniversary of his appointment to Bonn, there began to be published *Symboli Philologorum Bonnensium in Honorem Frid. Ritschlii* (1864-67). In 1867 Ritschl, 30 of whose pupils were then professors in German universities, was appointed foreign associate of the French academy of inscriptions and belles lettres. He died in 1876.

RITSON, JOSEPH, 1752-1803; b. England; called to the bar, but gave his chief attention to literature. Among his works are *Remarks Critical and Illustrative on the Text of the last Edition of Shakespeare*, 1783, in which he attacks Dr. Johnson and Steevens; *A Select Collection of English Songs*, 1783; *Ancient Songs from the Time of King Henry III. to the Revolution*, 1790; *The English Anthology*, 1793-94; *Robin Hood*, 1795; and *Ancient English Metrical Romances*, 1795. He was a learned and accurate English scholar, but bitter in his numerous literary controversies.

RITTENHOUSE, DAVID, LL.D., 1732-96; b. Penn.; the great-grandson of a Hollander, who established at Germantown about 1690 the first paper-mill in America. Before he was 17 he made a clock without having received any instruction, and in 1751 devoted himself to clock-making. In 1755 he made an orrery, which was purchased by Princeton college, and in 1763 he was engaged to determine the boundary-line since known as Mason and Dixon's, for which he used instruments of his own construction. Later he settled the boundaries between New York, New Jersey, Pennsylvania, and several other states. He was appointed by the American philosophical society to observe the transit of Venus, June 3, 1760; was treasurer of Pennsylvania 1777-89; succeeded Franklin as president of the philosophical society in 1791; and was director of the U. S. mint, 1792-95. His life has been written by William Barton; and also by James Renwick in Sparks's *American Biography*.

RITTER, HEINRICH, German philosopher, was born at Zerbst in 1791; studied theology at Halle, Göttingen, and Berlin from 1811 to 1815, and in 1824 was created professor extraordinarius at Berlin university. In 1835 he accepted a call to the university at Kiel, and went thence in 1837 to Göttingen. Ritter owes his literary fame especially to his profound works on the history of philosophy. The principal are *Ueber die Bildung des Philosophen durch die Geschichte der Philosophie* (On the Education of the Philosopher through the History of Philosophy), 1817; *Welchen Einfluss hat die Philosophie des Cartesius auf die Ausbildung der des Spinoza gehabt?* (What Influence has the Philosophy of Descartes exercised on that of Spinoza?) Leip. and Altenb. 1817; *Ueber die Philos. Lehre des Empedokles* (On the Philosophical Doctrine of Empedocles), 1820, in Wolf's *Literary Analecta*; *Geschichte der Ionisch. Phil.* (History of the Ionian Philosophy), Berl. 1821; *Geschichte der Pythagorisch. Phil.* (History of the Pythagorean Philosophy), Hamb. 1826; *Bemerkungen üb. die Phil. d. Megarisch. Schule* (Remarks on the Philosophy of the Megaric School), Rheinisches Museum, 2d series; *Gesch. der Phil.* (History of Philosophy),

vol. i.-xii. Hamb. 1829-53; 2d ed., vol. i.-iv., 1836-38; *Vorlesungen zur Einleitung in die Logik* (Introductory Lectures to Logic), Berl. 1823; *Abriss der Philosophisch. Logik*, Berl. 1824; *Die Halb-Kantianer und der Pantheismus* (The Half-Kantians and Pantheism), Berl. 1827; *Ueber das Verhältniss der Philosophie zum Wissenschaftlichen Leben Ueberhaupt* (On the Relation between Philosophy and Scientific Life in General), Berl. 1835; *Ueber die Erkenntniss Gottes in der Welt* (The Recognition of God in the World), Hamb. 1836; *Ueber das Böse* (On Evil), Kiel, 1839; *Philosophical Essays* (Kiel, 1839-40); *System der Logik und der Metaphysik* (Gött. 1856); *Die Christliche Philosophie* (2 vols. Gött. 1858-59); *Encyclopädie der Philosophischen Wissenschaften* (vols. 1 and 2, Gött. 1862-63). Ritter was not a partisan of any philosophical school, but a critic of all. He died in 1869.

RITTER, KARL, an illustrious geographer, was b. Aug. 7, 1779, in Quedlinburg, in Prussia, studied in Halle, was nominated in 1820 professor extraordinarius of geography at Berlin university, became subsequently member of the academy, and director of studies at the military school. He died Sept. 28, 1859. With Ritter, as the founder of general comparative geography, begins a new epoch in the history of geographical science. His chief works are: *Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen* (Geography in its Relation to Nature and the History of Men), 17 vols. Berl. 1822-54. The work is divided into 4 parts—1. Introduction and East Asia, in 5 vols., containing Middle Asia, High Asia, Siberia, China, and India, vol. ii.-vi.; 2. West Asia, in 5 vols. (vol. vii.-xi.); 3. Arabia (vol. xii.-xiii.); 4. The Sinai Peninsula, Palestine, Syria (vol. xvi.-xvii.), with 4 indexes, and an atlas of Asia. Introduction to an Essay on a more Scientific Treatment of Geography (Berl. 1852); *Europa, ein Geographisch., Historisch., Statistisches Gemälde* (Europe, a Geographical, Historical, Statistical Picture), 2 vols., Frankf. 1807; *Die Stupas, oder die Architect. Monumente, etc.* (The Stupas, or the Architectural Monuments on the Indo-Bactrian Royal Road, and the Colossus of Bamyan), Berl. 1838. Many of his antiquarian and historico-antiquarian researches are contained in the *Monatsberichten* of the Berlin geographical society, and in the *Zeitschrift für Allgemeine Erdkunde, etc.* Other noteworthy productions are: *Die Colonisirung von Neu Zealand* (Berl. 1842); *Blick auf das Nilquellland* (Berl. 1844); *Der Jordan und die Beschöpfung des Todten Meeres* (Berl. 1850); *Ein Blick auf Palestina und die Christliche Bevölkerung* (Berl. 1852).

RITUAL (Lat. *rituale*, a book [or collection] of rites), the name of one of the service-books of the Roman church, in which are contained the prayers and order of ceremonial employed in the administration of certain of the sacraments and other offices of the church. The ceremonial of the offices of the Roman church administered by bishops is contained in the books entitled *Pontificale* and *Ceremoniale Episcoporum*. The priestly offices are detailed in the ritual. In its present form it dates from the council of Trent, which directed a revision of all the different rituals then in existence, which were numerous, and exhibited considerable variety of detail. Paul V., in 1614, published an authoritative edition, which has frequently been reprinted, and of which a further revision was issued by Benedict XIV. Besides the Roman ritual, there are many diocesan rituals, some of which are of much historical interest. In the Greek church, as in the other eastern communions, the ritual forms part of the general collection (which contains also the eucharistic service) entitled *Euchologion*. In the Anglican church, also, the *Book of Common Prayer* may be said to contain the ritual. The most approved commentary on the Roman ritual is that of Barrufaldo (2 vols. Florence, 1847).

RITUALISM, the name popularly but inaccurately given to the remarkable increase of ceremonial in the church of England since the year 1863. It may be considered as a development of tractarianism, though it is one not contemplated by the authors of that movement, whose aim was rather to disseminate doctrines than to introduce ritual changes. Its collateral causes may be said to be: (1) The great advance of æsthetic taste, and the increased cultivation of the fine arts in the service of religion. (2) The extended study by the clergy of ancient liturgies, and the connection discovered to exist between them and the offices of the English church. With the spread of high-church principles, certain changes in the mode of conducting divine service had been introduced by the clergy, which, though unpopular at first, were widely adopted, and, up to a certain point, had received the sanction of the law. But the restored church with low and open benches—the separated chancel—the altar-table with coverings of different color according to the ecclesiastical seasons, and candlesticks, and a cross upon or over it—choral services, and weekly celebration of the communion, were all that had hitherto been attempted. To these comparatively small alterations, important additions have recently been made—viz. (1) Special vestments at the celebration of the holy communion, and at certain other times, viz., for the celebrant, an alb and stoles, of different color, and chasuble; for the assisting ministers, albs with tunicles, according to the seasons. At other times a cope is worn instead of a chasuble, (2) Lighted candles on the altar at holy communion. (3) Incense burned either in a "thurible" or in a standing vessel. (4) The mixing of water with wine for the communion. (5) The use of wafer-bread. (6) Elevation of the elements either during or after consecration. (7) The attendance of non-communicants at the holy communion. (8) Processions with crosses, banners, and vested attendants.

These innovations are defended by their promoters on the following grounds of (a) law, (b) doctrine, and (c) expediency.

(a) The rubric at the end of the calendar in the Book of Common Prayer enacts "that such ornaments of the church and of the ministers thereof at all times of their ministrations shall be retained and be in use as were in this church of England by the authority of parliament in the second year of the reign of king Edward VI." The judicial committee of the privy council in the case of *Westerton v. Liddell* (1857), ruled that "ornaments" here means, "all articles used in divine service;" that the words "by authority of parliament," etc., refer to the first prayer-book put forth in that reign (1549); and that "the meaning of the rubric, as of the previous statute of Elizabeth, the language of which it adopts, is, that the same dresses, utensils, and articles which were used under the first prayer-book of Edward VI. may still be used." Now, the first prayer-book of Edward VI. prescribes that at the time of the communion "the priest that shall execute the holy ministry shall put on him a white alb plain with a vestment, i. e., a chasuble, or cope;" and the assistants "likewise the vestures appointed for their ministry, that is to say, albs with tunicles." It is therefore inferred that the above are the only legal vestments in which the holy communion should be celebrated. To this it is objected (1) That the word "retained" can only refer to such vestures as were in use up to the time of the last publication of the rubric—viz., the surplice in parish churches, and copes in cathedrals. (2) That the rubric, when first inserted under Elizabeth, was limited by the injunctions and advertisements of that reign, which aimed only at the restoration of the surplice. (3) That whatever be the intention of the rubric, it has been so long obsolete that it is absurd to revive it. It is answered (1) That the word "retained" must have the same meaning that it had in the rubric of Elizabeth, in which it first occurs. (2) That the injunctions and advertisements were not of supreme authority, and were only intended to help toward restoring a decent uniformity in divine worship. (3) That the fact that a law has become obsolete does not invalidate its force. The same reference of the ornaments rubric to the second year of Edward VI. is held to authorize other accessories known to have been in use at that time, though not specified in the first Prayer-book—such as lighted candles, incense, etc. And on the principle that the Reformed church was legally identical with that before the reformation—which the 30th canon of 1603 is cited as maintaining—it is further contended that all ancient laws and usages are still in force, except where directly or implicitly abrogated by subsequent enactment. And as the chief ritual authority before the reformation was the liturgy of Sarum (the Sarum "use" referred to in the preface to the present prayer-book), it is to that standard, as far as possible, that the more advanced ritualists desire to conform.

(b) The doctrinal grounds of defense are expressed in the following statements: (1) The eucharist (as the Lord's supper was anciently called) is the special institution of Christ, the single rite of continual observance which he enjoined on his disciples, and the chief act of Christian worship. It is therefore right to exalt and dignify it above all other services, and mark it as standing on different and higher ground than any other institution. (2) The eucharist, according to the universal belief of the ancient church, is to be regarded as a sacrifice, *commemorative*, as the Jewish sacrifices were *anticipatory*, of the death of Christ—not as iterating or repeating it (which idea alone the 31st article is held to condemn), but as a solemn pleading and offering of it before God, as Christ himself offers it in heaven. Hence the position of the celebrant in front of the altar, and the use of a sacrificial vestment, as the chasuble is held to be. (3) In the eucharist, there is a real presence of Christ, which, though spiritual, is *objective*, i. e., not dependent on the receiver, but as a result of consecration, and to a certain extent *local*. (The growth of this belief is marked by the change made in a recent edition of Keble's *Christian Year* of the words, "not in the hands," in a poem on the eucharist, to, "as in the hands.") Hence distinct acts of adoration, addressed, not, as is explained, to the elements, but to the divine presence, of which they are the vehicles and signs.

(c) On the ground of *expediency* also, it is contended: (1) That experience proves that the only way of attracting and gaining a hold on the vast uneducated masses of our towns and cities is by a worship addressed not merely to the ear, but to the eye. "Ritualism," says one of its defenders, "is the *object-lesson* of religion." Services conducted in grand and beautiful buildings—brilliantly lighted—with splendid vestments, touching music, costly decorations, and every outward token of reverence and solemnity, will impress the young and the poor as nothing else can do. Those churches in London where advanced ritual prevails are said to be thronged with worshippers—mainly of the lower classes, and in great proportion of men—when others are almost empty. (2) A further argument, under this head, is connected with the desire, which has grown up of late years among the High church party, for the restoration of the visible unity of Christendom, and specially the renewal of communion between the church of England and both the Eastern and the rest of the Western church; and with this view, it has become an avowed object to assimilate the Anglican service as much as possible to that of other Catholic churches.

It remains to notice briefly the effect of these innovations. It is a remarkable index of the change of popular feeling within the last twenty years, that such hold and startling changes, altering the whole character of the Anglican service, should, by a large

number of people be not only tolerated, but approved. In 1859 the attempt of the rector of St. George's-in-the-east to introduce eucharistic vestments led to riots which convulsed the whole of east London. In the year 1867, in about twelve churches of the metropolis—and in several country towns and villages—a far more advanced ritual, with vestments, altar-lights, and other ceremonies, regularly attracted an eager throng, not of spectators only, but of worshippers. And the spread of the movement may be judged by the statement, which appears authorized by facts, that within a few months after the first report of the royal commissioners on ritual, the vestments were introduced in more than thirty churches. On the other hand, among the "Protestant" members of the church, and those of other denominations, the movement has provoked the loudest opposition. Most of the bishops have, directly or indirectly, expressed their disapprobation; the press, except two or three journals, which are its strenuous advocates, is almost unanimous in denouncing it; the more moderate members of the high church party discourage it; and active efforts have been made to arrest it by legislative interference. In the lower house of convocation, on the motion of the dean of Ely, a committee was appointed to consider the subject, which, after careful examination, reported, in June, 1866, that vestments and altar-lights, whether legal or not, should not be introduced without sanction of the bishop; that the censuring of persons and things, elevation after consecration, wafer-bread, and presence of non-communicants (except in special cases), were to be discouraged. In deference to this opinion the censuring of persons and things has been in some churches given up. Suits were instituted against several individuals—the rev. A. H. Mackonochie, incumbent of St. Albans, London; the rev. T. B. Simpson, in the diocese of Essex, and others. The points complained of in these are chiefly elevation and the mixed chalice. In the beginning of the year 1866 an opinion was obtained, at the instance of some of the bishops, from five eminent counsel, among whom were sir R. Palmer and sir Hugh (now lord) Cairns, against the legality of all ritualistic innovations (the main grounds of which opinion are given in the *objections* above stated). In reply to this, another opinion was obtained, by the council of the English church union, from nine leading counsel—some of whom have since been raised to the bench—all of whom advise in favor of the legality of vestments, all but two in favor of altar-lights, and all against incense; on the mixed chalice and wafer-bread they are nearly equally divided.

In the session of 1867 the earl of Shaftesbury introduced a bill—founded on the 58th canon of 1603—to limit ecclesiastical vestments to the ordinary surplice and hood, in favor of which more than 600 petitions were presented; while one against it, presented by lord Redesdale, was signed by more than 9,000 clergy and lay communicants. (An earlier memorial, to the archbishop of Canterbury, against any change in the existing law, was signed by more than 40,000 communicant members of the church.) This bill was withdrawn on the appointment by the government of a commission "to inquire into the rubrics, orders, and directions for regulating the course and conduct of public worship, etc., according to the use of the united church of England and Ireland." The commissioners included the archbishops of Canterbury and Armagh, and the bishops of London, St. Davids, Oxford, and Gloucester. They published a report to the effect that "it is expedient to restrain, in the public services of the church, all variations in respect of vesture from that which has long been the established usage of the said church; and that this may be best secured by providing aggrieved parishioners with an easy and effectual process for complaint and redress." The evidence appended to the report supplies much information as to the various practices prevailing, and the widely different views entertained. The general conclusions appear to be that vestments, and probably altar-lights and the mixed chalice, are legal; that an ornate ritual is useful among some classes, and might, with certain safeguards, be allowed; that absolute uniformity is impossible, but that the law might be obeyed a good deal more generally than it is; that the maintenance of the present law, with a wide and liberal interpretation, but limited as a maximum to the ritual of the 2d year of Edward VI., with some recognized ecclesiastical authority to restrain unauthorized variations, would be most for the welfare of the church. The report produced no restraint on the progress of ritualism, and in May, 1873, 60,000 persons of standing and influence presented an address to the two archbishops requesting them to adopt means for checking the growth of ritualistic practices. In April, 1874, a bill for this purpose was introduced in the house of lords by the archbishop of Canterbury, entitled the public worship regulation act. It was adopted by the government, but was opposed in the house of commons by Mr. Gladstone in a series of six resolutions, and notwithstanding a considerable amount of ecclesiastical agitation it became law in August. Its main provision is the appointment of a judge for the trial of ritualistic cases. A complaint against the use of vestments, ornaments, and rites and ceremonies, or the omission of such as are ordained in the book of common prayer, in the churches or burial-grounds of the church of England, may be presented to the bishop of the diocese by an archdeacon or churchwarden, or by three parishioners, members of the church, of full age, and a year's residence in the parish. In the event of the parties not submitting to the directions of the bishop, he shall forward the case for trial by the judge, from whose decision an appeal lies to the privy council.

RITUALISM (*ante*), in one of the many questions to which it gives rise—tl perhaps not one of its recently characteristic aspects—is illustrated in the case of the rev.

G. C. Gorham, an English clergyman, whom the bishop of Exeter refused to "institute" because he held that "spiritual regeneration is not given in baptism—in particular that infants are not made therein members of Christ and children of God—contrary to the teaching of the church of England in her articles and liturgy, the office of confirmation, and the catechism." The arches court of Canterbury having sustained the bishop, an appeal was taken to the judicial committee of privy council. In the opinion of this court Mr. Gorham held that "baptism is a sacrament generally necessary to salvation; but that the grace of regeneration does not so necessarily accompany the act of baptism that regeneration invariably takes place in baptism; that baptism is an effectual sign of grace, by which God works in us, but only in such as worthily receive it; that infants, baptized and dying before actual sin, are certainly saved; but that in no case is regeneration in baptism unconditional." The court held that this view is not contrary to the teaching of the church of England as by law established, and does not afford legal ground for refusing institution. See GORHAM CONTROVERSY, *ante*.

RIVAS, ANGEL DE SAAVEDRA, Duke of, b. Spain, 1791; entered the army and fought through the Spanish war of independence. He participated in the revolution of 1820; was secretary of the cortes in 1821; and was forced to leave the country in 1823. He was minister of the interior in 1836, was again in exile 1837-43, and resided at Naples as ambassador 1843-48. He was afterward ambassador to Paris, and president of the council of state. He won a reputation as a poet by his *Ensayos Poeticos* in 1813, and has since published epics, dramas, and histories. He is the chief of the national school of Spanish literature.

RIVE-DE-GIER, a flourishing manufacturing t. of France, in the dep. of Loire, stands on the Gier, in the middle of the best coal-field in France, 13 m. n.e. of St. Etienne by railway. There is water-communication with the Rhone by means of the canal-de-Givors, which extends from this town to Givors, on the Rhone. South of the town is the immense and well-built basin of Couzon, containing 1,500,000 cubic meters of water for the supply of the canal. Rive-de-Gier was formerly a mere stronghold, surrounded by high walls, and defended by a strong castle; and in 1815 the number of its inhabitants was under 4,000. In 1876 it contained 14,518 inhabitants. Around the town there are about 50 coal-mines in operation; and the principal manufacturing establishments are silk-mills, important glass-works, factories for steam-engines and other machinery, steel factories and foundries.

RIVER. Rivers are the result of the natural tendency of water, as of all other bodies, to obey the law of gravitation by moving downward to the lowest position it can reach. The supply of water for the formation of rivers, though apparently derived from various sources, as from rain-clouds, springs, lakes, or from the melting of snow, is really due only to atmospheric precipitation; for springs (q.v.) are merely collections of rain-water; lakes are collections of rain or spring water in natural hollows, and snow is merely rain in a state of congelation. The rills issuing from springs and from surface-drainage unite during their downward course with other streams, forming rivulets; these, after a further course, unite to form rivers, which receiving fresh accessions in their course from tributaries (subordinate rivers or rivulets) and their feeders (the tributaries of tributaries), sweep onward through ravines, and over precipices, or crawl with almost imperceptible motion across wide, flat plains, till they reach their lowest level in ocean, sea, or lake. The path of a river is called its course; the hollow channel along which it flows, its bed; and the tract of country from which it and its subordinates draw their supplies of water, its basin, or drainage-area. The basin of a river is bounded by an elevated ridge, part of which is generally mountainous, the crest forming the water-shed; and the size of the basin, and the altitude of its water-shed, determine, *ceteris paribus*, the volume of the river. See RAIN. The greater or less degree of uniformity in the volume of a river in the course of a year, is one of its chief physical features, and depends very much on the mode in which its supply of water is obtained. In temperate regions, where the mountains do not reach the limit of perpetual snow, the rivers depend for their increase wholly on the rains, which, occurring frequently, and at no fixed periods, and discharging only comparatively small quantities of water at a time, preserve a moderate degree of uniformity in the volume of the rivers—a uniformity which is aided by the circumstance, that in these zones, only about one-third of the rain-fall finds its way directly over the surface to the rivers; the remaining two-thirds sinking into the ground, and finding its way to spring-reservoirs, or gradually oozing through at a lower level in little rills which continue to flow till the saturated soil becomes drained of its surplus moisture, a process which continues for weeks, and helps greatly to maintain the volume of the river till the next rain-fall. This process, it is evident, is only possible where the temperature is mild, the climate moist, evaporation small, and the soil sufficiently porous; and under these circumstances, great fluctuations can only occur from long-continued and excessive rains or droughts. In the hotter tracts of the temperate zones, where little rain falls in summer, we occasionally find small rivers and mountain torrents becoming completely exhausted; such is often the case in Spain, Italy, Greece, and with the Orange, one of the largest rivers of s. Africa.

In tropical and semi-tropical countries, on the other hand, the year is divisible into one dry and one wet season (see RAIN); and in consequence, the rivers have also a period-

icity of rise and fall, the former taking place first near the source, and, on account of the great length of course of some of the tropical rivers, and the excessive evaporation to which they are subjected (which has necessarily most effect where the current is slow), not making itself felt in the lower part of their course till a considerable time afterward. Thus, the rise of the Nile occurs in Abyssinia in April, and is not observed at Cairo till about midsummer. The fluctuations of this river were a subject of perpetual wonderment to the ancient civilized world, and were of course attributed to superhuman agency; but modern travel and investigation have not only laid bare the reason of this phenomenon, but discovered other instances of it, before which this one shrinks into insignificance. The maximum rise of the Nile, which is about 40 ft., floods 2,100 sq. m. of ground; while that of the Orinoco, in Guiana, which is from 30 to 36 ft., lays 45,000 sq. m. of savannah under water; the Brahmaputra at flood covers the whole of upper Assam to a depth of 10 ft., and the mighty Amazon converts a great portion of its 500,000 sq. m. of silvas into one extensive lake. But the fluctuations in the rise of the flood-waters are surpassed by some of the comparatively small rivers of Australia, one of which, the Hawkesbury, has been known to rise 100 ft. above its usual level. This, however, is owing to the river-beds being hemmed in by lofty abrupt cliffs, which resist the free passage of a swollen stream.

The increase from the melting of snow in summer most frequently occurs during the rainy season, so that it is somewhat difficult to determine, with anything like accuracy, the share of each in producing the floods; but in some rivers, as the Ganges and Brahmaputra, the increase from this cause is distinctly observable, as it occurs some time after the rains have commenced, while in the case of the Indus it is the principal source of flood. When the increase from melted snow does not occur during the rainy season, we have the phenomenon of flooding occurring twice a year, as in the case of the Tigris, Euphrates, Mississippi, and others; but in most of these cases the grand flood is that due to the melting of the snow or ice about the source. In illustration of the enormous variation in the volume of rivers subject to periodical rise and fall, we shall give a few instances in which the minimum and maximum delivery per second have been ascertained:

DELIVERY IN CUBIC FEET PER SECOND.

	Minimum.	Maximum.	Average for a year.
Nile (at Assouan)	24,000	362,000	171,000
Ganges,	36,000	491,000	141,000
Irawady,	81,000 (?)	1,000,000 (?)	350,000
Brahmaputra,	146,000	1,800,000 (?)	520,000

The advantages of this periodical flooding in bringing down abundance of rich fertile silt—the Nile bringing down, it is said, no less than 140 millions of tons, and the Irrawady 110 millions of tons annually—are too well known to need exposition here. Islands are thus frequently formed, especially at a river's mouth (see DELTA). Permanent and capacious lakes in a river's course have a modifying effect, owing to their acting as reservoirs, as is seen in the St. Lawrence; while the Red river (N.) and others in the same tract, inundate the districts surrounding their banks for miles. In tropical countries, owing to the powerful action of the sun, all rivers whose source is in the regions of perpetual snow, experience a daily augmentation of their volume; while come in Peru and Chili, being fed only by snow-water, are dried up regularly during the night.

The course of a river is necessarily the line of lowest level from its starting-point, and as most rivers have their sources high up a mountain slope, the velocity of their current is much greater at the commencement. The courses of rivers seem to be partially regulated by geological conditions of the country, as in the case of the San Francisco of Brazil, which forms with the most perfect accuracy the boundary-line between the granitic and the tertiary and alluvial formations in that country; and many instances are known of rivers changing their course from the action of earthquakes, as well as from the silting up of the old bed. The inclination of a river's course is also connected with the geological character of the country: in primary and transition formations, the streams are bold and rapid, with deep channels, frequent waterfalls and rapids, and pure waters, while secondary and alluvial districts present slow and powerful currents, sloping banks, winding courses, and tinted waters: the incline of a river is, however, in general very gentle—the average inclination of the Amazon throughout its whole course being estimated at little more than 6 in. per m., that of the lower Nile less than 7 in., and of the lower Ganges about 4 in. per mile. The average slope of the Mississippi throughout its whole length is more than 17 in. per m., while the Rhone is, with the exception of some much smaller rivers and torrents, the most rapid river in the world, its fall from Geneva to Lyons being 80 in. per m., and 32 in. from Lyons to its mouth.

The velocity of rivers does not depend wholly on their slope; much is owing to their depth and volume (the latter being fully proved by the fact that the beds of many rivers remain unaltered in size and slope after their streams have received considerable accessions, owing to the greater rapidity with which the water runs off); while bends in the course, jutting peaks of rock or other obstacles, whether at the sides or bottom, and even the friction of the aqueous particles, which, though slight, is productive of perceptible effect, are retarding agencies. In consequence, the water of a river flows with different

velocities at different parts of its bed; it moves slower at the bottom than at the surface, and at the sides than the middle. The line of quickest velocity is a line drawn along the center of the current, and in cases where this line is free from sudden bends or sharp turns, it also represents the deepest part of the channel. The average velocity of a river may be estimated approximately by finding the surface-velocity in the center of the current by means of a float which swims just below the surface, and taking four-fifths of this quantity as a mean. If the mean velocity in feet per minute be multiplied by the area of the transverse section of the stream in sq. feet, the product is the amount of water discharged in cubic feet per minute. According to sir Charles Lyell, a velocity of 40 ft. per minute will sweep along coarse sand; one of 60 ft. fine gravel; one of 120 ft. rounded pebbles; one of 180 ft. (a little more than 2 m. per hour), angular stones the size of an egg. The rate of its progression, and a general description of the erosive action of rivers, will be found under WATERFALLS. "Rivers are the irrigators of the earth's surface, adding alike to the beauty of the landscape and the fertility of the soil; they carry off impurities and every sort of waste débris; and when of sufficient volume, they form the most available of all channels of communication with the interior of continents. . . . They have ever been things of vitality and beauty to the poet, silent monitors to the moralist, and agents of comfort and civilization to all mankind." By far the greater portion of them find their way to the ocean, either directly or by means of semi-lacustrine seas; but others, as the Volga, Sir-Daria (Jaxartes), Amu-Daria (Oxus), and Kur (Araxes), pour their waters into inland seas; while many in the interior of Asia and Africa—as the Murghab in Turkestan, and the Gir in the s. of Morocco—"lose themselves in the sands," partly, doubtless, owing to the porous nature of their bed, but much more to the excessive evaporation which goes on in those regions. The following are a few of the chief rivers in each continent, with the lengths of their courses in English statute m., and their drainage areas in English geographical sq. m. (the Thames is given as a standard of comparison):

EUROPE.

In law, when a river not navigable forms the boundary of property, it is taken to belong in equal halves to the proprietors on opposite sides; and when both sides belong to one owner, then the whole of the bed belongs to him. In the common case where it is a boundary, an imaginary line called the *medium filium*, runs down the middle, and all the bed of the river on one side belongs to the proprietor of the land on that side. This rule refers to the soil under the water, which is as absolutely the property of the riparian owner as the banks of the river themselves. As regards the water, it is true that the riparian owner on his side of the middle line has not the absolute property of the water itself, but he can use it to a limited extent—as, for example, to water his cattle, to supply the wants of his house, etc. The right of abstracting quantities of water is limited to this extent, that if, by taking more than the usual quantity required for necessary purposes, the rights of other riparian owners further down are materially injured, then the latter can bring an action to recover damages for such injury. Thus, if a riparian owner or his tenant had a mill on the river which had existed thirty or forty years, and a riparian owner further up has materially diminished the volume of water, an action of damages will be competent. So one owner cannot alter the bed or embank the river so as to injure other owners. With regard to fishing, each riparian owner has a right to fish in his half of the river, and to catch all he can find there, subject to the restrictions of the fishery laws. (Paterson's *Fishery Laws of the United Kingdom*.) In Scotland, the riparian owner, unless he has a grant from the crown, cannot meddle with salmon so far as net-fishing is concerned, though he may fish for salmon with the rod. It follows that a riparian owner, when fishing with the net or rod, cannot go beyond his own half of the stream; and if he cast his line beyond the mid-stream, he would be liable to an action of trespass. But it is usual for opposite riparian owners to allow each other

* Including basin of Brahmaputra.

† Including basin of Menam.

to fish the whole stream, for this is more convenient to both parties. The restrictions as to the times of fishing and the size of nets are stated under FISHERY. Where a river is navigable, the soil belongs to the crown, and the public have *primâ facie* a right to fish in it, though individuals may prove a title to a several or exclusive fishery there, but the burden of proof lies on such individuals. As between navigation and fishing, the right of navigation is paramount, and the fisherman must yield to the navigator.

The *poisoning of rivers* has begun of late years to cause serious concern, in consequence of the extension of manufactures, many of which are situated on the banks of streams, and use such streams as a drain or sewer. No person has a right so to poison or pollute a stream, and if he do so, any of the persons whose lands abut on the stream lower down may bring an action to recover damages. But if these tolerate the nuisance without complaint for twenty, or, at all events, forty years, they are forever afterward precluded from complaining. Hence, in most cases, the manufacturers who pollute streams must be able to prove that they have been in the practice of doing so without challenge for twenty, or at most forty years. As, therefore, the law was defective in guarding salmon-rivers from this danger, the English salmon fishery act enacted that all persons who poison streams without a legal right of this kind shall be liable to fine; and, moreover, even when they have the legal right, they must prove that they have used all reasonable means to counteract the ill effect of their refuse. Whoever unlawfully or maliciously puts lime or other noxious material in a pond or water with intent to destroy the fish therein, commits a misdemeanor, and may be sentenced to seven years' penal servitude. In Ireland and Scotland, the law does not materially differ from that of England as to poisoning rivers and streams; and it is an offense to put lime into streams to kill fish.—Paterson's *Fishery Laws of the United Kingdom*. Besides the offenses declared by the salmon acts of the United Kingdom, there are also similar penalties for poisoning waters, imposed by the water-works clauses act, 10 Vict. c. 17, s. 61; the public health act, the nuisances removal and other sanitary acts. See also the rivers pollution prevention act, 1876.

RIVER-CRAB, *Thelphusa*, a genus of crabs inhabiting fresh water, and having the carapace quadrilateral, the antennæ very short. One species (*T. depressa*), the *grancio* of the Italians, is very common in the south of Europe, and is often figured on ancient Greek medals. It was in ancient times as it still is, an esteemed article of food. It is much used in Italy during Lent. It inhabits muddy lakes and slow rivers. In some it absolutely swarms. It can be kept alive in a damp place for a long time. It is often brought to market tied on strings, at such distances as to prevent fighting and mutilation. This crab spends the winter deeply imbedded in the mud.—Other species are common in warm countries. *T. cunicularis* is very abundant on the ghats of the Deccan, in India, burrowing in the ground, and running about among the long grass. It "runs with considerable swiftness, even when encumbered with a bundle of food as big as itself; this food is grass, or the stalks of rice; and it is amusing to see the crabs sitting, as it were, upright, to cut their hay with their sharp pincers, and then waddling off with their sheaf to their holes, as quickly as their side-long pace will carry them."

RIVER-TERRACES occur in some valleys, and exhibit the action of the river in scooping out its bed when it flowed at a higher level than it does now. The terrace consists of a more or less steep cliff, a few feet, or it may be yards high, with a flat terrace on a level with the top of it. The cliff corresponds to the present bank, and the terrace to the alluvial plain through which the river runs. The cliffs and terraces are repeated several times in some river-basins, and they frequently correspond on the two sides of the valley. They follow the course of the river, sloping downward, with an inclination similar to the descent of the stream. They differ in this respect from the parallel roads formed by standing water. See GLENROY.

RIVES, JOHN C., 1796-1864; b. Ky.; self-educated, cashier of a bank in Illinois, clerk in the office of the 3d auditor in Washington, 1824. Soon after the election of pres. Jackson, associated with Francis P. Blair, he assumed the management of the *Congressional Globe*, exerting a wide political influence. He was distinguished for patriotism and practical philanthropy.

RIVES, WILLIAM CABELL, 1793-1868; b. Va.; educated at Hampden-Sidney and William and Mary colleges, and admitted to the bar. He was a member of the state constitutional convention in 1816, of the state legislature 1817-19 and 1822, and of congress 1823-27. He was minister to France 1829-32, when he was elected to the U. S. senate, from which he resigned in 1834. He was re-elected in 1835, and remained in the senate till 1845. He was again minister to France 1849-53, a member of the peace conference at Washington in 1861, and afterward of the confederate provisional congress. He published *Life and Times of James Madison*.

RIVET, a metal pin for connecting two plates of metal or other material together. The rivet is put through holes in both plates, and the projecting ends are then beaten down so as to represent the head of a nail on each side, and thus hold the plates in close contact. Rivets are of most essential importance in boiler and tank making, and in building iron ships. They are often put through the holes and beaten down while red-hot, in order that the contraction of the rivet as it cools, may produce more intimate

contact of the plates. The principle of the *riveting-machine* is simply the bringing a powerful lever to bear upon the head of the rivet, so that the smith can hammer upon the other and softened end without displacing it.

RIVIERA (sea-shore, coast), a term applied to the narrow strip of coast-land bordering the gulf of Genoa from Nice to Spezzia. Between Nice and Genoa it is called the Riviera di Ponente, or western coast, and the part from Genoa to Spezzia, the Riviera di Levante, or eastern coast. It abounds in the most striking scenery, uniting beauty with grandeur. The modern road that traverses it was a work of formidable difficulty; it was begun under French rule, and finished by the Sardinian government after the fall of Napoleon. The old road, which was dangerous and almost impracticable, was known as the Corniche road and this name is often applied to the modern one. A railroad throughout the whole length of the Riviera has recently been completed.

RIVINGTON, JAMES, about 1724-1802; b. London; came to Philadelphia 1760; in 1761, to New York, where he established himself in the book trade, and in 1773 commenced the publication of the *New York Gazetteer*. In 1775 he espoused the royal cause; and capt. Isaac Sears, of the patriot army, "with a troop of horse," made a raid on his office, destroyed his press, and run his types into bullets. He made a journey to England, returned while the British ruled New York, and, provided with a new press, commenced business again as king's printer. His paper came out at first as *Rivington's New York Loyal Gazette*, afterward as *The Royal Gazette*. In 1781 he informed against the British, and remained in New York after the evacuation, issuing his paper as *Rivington's New York Gazette and Universal Advertiser*. The last number appeared in 1783.

RIVOLI, a t. of northern Italy, on the right bank of the river Dora, 8 m. w. of the city of Turin. Pop. 5,600—Rivoli must not be confounded with the village of the same name in the province of Verona, near which took place in 1797 one of Napoleon's most decisive victories over the Austrians.

RIYAD, or **RIAD**, a city in central Arabia, capital of the Wahabite kingdom and the sultanate of Nedjed, province of Aared; pop. 40,000. It is built on an extensive open plain in the midst of a well-cultivated region shaded by palm groves. In the n.e. are the official quarters, the royal palace, and the residences of the nobility; in the s.w. are the homes of the Wahabites. In the center of the city is a large square containing the market-place and the great mosque, capable of holding 2,000 persons. The city contains 30 smaller mosques.—It is a resting-place for pilgrims on the way from Persia to Mecca and Medina. It has been the capital of the Wahabites since the overthrow of Deraych by Ibrahim Pasha. All citizens are obliged to conform to Wahabite rules.

RI'ZAH, a t. of Asiatic Turkey, in the pashalic of Trebizond, on the coast of the Black sea, 40 m. e. from Trebizond, with considerable trade, and manufactures of fine hempen fabrics. Pop. 30,000.

RIZZIO, DAVID, an Italian of considerable ability and accomplishments, who, in the reign of Mary Stuart, queen of Scots, came to Edinburgh in the train of the ambassador from Savoy. His first employment at court was as a musician; but his skill and fidelity led Mary to advance him to the post of her French secretary about the time of her marriage with Darnley; and in this situation he was believed to possess considerable influence over the queen. His advancement was distasteful to the nobles in general, but more especially to the party of the reformers, who suspected him of intriguing with the papal court. He became obnoxious on other grounds to Darnley and his father, the earl of Lennox. The former, who had for a time been on the most friendly footing with him, was easily led to believe not merely that he was the real obstacle to his favorite design of having the crown settled on him and his heirs, but also that he had supplanted him in the affections of the queen. In this belief he entered into a compact with the leaders of the Protestant party—including Murray, Ruthven, Morton—to assassinate Rizzio, and slay even in the queen's palace and presence whoever opposed them. Darnley formally bound himself to prevent the attainder of the conspirators, and procure their pardon, and to support and advance the Protestant faith, while the conspirators in return obliged themselves to procure the wished-for settlement of the crown in his favor. Accordingly, on Mar. 9, 1566, when Mary, then seven months with child, was sitting at supper in a small cabinet adjoining her bedroom, at Holyrood, attended by the countess of Argyle, the commendator of Holyrood, Beaton, master of the household, Arthur Erskine, captain of the guard, and Rizzio, the king led the conspirators up a secret stair, while the earl of Morton, with a troop of soldiers, seized the gates of the palace. Led by the king, the conspirators burst into the cabinet, overturned the table, and threw themselves on Rizzio, who sprang for protection behind the queen. Ruthven drew his dagger; Ker of Fawdonside, it is said, held a pistol to the queen's breast; while George Douglas, natural son to the earl of Angus, snatching the king's dagger, stabbed Rizzio over the queen's shoulder, and dragging him from the cabinet, dispatched him in a pool of blood in the adjoining apartment, with fifty-six wounds. This murder was the first of the series of tragic events in which Mary queen of Scots was involved. John Knox, in his *History of the Reformation*, characterizes it as a "a just act, and most worthy of all praise."

ROACH, *Leuciscus rutilus* (see **LEUCISCUS**), a fish of the family *cyprinidae*, very plentiful in many of the lakes, ponds, and slow-running rivers of England and of the s. of Scotland. It is also found on the continent of Europe. It is seldom more than a pound in weight, although it has been known to reach five pounds. The upper parts are dusky-green with blue reflections, passing into silvery-white on the belly, the fins more or less red. The roach is gregarious, and the shoals are often large. It is partially migratory, ascending rivers from lakes—as from Loch Lomond—to spawn. It is not much esteemed for the table. It is generally caught with bait, but sometimes with a small fly.

ROAD, in the law of Scotland, is used in the same sense as highway (q. v.) in England. Road trustees are persons who are authorized by act of parliament to make and manage a particular road, and levy tolls from the public to pay the expense. In England road trustees necessarily mean the trustees of a turnpike road, on which alone a toll is leviable, the ordinary highways being repairable by the parish, and under the management of the highway surveyor appointed by the parish. In Scotland, by the earlier statutes, public roads were placed under the general management of the commissioners of supply and justices of the peace; but later local statutes authorized trustees to apportion statute labor amongst the local inhabitants for the repair of highways not turnpike. At length general road acts were passed, 1 and 2 Will. IV. c. 43 to 25 and 26 Vict. c. 105, and the local acts now incorporate the last general act. Practically the roads of each county are under a separate statute, which prescribes the modes of management of the roads.

ROAD, LAW OF THE. See **RULE OF THE ROAD.**

ROADS AND ROAD-MAKING. Roads form a primary element in the material advancement of a nation, being essential to the development of the natural resources of the country. Canals and railways have no doubt, in modern times, superseded to some extent the common highways; still these retain their importance were it only as essential auxiliaries.

The Romans were great constructors of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except where some natural barrier made it impossible, the Roman roads were almost invariably in a straight line; probably because the chief means of transport then in use were beasts of burden, and not wheeled vehicles, which made the preservation of the level of less consequence. The substantial character of the Roman roads is well demonstrated by the fact that they have in some instances borne the traffic of 2,000 years without material injury. The plan of construction was pretty uniform, being that described in the article on the **APPIAN WAY**, one of the earliest and most famous of them. They varied in breadth from 15 to 8 ft., and had often raised footpaths at the sides and blocks of stones at intervals to enable travelers to mount on horseback.

The roads made by the Romans in Great Britain gradually fell into decay, and the attempts that were now and then made to repair them were insufficient to prevent England falling into a worse state with respect to its highways than most other European countries. In 1285 one of the earliest laws on the subject of roads was passed. It directed that all trees and shrubs be cut down to the distance of 200 ft. on either side of roads between market-towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III. in 1346 on roads which now form part of the streets of London. In 1555 an act was passed requiring each parish to elect two surveyors of highways to keep them in repair by compulsory labor; at a later period, in place of the compulsory labor the "statute labor-tax" was substituted. But long after this, the roads even in the neighborhood of London were wretchedly bad, and in the other parts of the country they were still worse. For the most part, indeed, they were mere horse-tracks; the chief advantage in following them being that they led along the higher grounds and so avoided bogs. These trackways were usually impassable in winter; being narrow, and in many places so deep and miry as to be liker ditches than roads. So late as 1736 the roads in the neighborhood of London were so bad that in wet weather a carriage could not be driven from Kensington to St. James's palace in less than two hours, and sometimes stuck in the mud altogether. Much curious information on the state of the roads and means of conveyance in England during the long period which elapsed from the decay of the Roman roads to the middle of the last century will be found in vol. i. of *Smiles's Lives of Engineers*.

In laying out a new line of road the skill and ingenuity of the engineer are taxed to make the gradients easy with as little expense as possible in excavating and embanking (see **EMBANKMENT**), and to do this without deviating much from the direct course between the fixed points through which the road must pass. In order to do this an accurate survey of the tract, including the relative levels of its different parts and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which require the greatest engineering skill.

The importance of easy gradients or inclinations in roads is well understood in a general way; but it gives a more precise idea of it to state that while, for example, the force requisite to draw a wagon weighing 6 tons along a level macadamized road is 264 lbs., on a road with an ascent of 1 in 70 the force required is 456 lbs., i. e., $\frac{1}{70}$ part of 6

tons over and above 264 lbs. The greatest declivity which can be given to a road, so that horses may move down it with safety in a fast trot, varies according to its nature; for paved roads, 1 in 63—for those which are macadamized, 1 in 35—and for those laid with gravel, 1 in 15, have been considered the limit.

What is the best transverse form for a road is a much debated question among engineers. All agree that it should be higher in the middle than at the sides, but some think it should be much higher than others. As a road can be better kept clear of water by a slight inclination in the direction of its length than by any form which can be given to its cross-section it seems preferable that it should be as nearly flat as possible, because every part of its breadth will then be equally available for traffic; whereas it is almost necessary to keep on the center of a highly convex road, and consequently wear deep furrows there, by confining the wheels and horses to pretty much the same track. An approved form of road has a slope of 1 in 30, with a few feet in the center on a flat curve.

Different opinions are also held as to whether the bed upon which the road is to be formed should be flat or rounded; those who prefer it flat considering that there should be a greater depth of material at the center than at the sides, while others think that the depth should be uniform.

As respects the construction of the road itself, the first point to consider is the foundation. The majority of roads have no artificial foundation. In such cases the surface on which the road-material is to be laid is generally made as solid as possible by means of efficient drainage, and by rolling and beating wherever there are embankments formed. It is the question whether or not a road should have a foundation of rough pavement below the broken stone covering, which is the essential point of difference between the two great rival systems of Telford and Macadam. Telford considered it of great importance that there should be such a foundation. He made it of stones varying in depth from 9 in. at the center to 3 in. at the sides of the road, these being set with their broadest edge downward, and no stone being more than 4 in. broad upon the upper edge; upon these were placed a coating of broken stones not exceeding 6 in. in thickness. The Glasgow and Carlisle and the Holyhead roads are excellent examples of the enduring character of those made on Telford's plan.

In our biographical notice of Macadam (q.v.) will be found a reference to his method of road-making. Suffice it here to say that he preferred a yielding and soft foundation to one which was rigid and unyielding, so that even on boggy ground, if it were but firm enough to allow of a man walking over it, he considered an artificial bottoming quite unnecessary. His roads were formed entirely of angular pieces of stones, of such a size as to pass freely through a ring 2½ in. in diameter. This plan has now fewer advocates than Telford's, or than the one subsequently proposed by Mr. Thomas Hughes, where a concrete of gravel and lime is employed for the foundation of the road. But experience has shown that Macadam's plan of employing angular pieces of stone is superior to every other as a mere covering for roads, whether they have an artificial foundation or not. So popular at one time was the system of macadamizing, that expensively paved streets, such as that between Edinburgh and Leith, were torn up to be reformed on the new plan. Dublin has been instanced as an example of the failure of Macadam's plan for the streets of a populous city. There the macadamized streets are in winter constantly covered with mud, and in summer profuse watering is required to keep them from being overwhelmed with dust. It is curious, however, that the French road-engineers have, in recent years, come to the conclusion that a covering of broken stone alone is sufficient on the most frequented roads and under all but the very heaviest traffic.

With regard to the kind of stone suitable for covering roads, granite and the different kinds of greenstone and basalt, ordinarily called whinstones, are the only kinds admissible. Sandstone is too easily crushed, limestone is objectionable from its slight solubility in water. The stone employed should be tough as well as hard. Flint is hard enough, but it is brittle, and easily crushed to powder. The object is to get it to bind into a firm mass, and not to roll about, after it has been laid down for some time.

Little need be said about the drainage of roads, notwithstanding its great importance, because it will be apparent from what has been said, that it is in great part secured by the plan on which a road is made. What further drainage a road requires, can, in many situations, be effected by ditches on either side. Where this is not possible, as in the case of portions situated in cuttings more or less deep, proper drains require to be constructed. In such circumstances a drain is either made down the center, with branch drains from the sides running into it; or drains are formed along the sides, with gratings at proper intervals to take in the surface-water. If the ground beneath the road is composed of clay or of any kind of wet soil, under drainage must be resorted to; and of course, wherever there are footpaths, small drains require to be placed under them, if there is no other means of carrying off the water from the channel between them and the road.

ROADS AND ROAD MAKING (*ante*). The Telford differs from the Macadam road in having beneath the broken stone, which is but 6 or 7 in. in depth, a pavement of

stone blocks, 6 or 7 in. high and 4 or 5 wide. Sometimes a layer of rubble stone is laid as a foundation for these courses. Both the Macadam and Telford pavements need frequent superficial repairs in heavily traveled streets to prevent the forming of ruts. For ordinary use the Telford seems unsurpassed. The Belgian form of stone pavement is much improved by having the blocks as much as 10 in. deep, and some inches wider in their greatest direction, that at right angles to the street line, and by setting them on a concrete foundation. Their lines, however, are best set obliquely to the line of the street. Wooden pavements are liable to crushing of the fiber and to decay, even though creosoted, and in the end are more expensive than good stone or asphalt. They are now disused. The stone pavement possesses the advantage of greater durability than the asphalt, and is less slippery after rain. On the other hand it is far noisier, and the joints and inevitable depressions hold dust, water, and refuse; and hence for both reasons is open to objection on hygienic grounds. The asphalt material is obtained from the natural asphalt rock of Switzerland or by refining bitumen. This form of pavement has been undeservedly brought into disrepute by cheap imitations. For an ordinary carriage road the asphalt is excellent, but is scarcely fitted for the heaviest business travel, or for sharp ascent.

ROANE, a co. in e. Tennessee drained by the Clinch, Holston, and Tennessee rivers, crossed by the Cincinnati Southern railroad; about 550 sq. m.; pop. '80, 15,237—15,089 of American birth. The surface is hilly, and heavily timbered. The soil is moderately fertile. The principal productions are corn, oats, and cattle. Iron and coal are found. Co. seat, Kingston.

ROANE, a w. co. of W. Va., drained by the Pocotaligo river which rises here, and by branches of the Little Kanawha and De Kalb rivers; 450 sq. m.; pop. '80, 12,184. The surface is hilly and in some parts mountainous, and the northern part is covered with large forests, in which the sugar maple abounds; the soil is fertile. The chief productions are flax, tobacco, grain, hay, wool, and sorghum molasses. Sheep and swine are raised. It contains iron ore and coal. Co. seat, Spencer.

ROANNE, a thriving t. of France in the department of Loire, and, after St. Etienne, the most important town in the department for industry and commerce, stands on the left bank of the Loire, which is here navigable, 52 m. by railway n.w. of Lyon. Its streets are wide, and its houses handsome. The chief structures are the bridge over the Loire, the public library, and the college buildings. There are important manufactures of muslins, calicos, and woolen and other fabrics. Ship-building is carried on at the several dockyards. Roanne is also a most important entrepôt for commerce between the n. and s. of France. Pop. '76, 21,472. Around and within the town are to be found numerous traces of the ancient rule and civilization of the Romans.

ROANOKE, a river of Virginia and North Carolina formed by the union at Clarksville, Virginia, of the Din and Staunton rivers, which rise in the Alleghanies, flows s.e. through the north-eastern portion of North Carolina, and empties into Albemarle sound. It is navigable for large vessels to Weldon, head of tide-water, 150 m.; its length is 260 miles. In 1861 Albemarle island, at its mouth, and Plymouth, were taken by the Federal gunboats.

ROANOKE, a co. in s. Virginia, drained by Staunton river and Craig's creek, traversed by the Atlantic, Mississippi, and Ohio railroad; about 300 sq. m.; pop. '80, 13,105—4,833 colored. The surface is level except in the s.e., which is intersected by the Blue Ridge. The soil is fertile. The principal productions are corn, wheat, oats, and live stock. Co. seat, Salem.

ROARING, a disease of the air-passages of the horse, is characterized by a grating, roaring noise, most noticeable during inspiration, and when the animal is galloped in heavy ground. It usually depends upon wasting of some of the muscles of the larynx; is apt to result from frequent attacks of cold, from strangles, inflammation of the neck-vein, or from tight reining. It constitutes unsoundness, unfits the animal for the satisfactory performance of fast work, is apt gradually to become worse, when a sharper whistling noise is produced, and is seldom curable. In recent cases a dose of physic should be given, a smart blister applied to the throat, or a seton inserted. As in broken-winded subjects the breathing is much less distressed when the horse is fed and watered several hours before being required to exert himself. He should have a liberal supply of good oats, but only a limited allowance of hay, which should be given damped. In bad cases, tracheotomy may be performed, and a pipe inserted in the windpipe, with which we have known heavy draught-horses work regularly for years.

ROASTING. All the apparently numerous forms of cookery may be reduced to two, viz., roasting and boiling (q. v.). In this general sense, roasting may be held to include broiling, baking, and all other processes which consist essentially in the exposure of food to the action of heat without the presence of any fluid excepting its own natural juices. Chemistry and experience alike teach that the first application of heat in roasting should be powerful and rapid, so as to form an external wall, by hardening the skin, and coagulating the superficial albuminous juices, and thus retain the deep-seated juices as much as possible within the meat. This external crust is usually formed in about 15 minutes, after which the meat should be removed to a greater distance from the fire, and

allowed to cook slowly. The evaporation of the internal juices may be further restrained by the free and early application of flour—a process known as dredging. The loss of weight in roasting is greater than that in boiling; but it is mainly due to the melting out of fat and the evaporation of water, while the nutritive matter remains in an easily digestible form in the interior. Rules for calculating the time a joint of given weight requires for roasting, are given in all the ordinary cookery-books. Unless the roasting is continued long enough, those parts which are nearest the center do not become hot enough to allow the albuminous matters to coagulate, and hence they appear red, juicy, and *underdone*, as it is commonly called. The exact nature of the chemical changes which occasion the peculiarly agreeable odor of roasted meat is still unknown.

ROB, the Spanish name of a conserve of fruits. It is derived from the Arabic *roob*, signifying the juice of fruit, boiled to a sufficiently thick consistency to keep, and is supposed to have been taken from its similarity to the saccharine pulp of the locust-pods, called *al-garoba* by the Moors. The juices of strawberries, raspberries, gooseberries, currants, etc., are boiled with sugar until they form *robs*, and are in that state used for flavoring drinks, etc.

ROBBERY is larceny from the person, preceded by violence or the fear of violence. By the present statutory law of England and Ireland, 24 and 25 Vict. c. 96, whoever robs a person is guilty of felony, and liable to penal servitude, not exceeding 14 years, and not less than 3 years; or to imprisonment not exceeding 2 years, with or without hard labor. If, on the trial for robbery, it appear to the jury that the party charged did not commit the crime of robbery, but committed an assault with intent to rob, the party shall not be acquitted, but shall be found guilty of the assault with intent to rob. The punishment of an assault with intent to rob is penal servitude for 3 years, or imprisonment not exceeding 2 years. To constitute simple robbery, there must be what is called asportation, or a seizure of the goods. Thus, where the thief, in pulling a purse out of a pocket, could not disentangle it from the keys in the pocket, and so the purse never left the pocket, it was held not robbery; but where a thief detached a lady's earring, which became lost in the curls of her hair, it was held to be robbery. In the law of Scotland robbery also means the violent or forcible taking away of property from the person, while stouthrieff means the same offense in or near a dwelling-house.

ROBBERY (*ante*) is larceny from the person accompanied with violence or putting in fear. The thing taken must be of some value, otherwise the violence or putting in fear would be only an assault. The property need not be taken directly from the person or actual manual possession of the owner; it is sufficient if it be taken in his presence and violence be shown him, or he be put in fear. The violence and putting in fear must be before the taking. For if a man steal a thing, and then keep possession of it by threats of violence or putting in fear, the subsequent violence will not make the larceny robbery. The violence need not be offered to the person; but if offered to a person connected with him by blood or marriage, and money be extorted for the purpose of protecting such relative from violence, the offense will be robbery. A threat to accuse a person of a disgraceful crime is a putting in fear, and to obtain money by that means is robbery. The fear must be sufficient to entirely master the will, so that the person through fear or confusion is unable to oppose the extortion. The giving up of the property need not be the immediate result of the violence, or exactly coincident with it. The robber must get actual possession of the property, but such possession need not last, so that the restoration of the property will not make the crime other than robbery. A sudden taking from the person or hand by surprise without a struggle or injury to the owner, will not, as a rule, constitute robbery. Robbery was anciently punished by death, but the penalty in England and the United States is now imprisonment for life or years.

ROBERT I. (of Scotland). See BRUCE.

ROBERT II., King of Scotland, 1371–90, was b. March 2, 1316, only two years after the battle of Bannockburn. His father was Walter Stewart, and his mother, Marjory, only daughter of Robert the Bruce. Robert lost both his parents in infancy. During the disastrous reign of his uncle, David II., he was one of the most prominent of the patriotic nobles of Scotland, acting as regent, or joint-regent, during the minority and exile of his sovereign. He was present at the battles of Halidon hill (q.v.) and Neville's Cross (see BRUCE, DAVID). On the death of David he obtained the crown, and became the founder of the Stuart dynasty, in virtue of the law of succession adopted by the council of estates held at Ayr in 1315. Partly from disposition, and partly from the infirmities of age, Robert proved a peaceable, though not exactly a pusillanimous ruler. Such wars as were waged with England were not only conducted, but actually organized, by his powerful and intractable barons, particularly the earls of Douglas, Mar, March, and Moray, who shaped the policy of the country very much according to their pleasure. The misery inflicted on both sides of the borders by the raids of these warlike chiefs, and the reprisals of the English wardens—the Percies, and others—was frightful; famine and pestilence became chronic; but the most celebrated incidents of Robert's reign were the invasions of Scotland by an English military and naval force under the command of the duke of Lancaster ("Old John" of Gaunt, time-honored Lan-

caster"), in 1384, and again by king Richard II. himself, in 1385, which wasted the land as far as Edinburgh and Fife; and the grand retaliatory expedition of the Scotch in 1388, when two armies invaded and devastated England: the larger under the earls of Fife and Strathearn, Archibald Douglas, surnamed the Grim, lord of Galloway, and the earls of Mar and Sutherland, penetrating by way of Carlisle; the smaller, under James earl of Douglas ("the doughty Douglas"), and the brothers Dunbar, earls of Moray and March, by way of Northumberland. Both were completely successful. What gives a special interest to the movements of the smaller body is the fact that on its return home it fought and won, though at the expense of the life of its gallant leader, the brilliant battle of Oterburn, July 21, 1388. See CHEVY CHASE. Robert died at his castle of Dundonald, in Ayrshire, April 19, 1380. According to Buchanan (not, however, a very accurate historian), he labored honestly to suppress the internal disorders of the country; but like most of the Stuarts, he was profligate in his habits. His favorite mistress, Elizabeth Mure of Rowallan, became his second wife.

ROBERT III., King of Scotland, son of the preceding, was b. about 1340. His baptismal name was John, but this name, for reasons not ascertained, was changed on his accession to the throne in 1390, by an act of the Scottish estates or parliament. His imbecility as a ruler virtually placed the reins of government in the hands of his ambitious brother, Robert, earl of Menteith and Fife, whom, in 1398, he created duke of Albany—during whose regime the Scottish barons first began to exercise that anarchic and disloyal authority, which, in the reigns of the first three Jameses, threatened to destroy the power of the sovereign altogether. The principal events in Robert's reign were the invasion of Scotland, in 1400, by Henry IV. of England, who, at the head of a large army, penetrated as far as Edinburgh, but did not inflict much injury on the country, more, however, from clemency than impotence; and the retaliatory expedition of the Scotch, in the following year, under Archibald Douglas, son of the grim earl, which resulted in the terrible disaster at Homildon hill (q.v.). Robert had two sons, the eldest of whom was David, duke of Rothesay, a youth not destitute of parts, but shockingly licentious. As long as his mother lived he kept within bounds, comparatively speaking; but after her death, says Buchanan, "he gave an unbridled license to his passions; laying aside fear and shame, he not only seduced married ladies and virgins of good family, but those whom he could not entice, he forced to his embraces." Albany received orders from the king to act as his guardian, and after a short time, starved him to death in his castle of Falkland—for which he underwent a mock trial by his own creatures, and was of course declared innocent. Sir Walter Scott has given the traditional version of this tragedy in his romance, *The Fair Maid of Perth*. Robert now became anxious for the safety of his younger son, James; and after consulting with Wardlaw, archbishop of St. Andrews, he resolved to send him to France; but, while proceeding thither, the vessel in which he sailed was intercepted by an English cruiser, and James was taken prisoner in 1405. When his father received the melancholy news, he gave way to paroxysms of grief, and died at Rothesay in the following year.

ROBERT II., surnamed **THE DEVIL**, was a son of Richard II., and succeeded his brother Richard III. as duke of Normandy in 1087. He combined cruelty and unscrupulousness with energy, audacity, and a handsome figure, which gave origin to his surname Robert the Devil. He regulated his frontiers, humiliated his vassals, and conquered districts from his neighbors; espoused the cause of count Baldwin IV. of Flanders against his sons; of Henry I. of France against his mother; and of his nephews, Alfred and Edward of England, against Canute of Denmark. At the height of his successful career he fell into a state of despondency. He traveled to Rome with a retinue of great splendor, but the next year went to Constantinople with an unpretentious train, and in 1035 made a pilgrimage to the Holy Land to seek consolation and atone for the wild life he had led. He died suddenly after his return at Nicæa, and was succeeded by his son, William the conqueror of England. See Depping, *Histoire de Normandie*; and A. Deville, *Notice Historique sur Robert le Diable*, 1836.

ROBERT, LOUIS LEOPOLD, 1794-1835; b. in Switzerland, d. in Venice; a French painter; first an engraver, then a student with David and Gérard. Extremely critical of his own works, he has limited their number, but they are of great value. The subjects of his most famous pictures are the following: "The Reapers," "Neapolitan Improvisatore," "Madonna del arco," and the "Fishermen of the Adriatic." He committed suicide from the effect of a hopeless love for a woman of rank. *Léopold Robert, sa vie, ses œuvres et ses Correspondances*, is the title of his biography, Paris, 1862.

ROBERT-FLEURY, JOSEPH NICOLAS ROBERT, b. in Cologne 1797; became an eminent French painter; studied with Girodet, Gros, and H. Vernet, and first exhibited in the French salon in 1824. His works followed in rapid succession for many years, and have been widely reproduced in engravings, chromos, and copies. He became full member of the school of fine arts in 1850, and the recipient afterward of many government favors and popular honors. The following are among his noted paintings: "Une Scène de la Saint Barthélémy," 1833, now in the Luxembourg; "Jane Shore, le Colloque de Poissy;" "Une Scène d'Inquisition." His son, Tony, b. Paris, 1837, pupil of Paul

Delaroche, is now one of the leading painters of France, and the recipient of some of the highest medals of the latest French expositions.

ROBERT OF GLOUCESTER, an old English (metrical) chronicler, of whom absolutely nothing is known, except that he was alive about the time of the great battle of Evesham (1265). Robert's work is a "history" of English affairs from the arrival of the fabulous Brutus down to the end of Henry III.'s reign; and is valuable partly for its matter (though that is in the main taken from Geoffrey of Monmouth and William of Malmesbury), but more for the language, which is there seen in its transition from Anglo-Saxon to the English of Chaucer and Wycliffe. It is written in verse, contains more than 10,000 lines, and—if we may judge from the numerous copies that were made of it—was very popular in the middle ages. The principal extant manuscripts are the Bodleian, the Cottonian, and the Harleian. The chronicle was printed by Hearne, in 2 vols., 1724, a reprint of which appeared in 1810.

ROBERTS, BENJAMIN S., 1811-75; b. Vt.; graduated at West Point, served in the Mexican war and the war against rebellion, and attained the rank of maj.gen. of volunteers.

ROBERTS, DAVID, R.A., a painter of great eminence, was b. at Edinburgh on Oct. 24, 1796, and began life there as apprentice to a house-painter. His talent for art becoming obvious, he was set to study at the Trustees' academy; and in 1822 he went to London, where he found employment as a scene-painter at Drury Lane theater. Clarkson Stanfield, since famous as a marine-painter, was then also working at Drury Lane, and between him and Roberts an affectionate intimacy ensued, which ceased only with life. In 1826 a picture of "Rouen Cathedral," exhibited by Roberts at the royal academy, drew attention by its marked ability. The year after appeared his painting of "St. Germain's at Amiens." Shortly after he left England, and for seven years was engaged in sketching in Spain, Africa, and the east. As the result of his labors, there was given to the world in 1839 the splendid work, in 4 vols., entitled *Sketches in the Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia*. The book contains 246 subjects, lithographed by Louis Hague, and illustrated by a historical commentary furnished by Dr. Croly. It is the finest and most elaborate thing of the kind perhaps ever produced, and of itself it would have sufficed for a great reputation to the artist. Pending its appearance, he had resumed his contributions to the academy, of which in 1839 he was elected an associate; the full dignity of academicien being conferred on him two years after. From this time forward he grew steadily in fame, and in 1854 he was selected by the queen to paint for her the "Inauguration of the Great Exhibition in 1851," a task which he achieved with admirable success. In his chosen field of architecture, during all his later life, he was admittedly without a rival. In addition to his unremitting work for the academy he illustrated many books, and issued the admirable series of lithographs, "Spanish Sketches," which attained a great popularity. He died Nov. 25, 1864.

ROBERTS, ELLIS H., LL.D., b. New York, 1827; learned the trade of printing; graduated at Yale college in 1850; became editor and proprietor of the *Utica Morning Herald*; was a member of the state legislature in 1867, and of congress 1871-75. As an editor he has for years had a wide influence.

ROBERTS, ROBERT RICHFORD, D.D., 1778-1843; b. Md.; ordained in the Methodist Episcopal church in 1804; pastor of churches in Baltimore; Alexandria, Georgetown, and Philadelphia; in 1815 appointed presiding elder of the Schuylkill district, and, on the death of bishop Asbury, elected president of the Philadelphia conference in 1816; in May of the same year was elected bishop. He resided at first in Pennsylvania, afterward in Indiana. In 1819 he traveled over 5,000 miles. He had good oratorical gifts, and much modesty and gentleness.

ROBERTSON, a co. in n.e. Kentucky, bounded on the s. and w. by the Licking river; drained by it and the n. fork of the Licking; about 175 sq.m.; pop. '80, 5,814—5,782 of American birth. The surface is rolling or hilly. The soil is fertile. The principal productions are corn, wheat, and tobacco. Co. seat, Mount Olivet.

ROBERTSON, a co. in n. central Tennessee, adjoining Kentucky; drained by Red river and Sulphur fork; traversed by the St. Louis and South-eastern railroad; 500 sq.m.; pop. '80, 18,862—18,803 of American birth, 5,618 colored. The surface is hilly, and there are extensive forests; tobacco, wheat, corn, and pork are the staples. The chief export is whisky, which is made in large quantities and of remarkable excellence. Co. seat, Springfield.

ROBERTSON, a co. in central Texas, bounded on the e. by the Navasoto river, and on the w. by the Brazos, drained by their tributaries; crossed by the Houston and Texas Central, and the International and Great Northern railroads; 840 sq.m.; pop. '80, 22,335. The surface is undulating, partly prairie, and partly covered with forests of valuable timber; the soil is fertile, and rich bottom lands border the streams. The principal products are corn, cotton, and wool; sheep and swine are raised in large numbers. Co. seat, Calvert.

ROBERTSON, CHARLES FRANKLIN, S.T.D., b. New York, 1835; graduated at Yale college in 1859; at the general theological seminary (Protestant Episcopal) New York, in 1862; was rector of several churches, and consecrated bishop of Missouri in 1868.

ROBERTSON, FREDERICK WILLIAM, M.A., an English preacher, was the son of a Scotch gentleman, capt. Frederick Robertson of the royal artillery, and was b. in London Feb. 3, 1816, in the house of his grandfather, col. Robertson. At the age of 9 he was sent to the grammar-school of Beverley, in Yorkshire, where he remained for a few years, and then accompanied his parents to the continent, where he became a proficient in French. In 1832 he entered the rector's class at the Edinburgh academy, and there competed, we are told, "all but successfully," for the highest classical honors of the institution with James Moncreiff (now lord justice-clerk for Scotland). Next year Robertson proceeded to the Edinburgh university, and while there had for private tutor the rev. Charles Terrot, subsequently bishop of the Scottish Episcopal church in the same city. He was originally designed for the bar, but the study of law did not prove interesting to him, and he would gladly have become a soldier, for he always felt (as he afterward confessed) "an unutterable admiration of heroic daring;" but certain difficulties intervened in the way of obtaining a commission, and Robertson, in obedience to the wish of his father, entered Brasenose college, Oxford, to study for the church, in 1836. His life had all along been marked by its singular purity and depth of religious feeling; hence his new career inspired him with no regret, but rather with a high resolve to be worthy of his calling. His first appointment was to the curacy of St. Maurice and St. Mary Calendar, but his health broke down in the course of a year, and he was compelled to visit the continent. On his return to England he was for a time curate to the incumbent of Christ church, Cheltenham, whence, in the beginning of 1847, he removed to St. Ebbes, Oxford, and was just beginning to attract the notice of the undergraduates at Oxford when he was offered the incumbency of Trinity chapel, Brighton. His "career" in Brighton—though it is perhaps wrong to describe a life so pure, delicate, unselfish, devoted as his by a term expressive of vulgar ambition—was brief but glorious. For six years he continued to preach sermons, the like of which, for blending of delicacy and strength of thought, poetic beauty, and homely lucidity of speech, had perhaps never been heard before in England. Robertson was unhappily (for his comfort) not very "orthodox;" consequently he was long misunderstood, and vilified by the "professedly religious portion of society;" but so true, so beautiful, was his daily life and conversation, that he almost outlived those pious calumnies, and his death (from consumption, Aug. 15, 1853) threw the whole town into mourning. His sermons (of which four series have been published) have attained great popularity and a very large circulation. The first series was published in 1855 (11th edition, 1863). Robertson's *Expository Lectures on St. Paul's Epistle to the Corinthians* appeared in 1859. His *Lectures and Addresses on Literary and Social Topics* contain passages of faultless beauty and refinement; but as they were delivered to mixed audiences, and never intended for publication, they do not perhaps exhibit that rigorous intellectual grasp of a subject, or that strong and searching criticism of which their author was so capable. A good biography, with letters, was published in 1865 by the rev. Stopford A. Brooke (5th ed. 1868).

ROBERTSON, JAMES, 1725-88; b. Scotland, took part in the campaign against Louisburg and Ticonderoga. He was made maj.gen. in 1776, and led a brigade at the battle of Long Island. He was appointed royal governor of New York in 1779, and lieut.gen. in 1782.

ROBERTSON, JAMES, 1742-1814, b. Va.; emigrated to Tennessee in 1769, and was one of the founders of the Cumberland settlements. He was appointed brig.gen. and commander of the Tennessee militia in 1790, and for the last part of his life was agent of the United States to the Chickasaw Indians.

ROBERTSON, JAMES CRAGIE, D.D., b. Scotland, 1813; graduated at Trinity college, Cambridge, in 1834; ordained in the English church; became vicar of Beaksbourne in 1845; canon of Canterbury in 1859; professor of church history in King's college, London, in 1864. His chief work is *History of the Christian Church from the Apostolic Age to the Reformation*, 8 vols. He has published also, *How shall we conform to the Liturgy of the Church of England; The Bearings of the Gorham Case; Becket, Archbishop of Canterbury, a Biography; Church History during the First Six Centuries.*

ROBERTSON, JOSEPH, the most accomplished Scottish antiquary of the present century, was b. at Aberdeen on May 17, 1810. He was educated at Uduy, in his native county, at the grammar-school of Aberdeen, and afterward at the Marischal college there. The law was chosen for him as his profession, but his heart was not in the task, and from an early age he devoted himself to literature. His chief attention then, as in his after life, was directed to researches connected with the history and antiquities of Scotland; and in 1833 he went to Edinburgh, the place of all others best adapted for the cultivation of his favorite studies. While there he wrote for Oliver and Boyd's Cabinet Cyclopaedia a volume on the *Circumnavigation of the Globe*, which was published in 1836. The work by which he became first generally known, *The Book of Bon-accord, or a Guide to the City of Aberdeen*, was published in 1839. It is

justly styled by Mr. Charles Knight, in his *Life of Shakespeare*, "a most lively, instructive, and learned volume—a model of guide-books." A continuation of this work was promised, but was never completed. In the following year his *Delicæ Literariæ, a new volume of Table-talk*, was published. In 1839 he returned to the north to undertake the editorship of the *Aberdeen Constitutional* newspaper; and in the end of that year, in conjunction with Mr. John Stuart, he founded the Spalding club, a society instituted for printing the historical, ecclesiastical, genealogical, topographical, and literary remains of the n.e. counties of Scotland. This society, formed on the model of the Bannatyne and Maitland clubs, has printed many valuable works on Scottish archaeology, which otherwise would have been all but inaccessible. Its earliest publication was a *History of Scots Affairs from 1637 to 1641*, written by James Gordon, parson of Rothiemay, which was issued in three vols. in 1841, under the joint editorship of Mr. Robertson and Mr. Grub. Robertson edited for the same club a volume of *Collections for a History of the Shires of Aberdeen and Banff* (1843); three vols. of *Illustrations of the Topography and Antiquities of the Shires of Aberdeen and Banff* (1847, 1857, and 1862); and *Passages from the Diary of General Patriek Gordon of Auchleuchries* (1856). He also contributed to the fifth volume of the miscellany of the club, in 1852, a learned paper *On Scholastic Offices in the Scottish Church in the 12th and 13th Centuries*. In 1843 Robertson went to Glasgow to become editor of the *Glasgow Constitutional* newspaper. While in that city he edited for the Maitland club, in 1846, a volume containing the *Book of the Collegiate Church of St. Mary and St. Anne, Glasgow*, and the *Chartulary of the Black Friars of Glasgow*; and in 1847, the fourth volume of the miscellany of the club. In June, 1849, he contributed to the *Quarterly Review* an article on Scottish abbays and cathedrals, which has become a text-book for all who write on that subject. In the same year he once more took up his residence in the Scottish metropolis, on being appointed editor of the *Edinburgh Evening Courant*. He discharged his editorial duties at Aberdeen, Glasgow, and Edinburgh with faithfulness and ability; but he found a more congenial occupation when, in 1853, he was appointed, through the earl of Aberdeen, who knew and appreciated his merits, to the office which is now known as that of curator of the historical department of the register-house at Edinburgh. In 1863 he edited for the Bannatyne club the *Catalogues of the Jewels, Dresses, Furniture, Books, and Paintings of Mary Queen of Scots*. This volume contains a preface which forms a most valuable contribution to the history of Mary's reign, and supplies information on almost all the controversies connected with her life. With the sanction and zealous encouragement of sir William Gibbon-Craig, lord clerk-register of Scotland, he projected the publication of a series of works connected with the history of Scotland, similar to those which have appeared in England under the direction of the master of the rolls. The first volume of the series, the chronicles of the Picts and Scots, has been edited by Mr. Skene, and several others have since been published. Robertson assisted in other literary undertakings, and was a valuable contributor to this *Encyclopædiæ*. His articles are generally connected with his favorite studies; among them are those on ARCHEOLOGY, BURGII, ST. COLUMBA, CRANNOGES, the CULDEES, DAVID I., the FAMILY OF DOUGLAS, IONA, MARY STEWART, and OSSIAN. The last and most important of Robertson's works was his *Concilia Scotiæ*, printed in two vols., in 1866, for the Bannatyne club. This work has done for the Scottish church that which archdeacon Wilkins did for the church of England in his *Concilia Magnæ Britannia et Hiberniæ*. It contains the statutes of all the Scottish councils, whether provincial or diocesan, from the earliest period to the reformation, printed carefully from the best authorities; and the preface, which occupies the greater part of the first volume, is a learned and authentic history of the councils, and of everything bearing on the subject of them. The authorities are quoted with an accuracy and copiousness for which Robertson was remarkable, and which contrasts strongly with the carelessness in that respect which marks some popular historians of the present day. In April, 1864, Robertson received the degree of LL.D. from the university of Edinburgh. He died on Dec. 13, 1866, almost immediately after the publication of his *Concilia Scotiæ*. Robertson's labors were not to be estimated merely by the works which appeared under his name, or which he is known to have written. There was hardly a work of any merit published during the last twenty years of his life, in connection with Scottish history and antiquities, to which he did not in some way or other give his assistance; and his assistance was given with a thorough heartiness which only those who have benefited by it can appreciate. No literary man of his time was more beloved by his friends and intimate associates. In the relations of private life, he was most exemplary.

ROBERTSON, THOMAS WILLIAM, 1829-71; b. England, actor and author, played in the company of which his father was manager, was a writer in London for many years, contributing to the popular magazines and producing very successful plays. *A Night's Adventure* had an auspicious opening at the Olympic theater 1851; and *Society*, opportunely brought out at the opening of the Prince of Wales' theater 1865, made the author suddenly famous. *David Garrick* has had a great run with Sothern in the title role; and his plays of *Ours, Caste, and School*, have been equally popular. He published a novel of David Garrick founded on the comedy. In 1869, associated with J. C. Hotten, he edited Artemas Ward's *Lectures at the Egyptian Hall* (illustrated) and other *Relics of the Humorist*.

ROBERTSON, WILLIAM, the historian, was born in the year 1721, in the county of Edinburgh, and in the parish of Borthwick, of which his father was minister. He went to school at Dalkeith, a few miles distant from his home; but in 1733 his father's appointment to a charge in Edinburgh gave him the opportunity of attending school and college there. He was licensed as a preacher in 1741, and in 1743 was ordained to the parish of Gladsmuir, where the battle of Prestoupan was to be fought two years afterward. In "the '45," he showed his zeal for the government cause by joining a body of volunteers formed in Edinburgh; and when the majority of his comrades saw that it was useless for them to attempt to defend the town, he, with a few whom he had infected with his ardor, went to offer their services to sir John Cope. The latter, conscious that he had already too many elements of imperfect discipline in his army, had the prudence to decline this offer. Robertson afterward became a leader in what was called "the moderate" side in the ecclesiastical courts; and in 1758 was promoted to one of the Edinburgh charges, where he had increased opportunities of influence. In 1759 he published his celebrated *History of Scotland*. He avowedly passed over the earlier periods, speaking of them as "dark and fabulous," which no doubt they were in the hands of those who had treated them; but it may be regretted that Robertson did not bring his acuteness to bear on the materials for their elucidation. In 1762 he was made principal of the university of Edinburgh. In 1769 he published the *History of the Reign of the Emperor Charles V.*, to which he prefixed a *View of the State of Society in Europe from the subversion of the Roman Empire to the beginning of the Sixteenth Century*. This is the most valuable of his works. The field has been often since gone over by authors who have discovered much new material, but all the use they have made of it has become a sort of tribute to the natural sagacity of Robertson. His *History of America* was published in 1777. These works are admirable for their elegant and vigorous style. Robertson died in 1793. He was a genial man, with a large circle of friends. He had great conversational powers, and was reputed to be fond of displaying them. Interesting notices of his early life will be found in the autobiography of his friend Dr. Carlyle, and a sketch of the closing years is given in lord Cockburn's *Memoirs of his Life and Times*.

ROBERTSON, WILLIAM II., b. Bedford, N. Y., 1823; received an academic education, and studied and practiced law. In 1849-50 he was a member of the New York state assembly; and a member of the state senate in 1854-55. He was judge of Westchester county, N. Y., for twelve years; a presidential elector in 1860 and in 1880; and was elected a representative in the 40th congress as a republican, serving 1867-69. In 1881 he was appointed by president Garfield for the position of collector of the port of New York, being at the time a member of the state senate, to which he had been elected in 1875.

ROBESON, a co. in s. North Carolina, adjoining South Carolina, drained by Lumber river, Little Pedee river, and Rockfish creek; traversed by the Carolina Central railroad; about 990 sq. m.; pop. '70, 16,262—16,221 of American birth, 737 colored. The surface is mostly level woodland. The soil is sandy. The principal productions are corn, cotton, potatoes, turpentine, and tar. Co. seat, Lumberton.

ROBESON, GEORGE M., b. N. J., 1827; graduated in 1847 at Princeton college; studied and practiced law. In 1859 he was prosecuting attorney for Camden co., N. J. At the beginning of the war of the rebellion he was appointed brig. gen., of volunteers, was efficient in the organization of the state troops, and served during the war. In 1867 he was attorney-general of New Jersey, and held the position two years. He was appointed secretary of the navy by president Grant, and continued in that office from June, 1869, to the close of the administration. He was elected a republican member of the 46th congress, from Camden, N. J., and served through the term.

ROBESPIERRE, MAXIMILIEN MARIE ISIDORE DE, was born May 6, 1758, at Arras, where his father was an unsuccessful advocate. Having distinguished himself at the college of his native place, he was sent through the influence of a canon of the cathedral of Arras, to complete his education in Paris, at the college of Louis le Grand, where, by a singular chance, he found himself a fellow-student with Fréron, and Camille Desmoulins. In his studies, he was noted for diligence, regularity, and intelligence; and on the completion of his course at college, he devoted himself to the study of jurisprudence. After some years thus passed, he returned to Arras, to follow the profession of his father. In this his success was decided; and previous to the commencement of his more public career, he had become a person of considerable local note. While sedulously attending to his professional duties, he cultivated literature, not wholly without distinction; and in 1783 became a member of the Academy of Arras. Of the verses, which at this time he seems to have been fond of writing, some curious fragments are preserved. Having, it is said, in discharge of his duty as member of the criminal court, been obliged to condemn a culprit to death, he resigned his situation on a point of conscientious objection to the barbarity of capital punishment—an incident sufficiently piquant in its contrast with subsequent portions of his history. On the memorable convocation of the states-general in 1789, he had local influence sufficient to secure his election as one of the deputies of the *tiers-état*, in which capacity he immediately repaired to Versailles. In the assembly, he was for some time of little account; but gradually he made for him-

self a position, and nice observers noted in him a quality of fanatical earnestness and conviction, in virtue of which they surmised for him a great career. "This man," said Mirabeau in particular, "will go far, for he believes every word he says." (*Cet homme ira loin, car il croit tout ce qu'il dit*). Though in the constituent assembly he spoke frequently, and—despite the disadvantages of a mean person, a harsh shrill voice, and an ungainly manner—always with increasing acceptance, it was outside as a popular demagogue and leader in the famous Jacobin club that his chief activity was exerted; and in this field his influence speedily became immense. After the death of Mirabeau, whose giant figure, whilst he lived, seemed to dwarf all meaner men, his importance became more and more recognized; and from this time forward till his death his biography is in effect the history of the revolution. In May, 1791, he proposed and carried the decree by which members of the assembly were excluded from a place in the legislature which succeeded; a measure obviously disastrous, as deteriorating the quality of the assembly, and more and more insuring its subjection to the Jacobins, of whom Robespierre was now the idol. His early aversion to capital punishment has been spoken of; and it is curious enough to be noted, *en passant*, that now, on the 30th of May, he delivered an oration against it in the assembly, denouncing it as "base assassination." On the dissolution of the constituent assembly in Oct., 1791, Robespierre, now famous, revisited his native town, where he was received with enthusiasm; an escort of the national guard did honor to his entrance, and a general illumination of the place testified the admiration of the citizens for their deputy. After a stay of seven weeks, he returned to Paris, and resumed his activity as a leader of the Jacobin club. In the *émeute* of August 10, following, by which the king was dethroned, he took no prominent part; and though his complicity is suspected in the September massacres which ensued, no very distinct share in the infamy has ever yet been proved against him. To the national convention, which was now formed, he was returned at the head of the Paris deputies; and as recognized chief of the extreme party called the Mountain, he was one of the main agents in procuring the execution of the king, which took place in Dec., 1792. In the following year occurred his final struggle with the Girondists, who had twice before attacked him with a view to compass his destruction, and the chief men among whom he now triumphantly sent to the scaffold. The period of "the terror" followed: Marie Antoinette and the infamous duke of Orleans were the first victims; Pétion, Danton, and Camille Desmoulins were next immolated, on a suspicion of favoring a reactionary policy; and for months, under the so-called committee of public safety, Paris became the scene of an indiscriminate quasi-judicial slaughter, in which some thousands of lives were sacrificed. With these enormous atrocities, the name of Robespierre, along with those of his friends, Couthon and St. Just, remains peculiarly associated. In the midst of the horror, took place, on June 8, 1794, that strange *Fête de l'Être Suprême*, in which, in the name of the republic, the existence of a deity was decreed—a day of triumph for Robespierre, who, conspicuous as the first man in France, presided at the solemn mummerly. But the end was near; men were weary of "the terror," and the general sense of insecurity it induced; Robespierre had many enemies; in particular, the numerous friends of Danton were eager to avenge his death; a conspiracy was organized against "the tyrant," as he was now called, and after a scene of fierce tumult in the convention, his arrest was accomplished. A rescue by the populace followed, but he lacked the courage and promptitude to turn the opportunity to account; while he hesitated, his enemies acted, and in July, 1794, he closed his career on the scaffold to which he had sent so many others.

Though without great and heroic qualities, Robespierre can scarcely have been the mean and contemptible creature he has not unfrequently been represented. The instant effect of his oratory we know; and even as read, his speeches command respect for the mental power they exhibit. The subtlest practical tact and judgment he must plainly have possessed; and though timid in his own person, he was dexterous to appropriate the results obtained by the boldness of others. In principle he was severe and consistent; and the title of "incorruptible," which he early acquired, seems throughout to have been thoroughly deserved. In private life he was amiable; and though he waded to his public ends through blood, he had not the savage joy in the shedding of it which it has been common to attribute to him. He was callous, not actively cruel; and during the time of "the terror," it is simply the truth, that he was rather reluctantly acquiescent, than active in the atrocities for which he has since been held above all others responsible. "Death—always death!" he is said to have frequently exclaimed in private, "and the scoundrels throw it all on me! What a memory shall I leave behind me, if this lasts! Life is a burden to me." For a candid view of the character on this and its other sides, the more curious reader may be referred to the work on the subject by Mr. G. H. Lewes—*Life of Maximilien Robespierre, with Extracts from his Unpublished Correspondence* (London, Chapman and Hall, 1849). See also the Histories of Thiers, Mignet, Carlyle, Michelet, Louis Blanc, and Ernest Hamel's *Vie de Robespierre* (Par. 1865).

ROBIN, besides being a familiar name of the redbreast (q. v.) in Britain, and frequently given to the bluebird (q. v.) in America, is also in America the usual name of a species of thrush (q. v.) widely distributed from Mexico to lat. 60° north. It is nearly twice the

size of the redbreast, olive gray, the top and sides of the head black, the chin and throat white with black streaks, the under parts chestnut brown. It remains during winter in sheltered places, even as far n. as New England, but is generally a bird of passage. Many arrive in New England before the snow has disappeared. Large flocks are to be seen in the southern states in winter, where great numbers are killed for the table, the markets being often glutted with them. In Massachusetts, the law forbids the killing of this bird at any season of the year. Its nest is often built near houses. Two broods are produced in the year. The robin is a lively bird, and a general favorite in the northern parts of the United States. It is often kept as a cage-bird, is very gentle and easily tamed, and has a pleasing song.

ROBIN, CHARLES PHILIPPE, b. 1821; a French physician and student of natural science; a prolific author of biological, entomological, medical, and anatomical works, and member of the left in the republican party of the legislative chamber in 1876-77. Among his works are: *Des Fermentations; Mémoires sur l'Existence d'un Œuf ou Ovule, chez les Mâles comme chez les Femelles des Végétaux comme des Animaux*, read before the institute in 1848, and reproduced in other languages. This has been followed by a great number of publications on medical subjects. His latest work, 1877, is entitled *L'Instruction et l'Éducation*.

ROBIN GOODFELLOW, a name given in England to a domestic spirit or fairy, analogous in character to the *Nisse God-dreng* of Scandinavia, the *Knecht Ruprecht*, i. e., Robin of Germany, and the *Bronnie* of Scotland. Roguery and sportiveness were the characteristics of this spirit; and in the reign of Elizabeth, his existence was so generally credited, that he was "famous in every old wives' chronicle for his mad merry pranks." It was from the popular belief in this spirit that Shakespeare's "Puck" was derived. From the early ballads concerning Robin, we learn that he was the offspring of a "proper young wench by a hee-fairy," who was no less a person than Oberon, king of Fairyland. In his youth, Robin displayed such mischievous tricks that his mother found it necessary to promise him a whipping. He ran away from home, and engaged with a tailor, from whom he also eloped. When tired, he sat down, and fell asleep, and in his sleep he had a vision of fairies. On awaking, he found lying beside him a scroll, evidently left by his father, which, in verses written in letters of gold, informed him that he should have anything he wished for, and also the power of turning himself into various shapes; but he was to harm none but knaves and queans, and was to "love those that honest be, and help them in necessity."

As a specimen of his "mad pranks," Robin went one day to a wedding as a fiddler, and was a welcome guest; but in the evening "then hee beganne to play his merry trickes in this manner. First, hee put out the candles, and then being darke, hee strucke the men good boxes on the eares; they, thinking it had bene those that did sit next them, fell a-fighting one with the other, so that there was not one of them but had either a broken head or a bloody nose. At this, Robin laughed heartily. The women did not scape him, for the handsomest hee kissed: the others hee pinched, and made them scratch one the other, as if they had bene cats. Candles being lighted againe, they all were friends, and fell againe to dancing, and after to supper. Supper being ended, a great posset was brought forth. At this, Robin's teeth did water, for it looked so lovely that hee could not keepe from it. To attaine to his wish, hee did turne himself into a beare: both men and women seeing a beare amongst them, ranne away, and left the whole posset to Robin. Hee quickly made an end of it, and went away without his money, for the sport hee had was better to him than any money whatsoever."

Although Robin was a sprite particularly fond of disconcerting and disturbing domestic peace, he was believed to be easily propitiated. If a bowl of milk, or curds and cream, were duly laid out for him, he would at midnight perform for the servants many household duties. If this were neglected, Robin would revenge himself by pinching and otherwise annoying the inmates. The following passage in Shakespeare's *Midsummer Night's Dream* fully describes Robin's peculiarities:

Either I mistake your shape and making quite,
Or else you are that shrewd and knavish sprite
Call'd Robin Goodfellow: are you not he
That frights the maidens of the villagery;
Skims milk, and sometimes labors in the quern,
And bootless makes the breathless housewife churn;
And sometime makes the drink to bear no barm:
Misleads night-wanderers, laughing at their harm?
Those that hobgoblin call you, and sweet Puck,
You do their work, and they shall have good-luck.

The *Mad Pranks and Merry Jests of Robin Goodfellow* have been reprinted from the edition of 1628 by the Percy society in 1841.

ROBIN HOOD. See HOOD, ROBIN, *ante*.

ROBINIA, a genus of trees and shrubs of the natural order *leguminosæ*, suborder *papilionacea*, having a 4-fid calyx, with the upper segment divided into two; stamens, nine united, and one free: the pod long and many-seeded. The species are widely diffused over the world. The most important is a North American tree, sometimes called the *locust tree* (q. v.), also known as the *false acacia*, or *thorn acacia*, often simply desig-

nated *acacia*. It was raised from seed in France by John Robin, about the year 1600, and gradually spread over the warmer parts of Europe and the s. of Siberia. On account of its thick growth, its spines, and its property of submitting to be clipped into any form, it is very suitable for hedges. In the s. of Europe, it succeeds well as a timber tree, but in more northern regions, it suffers from frost in severe winters; and in Britain it often suffers from frost, owing to the imperfect ripening of the wood in summer. The wood is compact, hard, and takes a fine polish; for many purposes, it is scarcely inferior to oak, which it rivals in toughness and strength. It does not readily rot in water, and is used for ship-building. The tree is very ornamental, and of rapid growth. It is found wild in abundance from the Alleghanies to the Rocky mountains. Its leaves are pinnate, with 9 to 13 thin and smooth leaflets. The flowers are fragrant and white, in large pendulous racemes. The roots throw up many suckers; and are very sweet, affording an extract resembling licorice. An agreeable syrup is also made from the flowers.—*R. viscosa* is a smaller tree, but even more ornamental, a native of the south-western parts of the Alleghany mountains. It has rose-colored scentless flowers. The young branches are viscid.—The ROSE ACACIA (*R. hispida*) is a native of the south-western ranges of the Alleghanies, and is a highly ornamental shrub, with hispid branches, and large rose-colored scentless flowers.—*R. Caragana* is a native of the s.e. of Europe, and is planted for hedges at St. Petersburg, where it spreads like an indigenous plant.

ROBINS, BENJAMIN, a celebrated English mathematician and artilleryman, was b. at Bath in 1707, of parents who belonged to the society of Friends, and who were in such poor circumstances as to be unable to give their son a good education. Robins, however, having obtained a little instruction in mathematics, prosecuted this branch of science with great zest, and having acquired a good elementary knowledge of it, he removed, by the advice of Dr. Pemberton, to London, where he set up for a teacher of mathematics. During his leisure hours, he improved himself in his favorite subject by reading the works of the ancient and modern geometers, and by the study of the Latin, Greek, and several modern languages. He also published several mathematical treatises, which gained for him considerable reputation. Robins next commenced the series of experiments on the resisting force of the air to projectiles, which has gained him so much celebrity, varying his labors by the study of fortification; a science with which he obtained a practical acquaintance by visiting many of the most celebrated works of this class in Flanders. In 1734 he demolished, in a treatise entitled *A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions*, the objections brought by the celebrated Berkeley, bishop of Cloyne, against Newton's principle of ultimate ratios. His great and valuable work, the *New Principles of Gunnery*, upon the preparation of which he had spent an enormous amount of labor, appeared in 1742, and produced a complete revolution in the art of gunnery. Previous to Robins's time, it had never been attempted to estimate the velocity of balls otherwise than by the ordinary parabolic theory of Galileo (see PROJECTILES). Robins suggested two methods for obtaining this information—viz. (1) by finding experimentally the initial force of fired gunpowder confined to a certain space, and the law of the decrease of this force as the space increased, thence calculating the velocity which would be imparted to a body of given weight; and (2) by the *ballistic pendulum*. The second method has been found in practice to be more preferable for accuracy. Robins, in the course of his experiments, also discovered and explained the curvilinear deflection of a ball from a vertical plane. Some of his opinions having been questioned in the *Philosophical Transactions*, Robins ably replied to these objectors, and also wrote several dissertations on the experiments made by order of the royal society in 1746-47, for which he received their annual gold medal. In consideration of his able defense of the policy of the then government, by means of pamphlets which he wrote and published from time to time, he received (1749) the post of "engineer-in-general to the East India company;" but his first undertaking, the planning of the defenses of Madras, was no sooner accomplished than he was seized with a fever, and though he recovered from it, his vital energy had been exhausted, and he died July 29, 1751. Robins was considered as one of the most accurate mathematicians of his time. His mathematical works were collected after his death, and along with the details of his latest experiments in gunnery, were published by Dr. Wilson in 1761. It may also be mentioned that Robins had some share (to what extent is now unknown) in the composition of Anson's *Voyage Round the World* (1740-44).

ROBINSON, BEVERLEY, 1723-92; b. Va.; son of John Robinson, president of the council of Virginia, 1734. He was present at the siege of Quebec, under Wolfe, in 1759, with the rank of maj. He married the daughter of Frederick Phillipse, a rich landowner on the Hudson river. In the revolutionary war he was col. of the loyal American regiment, a tory organization, which he raised. His country house was the scene of the preliminary arrangements for the treasonous plot in which Arnold was the central figure, and in which he himself was intimately concerned. After the war he retired with a part of his family to England, a heavy loser by his political ventures.

ROBINSON, REV. EDWARD, D.D., LL.D., philologist and biblical scholar, was b. at Southington, Conn., April 10, 1794, graduated at Hamilton college, Clinton, in the state of New York, in 1816, where he was engaged as tutor and in pursuing his studies until

1821, when he went to Andover, Mass., to superintend the printing of an edition of the first six books of the *Iliad*, previous to which he had married, and become a widower. He studied Hebrew with prof. Stuart at Andover, to whom he became an assistant professor. In 1826 he began four years' travel and study in Europe, where he married Miss Therese A. L. von Jakob, daughter of a professor at Halle. Returning in 1830 to Andover, he was appointed extraordinary professor of sacred literature, and librarian, but resigned in 1835, removed to Boston, and in 1837 was appointed professor of biblical literature in the Union theological seminary, city of New York. At this period he made, in company with rev. Eli Smith, an extensive survey of Palestine, of which he gave an account in his admirable work, entitled *Biblical Researches in Palestine and Adjacent Countries* (3 vols. 8vo, Halle, London, and Boston, 1841)—which will always remain a standard work on the subject. He entered upon the active duties of his professorship in 1840; and in 1852 made a second visit to Palestine, of which he published an account in 1856. His other works are a translation of Buttmann's *Greek Grammar*, 1833 and 1850; *Greek and English Lexicon of the New Testament*, 1836 and 1850; *Harmony of the Four Gospels*, in Greek, 1845, and in English, 1846. He was also editor of the *Biblical Repository*, *Bibliotheca Sacra*, Calmet's *Bible Dictionary*, a translation of Gesenius's *Hebrew Lexicon*, etc., and was an active member of geographical, oriental, and ethnological societies. He died in 1864.

ROBINSON, EZEKIEL GILMAN, D.D., LL.D., b. Mass., 1815; graduated at Brown university in 1838, and Newton theological seminary in 1842; was ordained and settled as pastor of a Baptist church, Norfolk, Va., 1842; became professor of Hebrew in 1846 in the theological seminary at Covington, Ky.; professor in 1853 in Rochester theological seminary, and subsequently its president. In 1872 he was elected president of Brown university, which position he still fills. He was the translator of Neander's *History of the Planting of the Church*; published an address on the *Relation of the Church and the Bible*; and edited the *Christian Review* 1859-64. He is an effective and popular preacher.

ROBINSON, HENRY CRABE, 1775-1867; b. England; studied law in London and elsewhere, and spent five years in German universities, studying German philosophy and literature, and was admitted to intimacy with the creators of modern German poetry, Schiller, Goethe, Wieland, and others. In 1808 he went to Spain and wrote to the London *Times* letters descriptive of the peninsular campaign. He afterward became a regular editorial writer and literary critic of that paper. In 1813 he began the practice of law and within fifteen years had acquired a fortune large enough to allow him to indulge his taste for literature and the society of literary men. Among his intimate friends were Wordsworth, Lamb, Coleridge, Southey, Flaxman, Clarkson, Charles G. Loring, a leader of the Boston bar, and many others. After his death selections from his *Diary* and *Correspondence* were published under that name. He took part in founding the Flaxman gallery and University college, both in London.

ROBINSON, JAMES S., b. Ohio, 1828; entered the 4th Ohio volunteers in 1861, served through the Rich mountain campaign, and was promoted maj. He became col. the next year, was with Fremont in the Shenandoah valley, took part in the second battle of Bull Run, was dangerously wounded at Gettysburg, and commanded a brigade in Sherman's southern campaign. He fought at Resaca, Dallas, Averyborough, and in other engagements, and left the army at the close of war with the rank of brevet maj.-gen.

ROBINSON, JOHN, 1575-1625; b. England; educated at Cambridge; held a benefice near Yarmouth in Norfolk, but was suspended by the bishop for nonconformity; formed a church of Independents at Norwich in 1602. Persecuted by the government, its members in 1607 attempted to leave for Holland, but were prevented by the civil officers. In 1608 they renewed the attempt with success and reached Amsterdam, which in a year they left for Leyden. Here they remained 11 years, and the church was enlarged to 300 by the arrival of English exiles. In 1613 Robinson had a controversy on free-will with Episcopius, the successor of Arminius, professor in the university of Leyden. Persecuted still by archbishop Laud, the pastor favored a removal to America. In the beginning of 1620 they kept a day of fasting and prayer, and in accordance with the decision, elder Brewster with a part of the congregation set out Jan. 21 in two ships, the *Speedwell* and *Mayflower*. The vessels sailed Aug. 5, 1620, from Southampton with 120 passengers. The *Speedwell* being leaky put in at Dartmouth for repairs. Again, Aug. 21, they sailed, when both ships, proving unseaworthy, they put back to Plymouth, 20 left the *Speedwell*, and the rest, 101, went on the *Mayflower*. Robinson intended to follow, but died before the arrangements were complete. Nov. 9, cape Cod was sighted, and the next day the *Mayflower* entered the harbor. They called it Plymouth. Before disembarking they formed a democratic government, and elected John Carver governor for a year. The remainder of Robinson's church with his widow and sons John and Isaac emigrated not long after his death. Robinson was a man of profound faith, a thorough classical scholar and a keen controversialist. He published *A Justification of Separation from the Church of England; Of Religious Communion; A Defense of the Doctrine Propounded by the Synod of Dort; A Treatise of the Lawfulness of Learning of the Ministers in the Church of England; Essays or Observations Divine and Moral*. His complete works have been published in 3 vols. by the Congregational board of publication.

ROBINSON, JOHN CLEVELAND, 1817-80; b. Binghamton, N. Y.; left the military school after three years study, and in 1838 began the study of law; returned to the army; was in the Mexican war; distinguished himself at Monterey, and rose to be col. He served in the Indian wars of Florida and Utah; and during the war of the rebellion was commandant at fort McHenry, Baltimore; commanded 1st brigade of gen. Kearney's division of the corps under gen. Heintzelman, and was distinguished for gallantry in the seven days' battle before Richmond, 1862, at Chantilly, and at Fredericksburg. He commanded a division through the peninsular campaign, and lost a leg at Todd's Tavern. His record shows 3 brevets in the regular army for as many battles, to which that of maj.gen. was added, for a constant display of skill and courage. He retired from the service in 1869.

ROBINSON, LUCIUS, b. N. Y., 1810; commenced the practice of law 1832; master in chancery, 1843 and 1845; joined the republican party, was elected to the legislature 1859; comptroller of the state 1861, and again 1863; became the democratic candidate for the same office 1865, and was defeated; but was elected comptroller by the same party in 1875, and governor in 1876; was a candidate for re-election in 1879 and defeated.

ROBINSON, SOLOX, 1803-80; b. Tolland, Conn.; began his literary career by contributing to the *Albany Cultivator*, and was an industrious writer for agricultural journals. He was for some years agricultural editor of the *New York Tribune*; and was the author of *Hot Corn: Life Scenes in New York* (illustrated), which had a sale the first year of 50,000 copies. In 1860 he published *How to Live*; 1864, *Facts for Farmers*. In 1870 he removed to Jacksonville, Fla., and engaged in farming, contributing letters on southern agriculture to the *Daily Tribune* in 1879.

ROBINSON, STUART, D.D.; b. Ireland, 1816; graduated at Amherst college in 1836; studied theology at the Union theological seminary at Prince Edward, Va.; was Presbyterian pastor in Baltimore 1852-56; professor of ecclesiology at Danville, Ky., 1856-58; in 1858 became pastor of the Second Presbyterian church, Louisville, Ky., which pastorate he resigned in 1881. He was strongly on the southern side in the rebellion. He has published *The Church of God; Discourses of Redemption; Discourses on the Pentateuch*. He edited in Baltimore, 1855-56, *The Presbyterian Critic*, and *The True Presbyterian*, in Louisville, Ky., which was suppressed by the government. In 1873 he visited Egypt and the Holy Land. He has ranked as the leading preacher in Louisville.

ROBINSON, MRS. THERESE ALBERTINE LOUISE, wife of the preceding, and daughter of prof. von Jakob, known to the world of letters as "Talvi," a name composed of her initials, was born at Halle, Germany, Jan. 26, 1797. In 1807 she accompanied her father to Russia, where he had an appointment as professor in the university of Kharkov. In 1810 they removed to St. Petersburg, where she learned modern languages and history. In 1816 they returned to Halle, and there she studied Latin, and wrote a volume of tales, published in 1825 under the title of *Psyche*; and under the signature of "Ernest Berthold," translations of sir Walter Scott's *Black Dwarf* and *Old Mortality*, and also two volumes of Servian popular songs—*Volkslieder der Serben*. In 1828 she was married to prof. Robinson, and in 1830 accompanied him to America, where she studied the languages of the aborigines, translated Pickering's *Indian Tongues* into German, and contributed a *Historical View of the Languages and Literature of the Slavic Nations to the Biblical Repository*. In 1837 she accompanied her husband back to Germany, and published *An Essay on the Historical Characteristics of the Popular Songs of the German Nations, The Poems of Ossian not Genuine, a History of Captain John Smith*, in German, also *The Colonization of New England*, which was translated into English by the younger Hazlitt. Returning to New York, she wrote in English, *Heloise, or the Unrevealed Secret; Life's Discipline, a Tale of the Annals of Hungary; The Exiles*; and numerous contributions to German and American periodicals. She died at Hamburg in 1870.

ROBINSON, WILLIAM E., b. Tyrone co., Ireland, 1814; having obtained a classical education came to this country in 1836, studied at Yale college, and graduated from the Yale law school. He was regular correspondent of the *New York Herald* 1838-44, and for the *Tribune* over the signature of *Richelieu* 1848-49. He edited *The People*, a weekly newspaper; practiced law in New York 1853-62, went to Europe in 1859; was U. S. assessor of internal revenue 1862; in congress 1867-69. He has published several fugitive poems, and delivered lectures, speeches, and addresses.

ROBISON, JOHN, a celebrated Scotch natural philosopher, was b. at Boggall, in the parish of Baldernock, Stirlingshire, in 1739, and after a preliminary training at the grammar school of Glasgow, entered the university of that city in Nov., 1750, and took his degree in 1756. He was engaged to accompany Edward, duke of York, to sea, as his instructor in mathematics and navigation; but this arrangement being abandoned, Robison accompanied in a similar capacity the son of admiral Knowles (1758 to 1762). He afterward obtained the responsible office of taking charge of the Harrison (q.v.) chronometer in its trial trip across the Atlantic; and on his return (April 1763) from this expedition, for which he was never remunerated, he returned to Glasgow to commence the curriculum of divinity study. He happened, however, at this time to renew his acquaintance with James Watt and Dr. Black, and his former strong predilection for physical science underwent a vigorous revival, and was cultivated with such success that

in 1766, when Black was transferred to the university of Edinburgh, Robison succeeded him. In 1770 his old friend, admiral Knowles, having been recommended by the British government to the czarina Catharine II. as the fittest person to reform the ship-building and naval administration of Russia, accepted the appointment of president of the Russian board of admiralty, and persuaded Robison to accompany him as secretary. Robison remained in Russia for several years, and rose high in the opinion of government, which conferred upon him various offices, both honorable and profitable. But the chair of natural philosophy in Edinburgh having become vacant in 1773, Robison was unanimously elected, and despite the extremely tempting and flattering offers of the Russian government, he accepted the chair (1774). On leaving Russia a pension was settled on him, and he agreed to take charge of two or three of the young cadets, his former pupils. To the performance of his professorial duties, Robison brought talents and acquirements of a high order; his knowledge was extensive, and included the latest discoveries of both British and foreign philosophers; his language was precise and fluent; and his views of his subject ingenious and comprehensive. But, on the other hand, his diction was too rapid, and he unfortunately disapproved of experiments, and employed them as little as possible in illustrating the great principles of natural science. In 1783 Robison joined with principal Robertson and other eminent men in reviving the old literary and scientific society (which had been founded in 1739 under the direction of Mr. Maclaurin, and had been in a languishing state since 1756), which was now incorporated by royal charter, and became the philosophical society. The *Transactions* of this society contain several works from Robison's pen, which are held in high esteem; and his contributions to the *Encyclopædia Britannica* were the means of elevating that work to the rank of a valuable and trustworthy book of reference. He published *Black's Lectures on Chemistry* (1803), and also a portion of a work of his own, entitled *Elements of Mechanical Philosophy*, which, together with some MSS. intended to form part of a second volume, etc., was re-published by sir David Brewster in 4 vols. (1822), with notes. On Jan. 28, 1805, he was seized with a severe recurrence of a former illness, brought on by a cold, and died two days afterward.

ROB ROY, the popular name of ROBERT M'GREGOR, a celebrated Scottish outlaw, whose singular adventures entitle him to be considered the Robin Hood of Scotland. He was b. between the years 1657 and 1660, and was the second son of Donald M'Gregor of Glengyle, by a daughter of Campbell of Glenlyon. Rob Roy, in consequence of the outlawry, in 1660, of the clan M'Gregor by the Scottish parliament, assumed the name of Campbell. In Gaelic, the name *Roy* signifies *red*, and was applied to him from his ruddy complexion and color of hair. Rob Roy received a fair education, and in his youth was distinguished for his skill in the use of the broadsword, in which the uncommon length of his arms was of much advantage. It was said that he could, without stooping, tie the garters of his Highland hose, which are placed two inches below the knee. Like many of the Highland proprietors of the period, Rob Roy dealt in grazing and rearing black-cattle for the English market. He took a tract of land for this purpose in Balquhiddy; but his herds were so often stolen by banditti from Inverness, Ross, and Sutherland, that, to protect himself, he had to maintain a party of armed men, to which may be attributed the warlike habits he afterward acquired. He also protected his neighbors' flocks, in return for which he levied a tax, which went under the name of "black mail." Rob Roy married a daughter of the laird of Glenfalloch, shortly after which he acquired the estates of Craig Royston and Inversnaid, near the head of Loch Lomond. In consequence of losses incurred in unsuccessful speculations in cattle, for which he had borrowed money from the duke of Montrose, Rob Roy lost his estates, which were seized by the duke, on account of this debt. Rob Roy rendered desperate by his misfortunes, collected a band of about twenty followers, and made open war upon the duke, sweeping away the whole cattle of a district, and intercepting the rents of his tenants. That this could happen at so late a period, and in the immediate neighborhood of the garrisons of Stirling, Dumbarton, and Glasgow, appears almost incredible; but Rob Roy enjoyed the protection of the duke of Argyle and the respect of the country people, who gave him timely information of the designs of his enemies. Numberless stories are still current in the neighborhood of Loch Lomond and Loch Katrine of his hairbreadth escapes from capture by the troops. At one time, a reward of £1000 was offered for his head, in consequence of which he was obliged to take shelter in a cave at the base of Ben Lomond, on the banks of the lake, which had in former times afforded a secure retreat to Robert the Bruce. Many instances have also been recorded of his kindness to the poor, whose wants he often supplied at the expense of the rich. Rob Roy was not the commonplace *cateran* that many people think him. He gave his sons a good education, and died peaceably in his bed about the year 1738. His funeral was attended by all the people of the district, with the exception of the partisans of his enemy, the duke of Montrose. Rob Roy's exploits have been immortalized by sir Walter Scott in his celebrated novel of *Rob Roy*, written in 1817.

A circumstance little known in connection with Rob Roy's literary tastes is, that in the list of subscribers to Keith's *History of the Affairs of Church and State in Scotland*, published in 1734, there occurs the name "Robert Macgregor, alias Rob Roy."

ROC, or **Rock**, a fabulous bird, represented as of immense size, and "able to truss an elephant" in its talons. It is perhaps enough to refer to the *Arabian Nights' Entertainments* as to the size and power of the roc. A belief in its existence prevailed throughout the middle ages, and it is noticed in many works of that period. The fables concerning the roc may have originated in exaggerated stories of some of the great eagles, or of the Lammergeier.

ROCAMBOLE, *Allium scorodoprasum*, a plant of the same genus with garlic, onion, leek, etc., and nearly allied to garlic, which it resembles in its habit, although larger in all its parts. The upper part of the stem is in general spirally twisted before flowering. The root forms rounder cloves than those of garlic, and of much milder flavor; the umbels are also bulbiferous. Rocambole has long been cultivated in kitchen gardens, although it has never become very common in them. It is a native of sandy soils in Denmark and other countries near the Baltic.

ROCELLA. See **ARCHIL**.

ROCH or **ROCK ALUM**, a name formerly given to pure alum in mass; but it is now applied to a particular variety found at Civita Vecchia, in the Roman states. It is a kind of native alum, free from iron, but having a reddish color, derived from the soil in which it is found. It is also called Roman, and red alum. A factitious kind is now in general use, made of common alum reddened with Armenian bole.

ROCHAMBEAU, **JEAN BAPTISTE DONATIEN DE VIMEUR**, Comte de, 1725-1807; a French general, early promoted for skill in military maneuvers, distinguished at the siege of Maestricht in 1748, and in many subsequent battles. In 1780, with the rank of lieutenant-gen., he was at the head of the expedition of 6,000 French soldiers sent to the assistance of the Americans under Washington. The union of the French with the American forces accomplished the surrender of the British forces in Yorktown, and virtually closed the revolutionary war. Congress voted the thanks of the nation to France, Rochambeau, and his troops; and presented him with cannon captured at Yorktown. In 1783 he was made governor of Picardy and Artois, and in 1791 marshal. He sympathized with the early work of the French revolution and served as commander of the army of the north under Demouriez, but retired to private life after the execution of Louis XVI; was suspected by the Robespierre faction and imprisoned, escaping the guillotine by the fall of the dictator in 1793. He was then released, and when Napoleon came to power was restored to his rank and former position. His memoirs in 2 vols. were published in 1809 and translated in 1838.

ROCHDALE, a thriving manufacturing t. of Lancashire, a market-town and parliamentary and municipal borough, in the valley of the Roche, and built on both sides of that stream, 11 m. n.n.e. of Manchester, and 200 m. n.w. of London by railway. The parish church, placed on an eminence, and approached by a flight of steps, is a venerable edifice, dating from the 12th c., and built partly in late Norman, and partly in perpendicular. The other public buildings comprise churches, chapels, and meeting-houses for the various dissenting sects. The new town-hall, completed in 1867, is a fine building in domestic Gothic style. The public baths, opened in 1868, are the property of the corporation. Many improvements in the architectural and sanitary condition of the town have been made within recent years. With all the improvements, however, Rochdale is beautiful only in site, and derives its importance wholly from its extensive and varied manufactures. The woolen manufacture, introduced here by a colony of Flemings in the reign of Edward III., is in a prosperous state, and is increasing in importance. Blankets, baizes, kerseys, and other woolen fabrics are the staple manufactures. Cotton goods also, especially calicoes, are largely manufactured. In the vicinity, coal is found, and flagstones, freestones, and slates are abundantly quarried. A good general trade is carried on; there are several hat-factories, cotton-mills, machine-shops, iron and brass foundries, etc. There are weekly markets for woolen goods and grain, and fortnightly fairs for cattle. The commerce of the town is facilitated by abundant means of communication. Pop. '71, of municipal borough, 44,559. Rochdale returns one member to the house of commons.

ROCHEFORT-LUCAY, **VICTOR HENRI**, Comte de; b. Paris, 1830; of a distinguished family, some of whom had been chancellors of France. His father was a pronounced royalist; but his mother, a radical sympathizer with political progress of all kinds, educated Henri to abhor caste under whatever guise. He was a timid youth of feeble health but of rare nervous and mental power. Soon after his graduation he became the sole support of his mother and three sisters, finding employment in a government office in 1851. At this time he was engaged to write theatrical criticisms for the *Charivari*, where he made himself felt by the vigor of his style, and became a favorite by his brilliant social qualities and wit free from malice. In 1860 baron Hausemann procured him an appointment and an improved salary. In 1863 he became one of the editors of the *Figaro*, where his style was recognized as that of an editorial master and he signed his articles with his full name. In 1866 he began those rigorous thrusts at the Napoleonic government which caused the paper to be interdicted until the publisher dropped Rochefort from its editorial staff. He then collected his political articles and published them in volumes entitled *Français de la Décadence* in 1866, *La Grande Bohême*,

1867, and *Signes du Temps*, 1868. The repeal of the most arbitrary restrictions on the press in 1868 enabled Rochefort to start a journal of his own called the *Lanterne*, a weekly which soon obtained an immense circulation, and brought the government's friends to his attack by law, by defamation, and by personal violence. The 11th number was seized, the editor arrested and convicted of disrespect of the government, sentenced to a year in prison, a fine of 10,000 francs, and deprivation of civil and political rights. He escaped to Brussels, continued the publication of the *Lanterne* there; and spite of the most rigorous police exclusion it was largely read in France; and by translations made into English, German, and Italian papers its articles came into France in a thousand ways. In 1869 a district in Paris nominated him for the legislative assembly, when Jules Grévy was elected. The same year he was permitted to return to Paris by discontinuing the *Lanterne*, when he was elected to the assembly and took his seat Dec., 1869. He there exhibited his disposition to overthrow the government; started the *Marseillaise*, in a similar style to the *Lanterne*, and attracted the animosity that led Pierre Bonaparte to murder his associate editor Victor Noir. For editorials immediately following this outrage he was again sent to prison, but permitted to appear as a witness at the trial of Pierre Bonaparte, where his testimony was given with an unexpected moderation of language. On the break-up of the imperial government following the French defeats in 1870, Rochefort gained his liberty and became a member of the provisional government. After the capitulation of Paris, Jan., 1871, he founded the *Mot d'Ordre*, which defended Gambetta's policy. Elected to the national assembly at Bordeaux, he remarked that "this time the republicans shall not be juggled out of the republic." He imagined Thiers not friendly to a republic; and finding his influence, and that of persons still less friendly, predominating, he resumed the direction of his journal in Paris and threw himself into the movement to organize in the capital a government opposed to that in Versailles. The organizers of that government had no sympathy with the wild spirit of destructiveness which ruled in Paris after its defeat, but they were held responsible for the consequences. After the surrender of Paris to the national troops, Rochefort was tried and condemned for his action, sent to prison, and two years later sent to the penal colony of New Caledonia in the Pacific. He escaped with friends in 1874, returned via San Francisco, New York, and London, and revived the *Lanterne* in Geneva, Switzerland. The general amnesty of July 11, 1880, permitted his return to Paris, where he has established a journal named *L'Intransigeant*.

ROCHEFORT-SUR-MER, an important sea-port and naval arsenal of France, in the dep. of Charente-Inférieure, stands on the right bank of the Charente, 5 m. from its mouth. It is surrounded by ramparts, and protected by forts at the mouth of the river; and is a modern, clean, well-built town. Few French towns can be compared with Rochefort-sur-Mer for the number and importance of its public works. The harbor, which is one of the three largest in France, is deep enough to float large vessels at low water. Rochefort-sur-Mer has fine wharfs, extensive magazines, dock-yards, rope-walks, cannon foundries, and other establishments designed for the manufacture and preservation of naval stores and marine apparatus of every kind, including extensive bread and biscuit stores. The most celebrated of its many institutions are the marine hospital, founded in 1787, and provided with 1240 beds for seamen, besides wards for invalided officers; the artillery and naval schools for every branch of the profession, and the general civil college. Its convict-prison, which had accommodation for 1000 prisoners, has been disused since 1852, and the convicts are now transported to Cayenne. In addition to the extensive trade arising from the special character of the place, Rochefort-sur-Mer is the center of the commerce of the department, and is largely engaged in colonial trade, in the manufacture of brandy, and in the building of men-of-war and merchant-ships, steamers, and coasting vessels. Pop. '76, 25,454.

ROCHEFOUCAULD, an old French family of great celebrity, whose original seat was the small town of Laroche foucauld, near Angoulême. The history of the family is traced back to 1026, when a certain Foucauld, first seigneur de la Roche, is spoken of in a charter of an abbey of Angoulême as *vir nobilissimus Fulcaudus*. In the religious wars of the 16th c., it embraced the cause of the Protestants. FRANÇOIS, DUC DE L., and PRINCE DE MARSILLAC, born 1613, was much attached to literary pursuits; and after having been involved in intrigues against cardinal Richelieu, and in the tumults of the Fronde, he retired into private life, cultivated the society of the most eminent literary persons of his time, Boileau, Racine, and Molière, and composed his famous *Mémoires* (Cologne, 1662; Amst. 1723, etc.), in which he gives a simple but masterly historic account of the political events of his time. In 1665 he published also his *Réflexions ou Sentences et Maximes Morales*, a work containing 360 detached thoughts, of which, perhaps, the most widely celebrated is his definition of hypocrisy, as "the homage which vice renders to virtue." The book is regarded as a model of French prose, and exhibits much acuteness of observation, and a clear perception of the prevalent corruption and hypocrisy of his time. He died Mar. 17, 1680. His *Œuvres Complètes* were edited by Depping (Par. 1818), and his writings have been commented on by a host of critics of the most different schools, as Voltaire, Vinet, Sainte-Beuve, and Victor Cousin.—FRANÇOIS ALEXANDRE FRÉDÉRIC, DUC DE L.-LIANCOURT, an eminent philanthropist, born Jan. 11, 1747, was representative of the nobles of Clermont in the

states-general, and was a zealous advocate of reform, but sought to preserve the monarchy. After the catastrophe of Aug. 10, he fled to England, and lived in great penury, till he obtained back, in 1794, some fragments of his property. He now visited North America, and afterward published his *Voyage dans les Etats-Unis d'Amerique fait en 1795-97* (8 vols. Par. 1798). Having returned to Paris, he lived for some time in retirement, occupied only with the extension of vaccination and similar works of benevolence. Napoleon restored him his ducal title in 1809. After the restoration, he was made a peer, but soon gave offense to the court, by opposing its unconstitutional policy. He labored zealously in promotion of many patriotic and philanthropic objects. He founded the first savings bank in France. He died Mar. 27, 1827.

ROCHELLE. See LA ROCHELLE.

ROCHELLE SALT is the popular name of the tartrate of soda and potash ($\text{NaO}, \text{KO}, \text{C}_2\text{H}_3\text{O}_6 + 8 \text{Aq}$), this salt having been discovered, in 1672, by a Rochelle apothecary named Seignette. It occurs, when pure, in colorless transparent prisms, generally eight-sided; and in taste it resembles common salt. It is prepared by neutralizing acid tartrate of potash (formerly known as bitartrate) with carbonate of soda. After a neutral solution has been obtained, it must be boiled and filtered, and the resulting fluid must be concentrated till a pellicle forms on the surface, when it must be set aside to crystallize.

This salt is a mild and efficient laxative, and is less disagreeable to the taste than most of the saline purgatives. From half an ounce to an ounce, dissolved in eight or ten parts of water, forms an average dose. A dram of Rochelle salt added to one of the ingredients of an effervescing draught (bicarbonate of soda or tartaric acid, for example), forms one of the varieties of what are called seidlitz powders.

ROCHESTER, a city the co. seat of Olmsted co., Minn., on the Zumbro river, and the Winona and St. Paul railroad; pop. '70, 4,344. It has a court-house, a public library, churches, newspapers, hotels, foundries, machine shops, manufactories of furniture, wagons, etc.

ROCHESTER, a city of New York, is on the Genesee river, 7 m. s. of its entrance into lake Ontario, where it is crossed by the Erie canal and the Central railway, and is the terminus of the Genesee Valley canal and railway, 229 m. w.n.w. of Albany. In the center of the city are the upper falls of the Genesee, a perpendicular cataract of 96 feet. Two other falls of 84 and 25 ft. are a mile and a half below, the river running through a deep gorge in its limestone banks, from 100 to 220 ft. high. The city is well built, chiefly of bluish limestone, with broad shaded streets, and there are nearly as many houses as families. The falls give water-power to numerous large flour-mills and other manufactories. The canal crosses the river on a handsome aqueduct of seven arches. There are 57 churches, 20 public schools, 41 academies, a university, theological seminary, atheneum, Protestant and Catholic hospitals, a reformatory and county offices, 5 banks and 4 savings banks, with 10,000,000 dollars on deposit, 4 daily and 10 other papers. The rural cemetery of Mount Hope is one of the ornaments of the city. The suburbs are highly cultivated, having 4,000 acres of fruit-trees, and nurseries of 250 to 500 acres. The nursery trade of Rochester is not surpassed by that of any other place in the world. There is a good harbor at the mouth of the river, and a considerable commerce by the lake. Rochester was settled in 1810; in 1820 its population was 1502; in 1840, 20,191; in 1860, 48,243; in 1870, 62,386; in 1875, 81,813.

ROCHESTER (*ante*) became an incorporated village in 1817 and took its name from Nathaniel Rochester, an American pioneer, who first laid it out. In 1834 it received its charter as a city, and has since steadily prospered. By the census of 1880 the population was 89,363, an increase of 7,550 since 1875. The great water-power furnished by the Genesee river, together with the facilities for transportation and the fertility of the surrounding country, has contributed to its growth. It is the county seat of Monroe co. and is situated on both sides of the Genesee, which divides it into almost equal parts. The site is elevated, covers an area of about 17 sq. m., and is laid out chiefly in squares with streets generally shaded and from 60 to 100 ft. in width. The principal business thoroughfare, Main street, is in the center and crosses the river over a handsome bridge. Among the chief buildings are the city hall, of blue limestone, with a tower 175 ft. high; the county court-house; the free academy, or high-school building; the Powers building, used for business purposes; and the Rochester savings bank. The manufactories are extensive and varied. In earlier years flour was the chief product, and, although now dwarfed by other industries, it is still of importance, there being 18 mills, grinding annually 2,500,000 bushels of wheat. The largest industry, however, is the manufacture of ready-made clothing, which uses a capital of \$2,500,000, employs 6,500 hands, and produces goods annually valued at \$5,500,000. The manufacture of boots and shoes ranks next, for which about \$1,250,000 are used as capital. The Leighton iron bridge works employ 300 men, and produce material yearly valued at \$1,000,000. Other manufactories in the city are the Stewart rubber company, 18 breweries, 5 tobacco factories, and 1 carriage factory. The nursery business yields an average yearly product of about \$1,000,000. The foreign commerce of the city is carried on chiefly by the lakes, though some of it goes and comes by way of New York. In 1875 the exports amounted to

\$784,979; the imports to \$331,609. A net-work of railroads affords advantages for transportation. The city is divided into 16 wards, and is governed by a mayor and a common council consisting of two aldermen from each ward. The board of education consists of one commissioner from each ward, chosen by the people every three years. The assessed valuation of property in 1875 was \$61,351,700, which is believed to be only about three-fourths of the real value. In March of the year mentioned the city debt amounted to \$5,000,000, and the city owned property, exclusive of its expensive water-works, valued at \$2,000,000. The public schools employ about 180 teachers, and usually have enrolled as many as 11,000 pupils. The university of Rochester was established in 1850 by the Baptists. It is situated in the eastern part of the city, where it possesses 23 acres of ground, handsomely laid out, and occupies large buildings of dark-red sandstone. The religious denominations of the city are 5 Baptist, 1 Christadelphian, 1 Congregational, 7 Episcopal, 5 German Evangelical, 2 Friends, 2 Jewish, 2 Lutheran, 9 Methodist, 10 Presbyterian, 1 Reformed Church in America, 11 Roman Catholic, 1 Second Advent, 1 Unitarian, and 1 Universalist.

ROCHESTER, an episcopal city, parliamentary and municipal borough, and river-port of Kent, stands between Chatham (q. v.) on the e., and Strood on the n. w., on the right bank of the Medway, 36 m. e. s. e. of London, by the London, Chatham, and Dover railway. Together with Chatham and Strood, it forms in effect one large town. The city is surrounded on two sides by the river; and its ancient castle and cathedral, the numerous martello towers along its shores, and the works connected with the Chatham lines of fortification, render its appearance highly striking. The bishopric of Rochester was founded in 604; but the early Saxon cathedral suffered from the ravages of the Danes, and was in a completely ruined condition at the time of the Norman conquest. Gundulf, who was consecrated bishop of Rochester in 1077, began to rebuild the cathedral and the priory connected with it; the dormitory, chapter-house, and refectory were added under the succeeding bishop; and the new cathedral was dedicated in 1130, in presence of the king and a great company of bishops. The cathedral, the nave and crypt of which are Norman, and the choir and transepts early English, is 310 ft. long, and the western transept is 123 ft., and the nave and choir 68 ft. broad. Of the ancient Norman priory, only a small fragment remains. The castle, crowning an eminence, and overlooking the cathedral, is a Norman keep, built in a wonderfully strong and solid style of masonry. Rochester imports coal and exports hops. In 1875, 4,138 vessels, of 493,575 tons, entered the port, and 3,151, of 217,260 tons, cleared. Rochester returns two members to the house of commons. Pop. '61, 16,862; '71, 18,352.

Rochester, which is surmised to have existed prior to the Roman invasion, was called by the Romans *Durobrive*, and, according to Bede, derives its present name (*Hrofs-ceaster*, Hrof's castle) from that of Hrof, a Saxon chieftain.

ROCHESTER, JOHN WILMOT, second Earl of, has left a name notorious for wit and profligacy. He was b. April 10, 1647, at Ditchley, Oxfordshire, his father being Henry, first earl, better known as the lord Wilmot of Clarendon's *History*. He was entered of Wadham college, Oxford, when only 12 years of age; and at 14 was, with other persons of rank, made M. A. by lord Clarendon in person. After traveling in France and Italy, he attached himself to the court, and rose high in favor with Charles II., who made him one of the gentlemen of the bedchamber, and comptroller of Woodstock park. In 1665 he went to sea in the fleet commanded by the earl of Sandwich, and behaved at Bergen with great intrepidity. His account of the attack is described in a letter to his mother given in Wordsworth's *Ecclesiastical Biography*. He had entered into a formal engagement with his friend Mr. Windham, "not without the ceremonies of religion, that if either of them died, he should appear, and give the other notice of the future state, if there was any." Windham was killed in the action, but did not afterward disturb the repose of his friend. Rochester incurred the displeasure of the king, and was committed to the tower, for the forcible abduction of a celebrated beauty and heiress, Miss Mallett, who was rescued by her friends, but whom he subsequently married before he was 20 years old. His wit and love of pleasure made him the favorite of a dissolute court. He once harangued the populace as a mountebank from a stage on Tower hill, and is said to have occasionally persuaded the "merry monarch" to disguise his rank, and accompany him in the pursuit of frolic and adventure. His genius and activity of mind led him to withdraw at times from scenes of gallantry and licentious merriment. He cultivated the muses with success, and Anthony Wood speaks of him as the greatest scholar among the nobility of his day. As he grew older, he gave less of his time to study, and more to the company of vicious companions, and indulgence in wine. His constitution being undermined by excess and voluptuousness, he died at the early age of 34. Bishop Burnet has left an interesting account of his death under the title of *Some Passages of the Life and Death of John Earl of Rochester*, from which it appears that he became a sincere convert to the truth of Christianity, and sincerely repented his immoral and dissolute courses. He wrote some love-songs, an elegant *Imitation of Horace on Lucilius*, a *Satire against Man*, in which he is much indebted to Boileau, and an *Essay on Nothing*, which is perhaps his best performance.

ROCHESTER, NATHANIEL, 1752-1831; b. Va.; merchant at Hillsboro, N. C.; maj. and commiss.gen. in the revolutionary war. He led the forces which captured the

British gen. McDonald and his regiment of Scots at Wilmington. He was a member of the convention which framed the constitution of North Carolina. Subsequently he removed to Maryland and engaged in manufacturing at Hagarstown. In 1800 he became the owner of large tracts of land on the banks of the Genesee river, and settled in Rochester, N. Y., which was named in his honor.

ROCHESTER, UNIVERSITY OF, in the city of Rochester, N. Y.; a Baptist institution, established in 1850. It discarded the dormitory system from the beginning, and exercises no watch over students out of recitation hours. Its grounds, which are beautifully laid out, are in the eastern part of the city, and the university building is a massive structure of dark red sandstone, 150 ft. long, 80 ft. wide, and three stories high. It has an invested fund of \$212,000, and real estate valued at \$378,000. The library, for which a fire-proof building is provided, contains 11,500 volumes, and the geological cabinets are among the best in the country. Three courses of study are open to students—the classical, the scientific, and the eclectic. Professors in 1878, 9; students, 146. Martin B. Anderson, LL.D., president.

ROCHET (Lat. *rochetus*, or *rochettus*), a portion of the church costume of bishops, abbots, prelates, canons of certain privileged chapters, and some other dignitaries. It is usually of lawn or lace, and is of the form of a surplice, but with close-fitting sleeves. In the Latin church its use is very ancient, although its form has varied at different times. In the first prayer-book of Edward VI., which preserved a considerable part of the Roman episcopal costume, the rochet was ordered to be worn by bishops in the communion service. The rochet, however, must not be confounded, as is often done by writers on clerical costume, with the dalmatic and tunic, tight and close-fitting vestments of colored silk, worn by bishops under the *planeta* (q.v.).

ROCHETTE, DESIRÉ RAOUL, 1790–1854; b. and educated at Bourges; in Paris, at the age of 21, he assisted Guizot in the professorship of modern history in 1815; editor of the *Journal des Savans* in 1816, and in various government service until 1828, when he was a member of the scientific commission to the Morea. His *Lectures on Ancient Art*, translated into English, were published in London, 1854.

ROCK. Though popularly restricted to masses of indurated matter, this term is extended by geologists to all substances which make up the crust of the earth, whether they be loose and friable like soil and sand, or compact and indurated like limestone and granite. The rocks of the earth's crust will be found described under the heads **AQUEOUS** and **IGNEOUS ROCKS**, to which the reader is referred.

ROCK, a kind of sweetmeat, made of sugar, sometimes mixed with almonds and various flavoring materials. The sugar is first boiled, and then poured out upon a cold marble slab, and worked up into a rough mass.—The term is also frequently applied to another form of sweetmeat, in which the sugar, whilst hot and soft, is pulled repeatedly over a smooth iron hook, until it becomes white and porous. This is also flavored with peppermint or other essences.

ROCK, a co. in s.w. Minnesota, adjoining Iowa, watered by Rock river, and Chan-narambe and Beaver creeks, on a branch of the Sioux City and St. Paul railroad; about 475 sq.m.; pop. '80, 3,669—2,654 of American birth. The surface is rolling. The soil is fertile. The principal productions are wheat, corn, grass, oats, and live stock. Co. seat, Luverne.

ROCK, a s. co. in Wisconsin, bordering on Illinois; crossed by the Chicago and North-western, the Western Union, and the Milwaukee and St. Paul railroads. It is drained by Turtle and Sugar creeks, and by Rock river, which runs through the center and divides the county; 700 sq.m.; pop. '80, 38,823. The surface is mostly level, and abounds in rich prairie land—that lying e. of the river being known as Rock prairie. The soil is fertile, and tobacco, hops, wool, grain, and honey are the principal products; horses, sheep, cattle, and swine are raised in great numbers. It contains numerous manufactories of agricultural implements, machinery, furniture, carriages and wagons, also flour mills. The county has some fine scenery, and hard wood is abundant. Co. seat, Janesville.

ROCKALL stands on a sand-bank in the north Atlantic ocean; this bank is nearly 100 m. in length, and 40 in breadth. The rock itself is situate in 57° 35' n. lat., 13° 40' w. long., about 300 m. w. of north Uist, in the outer Hebrides, and is of a rounded form, rising about 18 or 20 ft. above the sea. It is frequented by large flocks of sea-birds, and the place was found some years ago to be surrounded by considerable shoals of the larger kinds of fish, chiefly *gadide* and *pluronectide*. A company was formed in 1861 to carry on a fishery at the place; but the supply not proving so great as was anticipated, and the distance from the markets being very considerable, the speculation proved to be very unprofitable. There are still a few fish about Rockall, but they are caught by private fishermen.

ROCKBRIDGE, a co. of w. Virginia, bounded by the Blue Ridge on the s.e., forms a part of the great valley of Virginia. It is intersected by the Chesapeake and Ohio railroad; and drained by the North, South, Calf Pasture, and James rivers; 700 sq.m.; pop. '80, 20,003. The surface is mountainous, with forests of maple, chestnut, oak, and

tulip trees. The soil is very fertile; main productions are corn, wheat, oats, hay, wool, tobacco, and sorghum. It contains manufactories of tin, copper, and sheet-iron ware, and tanneries for tanned and curried leather, and numerous flour mills. The county derives its name from a natural arch formed of rocks, in the southern part, which rises some 200 ft., and spans Cedar creek. The James River canal passes through the southern part. Co. seat, Lexington.

ROCK BUTTER, a mineral substance, consisting of alum (q.v.), mixed with alumina and oxide of iron, of a pasty consistency, and appearing as an exudation oozing out of rocks which contain alum. It is always greasy to the touch, but is often hard enough to exhibit a straight foliated fracture. It is very easily broken. It occurs in most of the places where alum is procured.

ROCK CASTLE, a co. in s.e. central Kentucky; drained by the Rock Castle and Dick's rivers; traversed by the Louisville and Great Southern railroad; 280 sq.m.; pop. '80, 9,670—9,629 of American birth, 437 colored. The surface is uneven and heavily wooded; corn, grass, oats, and pork are the staples. Bituminous coal is found. Co. seat, Mount Vernon.

ROCK, COCK OF THE, *Rupicola aurantia*, a bird of the order *insessores*; tribe *dentirostres*; family *pipridæ* (manakins, etc.), regarded by many as a sub-family of *ampelidæ*. The *pipridæ*, or manakins, are a pretty large group of birds, many of them of very curious and beautiful plumage, most of them inhabitants of America, and only of the tropical parts of it. They have the bill broad at the base, the nostrils at the side nearly hidden by feathers; the wings rather short, but pointed; the tail very short and even; the legs (*tarsi*) long and slender. In the genus *rupicola*, the bill is strong; and the species sometimes called *rock-manakins* are comparatively large birds, having a double vertical crest on the head, with the feathers disposed in a fan-like manner. The cock of the rock is a native of Guiana and of other north-eastern parts of South America. It is remarkable for its bright orange-colored plumage—the quill-feathers of the wings, however, being black, and the tail tipped with yellow—its large crest overhanging the bill, and its wary habits. It is a solitary bird, inhabiting rocky places, retiring into a hiding-place during the day, and coming forth to feed at sunrise and sunset. The tips of the crest-feathers are tinged with brown and yellow. The wing-coverts and upper tail-coverts are loose flowing plumes, giving a resemblance to gallinaceous birds. The size is about that of a common pigeon.—The Peruvian cock of the rock (*R. Peruviana*) is less brilliant in plumage than the Guiana species.

ROCK CRYSTAL, a popular and partly also a scientific name for the finest and purest quartz (q.v.), seldom applied, however, to small crystals which are mere six-sided pyramids, but more generally to those in which the six-sided prism is well developed. The name is sometimes limited to colorless and perfectly transparent quartz, but is also more rarely extended to that which is violet or amethystine (*amethyst*, q.v.), red (*Bohemian ruby* or *Silesian ruby*), wine-yellow (*citrin* or *gold topaz*), brown or smoky (*smoke quartz*, *Cairngorm stone*), etc. The beauty of specimens of rock crystal is sometimes very great. The crystals are sometimes slender, crossing and penetrating each other in exquisite groups. They sometimes inclose other substances, which are beautifully seen through the transparent rock crystal, as slender hair-like or needle-like crystals of hornblende, asbestos, oxide of iron, rutile or oxide of titanium, oxide of manganese, etc., and such specimens are known by various fanciful names, as *Thetis's hair-stone*, *Venus's hair-stone*, *Venus's pencils*, *Cupid's net*, *Cupid's arrows*, etc.; and sometimes the inclosed substances are small spangles of iron-glance, or crystals of iron pyrites, or native silver in fern-like leaves, or spangles of gold. Very large crystals of perfectly pure rock crystal are sometimes found. One found in the Alps, and which was among the treasures carried from Italy by the French in 1797, is 3 ft. in diameter, and weighs 8 cwt. Rock crystal was prized by the ancients, and was used by them, as it still is, for vases, cups, seals, etc. An important modern use of it is for lenses of spectacles, etc., its hardness rendering it much less liable to be scratched than glass. Lenses of rock crystal are often called *pebble lenses*.

ROCKDALE, a co. in n. central Georgia; drained by the Ocmulgee river; traversed by the Georgia railroad; 180 sq.m.; pop. '80, 6,838—6,829 of American birth, 2,688 colored. The surface is uneven and not very fertile. The county was formed within the last ten years. Gold and iron are found in small quantities. Co. seat, Conyers.

ROCKET, a name given to a number of plants of the natural order *cruciferae* and belonging to the genera *brassica*, *sisymbrium*, *erysimum*, *barbarea*, *hesperis*, etc.—**GARDEN ROCKET** (*brassica eruca*, or *cruca sativa*) is an annual plant, a native of Austria, with stem 2 ft. high, upright and branching; the leaves smooth, succulent, cut, and toothed. When in flower, it has a strong, peculiar, and disagreeable smell; but when it is very young, this smell is almost imperceptible, and the leaves are used as a salad, for which it is frequently sown on the continent of Europe, and was formerly cultivated also in Britain.—The name **GARDEN ROCKET** is also given to *hesperis matronalis*, also called *Dame's violet* (q.v.), a favorite ornament of our flower-border.—The **YELLOW ROCKET** of our flower-borders is a double-flowered variety of *barbarea vulgaris* (see **CRESS**).—

The WILD ROCKET (*Sisymbrium officinale*, or *erysimum officinale*) is common in Britain, and is sometimes sown and used as a spring pot-herb.

ROCKET is a firearm capable of taking effect at a long range. The rocket consists of a light tubular case of pasteboard, or thin metal, charged to the muzzle with a composition consisting of saltpeter 68 parts, sulphur 12 parts, charcoal or meal powder 32 parts. This composition is rammed hard into the case, the center being left void. To the rocket is attached a long stick, which serves (like the tail of a kite) to straighten its course. See PYROTECHNY. When lighted at the end the stream of gases propels the mass on the principle explained under BARKER'S MILL. As a mere firework, rockets are made of a few ounces in weight; as intended to throw light upon a town or a hostile work, they average from $\frac{1}{2}$ lb. to 2 lb. These light rockets were improved by sir William Congreve, who so contrived them, that, when over the necessary point the rocket discharged a number of light balls, which burned in the air for several minutes with great brilliancy, while others at the same point released small parachutes, which sustained a bright light for a still longer time. But sir William Congreve did more: he converted the rocket into a terrible weapon of war, with ranges which no ordnance of that day could attain. Discarding the small sizes, he made 12-lb., 18-lb., and 32-lb. rockets, which he charged with canister-shot, bullets, and other missiles. The stick for a 32-lb. rocket is 18 ft. in length, and the maximum range 3,500 yards. The range can be also increased by discharging the rocket from a cannon, with a time-fuse to ignite it at the cannon's utmost range, when the rocket commences its own course. As missiles, these rockets are found to annoy most seriously the defenders in any fortified work, and, in a bombardment, they speedily set houses and buildings on fire. In the field, also, the plunging, ricochetting motion of the rocket greatly disturbs both cavalry and infantry. The Congreve rockets were first tried on actual service, and with fatal effect, at the attack on Copenhagen in 1807. One great advantage in a rocket is, that it has no recoil against the stand from which it is fired; the largest rocket may therefore be discharged without danger from the smallest boat; consequently, in naval attacks on maritime fortresses, a flotilla of rocket-boats is a very common auxiliary. For the use of rockets in shipwrecks, see LIFE MORTARS and ROCKETS.

ROCK-FISH. See WRASSE.

ROCKFORD, a city of Illinois, on the Rock river, 92 m. w.n.w. of Chicago, on the Chicago and Galena railway. It is the center of a rich country, with county buildings, 6 banks, 5 newspapers, 16 churches, and factories supplied with water-power by the river. Pop. '70, 11,049.

ROCKFORD (*ante*), a city in n. Illinois, incorporated 1852; called the "forest city;" pop. '80, 13,088. It is on the Freeport line of the Chicago and Northwestern railroad, the terminus of the Kenosha and Rockford branch, and the Chicago and Iowa railroads. It is lighted by gas, has many fine residences, and is supplied with water by the Holly system, at a cost of \$225,000. The water-works are supplied from springs, and the water is raised by machinery which pumps 3,000,000 galls. of water in 24 hours, running at the rate of 39 revolutions per minute, through 21 m. of pipe. The river is here crossed by a handsome iron bridge, and the Rockford Hydraulic company have built a dam across it 800 ft. long. It has 6 banks—4 national, 1 state, and a private bank, with deposits amounting to \$1,350,000. It has public schools; the Rockford seminary for girls, founded 1849; a fine museum and collection of stuffed birds, coins, precious stones, and geological specimens; a public library of 10,000 vols.; a monthly magazine; and 3 insurance companies. Its manufactures are important; embracing as leading industries the manufacture of reapers, mowers, paper, flour, cotton batting, seamless bags, and yarn, furniture, woolen goods, malleable iron, pumps, etc. Among the manufactories is a watch factory, with a capital of \$150,000, an oatmeal factory, and works for machine and mill casting.

ROCKINGHAM, a co. in extreme s.e. New Hampshire, adjoining Massachusetts; bounded e. by the Atlantic; drained by the Lamprey and Piscataqua rivers; intersected by the Boston and Maine, the Concord and Portsmouth, and the Manchester and Lawrence railroads; 700 sq. m.; pop. '80, 49,062—45,118 of American birth. The surface is rugged and fairly fertile; corn, potatoes, wheat, hay, dairy products, and maple sugar, are the staples. Co. seats, Portsmouth and Exeter.

ROCKINGHAM, a n. co. of North Carolina, on the Virginia border, intersected by the Richmond and Danville railroad; drained by the Dan and Haw rivers; 600 sq. m.; pop. '80, 21,744. The surface is undulating, and partly covered with forests; the soil is fertile. The principal productions are corn, tobacco, sweet potatoes, honey, butter, and cattle. It contains 12 manufactories of chewing tobacco. Co. seat, Wentworth.

ROCKINGHAM, a co. in n.w. Virginia; drained by the Shenandoah and its branches; traversed by a branch of the Baltimore and Ohio railroad; 750 sq. m.; pop. '80, 29,567—29,368 of American birth; 3,430 colored. The county lies in a valley, and on the s.e. slope of the Blue Ridge mountains; the soil is very rich; tobacco, corn, wheat, oats, and pork are the staples. Co. seat, Harrisonburg.

ROCKINGHAM, CHARLES WATSON WENTWORTH, Marquis of, 1730—82; created earl of Malton in the Irish peerage in 1750. He immediately entered the house of lords.

He was a constitutional whig, and though not a man of marked talent had a great political influence on account of his wealth, his family connection, and his known moderation. He was first lord of the treasury and prime-minister 1765-66, and again from the resignation of lord North in 1782 till his own death. Under his administration the stamp act was repealed; the repeal being joined to an act asserting the power of parliament over the colonies.

ROCKING-STONES, or **LOGGANS**, are large masses of rock so finely poised as to move backward and forward with the slightest impulse. They occur in nearly every country. Some of them appear to be natural, others artificial; the latter seem to have been formed by cutting away a mass of rock round the center-point of its base. The former are chiefly granitic rocks, in which feldspar and porphyry are abundantly present; and these ingredients becoming rapidly decomposed, and the dust and sand washed away by rains, what was formerly a solid rock, soon assumes the appearance of a group of irregularly-shaped pillars, having a rhomboidal horizontal section, and separated into portions by horizontal and vertical fissures. As decay proceeds, the edges of the blocks forming the pillar are first attacked and disappear, as is also the case with greenstone and basalt, and the pillar now becomes a pile of two or more spheroidal rocks, resting one upon the other. Should a mass of rock be so situated as to preserve its equilibrium in spite of the gradual diminution of its base or point of support, a rocking-stone or loggan is the result. For an exposition of the principle regulating the stability of equilibrium of rocking-stones, see **STABILITY**. Various explanations have been given of the uses of these singular objects. They are supposed to have been used in very early times for purposes of divination, the number of vibrations determining the oracle; hence it came to be believed that sanctity was acquired by walking round them.

Some rocking-stones occur near to remains of ancient fortifications, which seems to bear out a statement in one of the poems of Ossian, that the bards walked round the stone singing, and made it move as an oracle of the fate of battle. In Greece, rocking-stones occur as funeral monuments, and are generally found on conspicuous places near the sea. Rocking-stones are numerous in Yorkshire, Derbyshire, Cornwall, and Wales. One near Land's End, in Cornwall, has been computed to weigh no less than 90 tons. Near Warton Crag, Lancashire, are no less than seven of these stones. In Scotland, they occur in the parishes of Kirkmichael, Dron, and Abernethy, Perthshire, and in the parish of Kells, Kirkeudbrightshire. In Ireland they are found in many places; one situated at a place called Islandmagee, on Brown's bay, is popularly believed to acquire a rocking tremulous motion at the approach of sinners and malefactors.

ROCK ISLAND, a co. in n.w. Illinois, bounded on the n.w. by the Mississippi river, drained by Rock river, crossed by the railroads centering at Rock island (q.v.); about 375 sq.m.; pop. '80, 38,315—27,914 of American birth. The surface is somewhat uneven. The soil is fertile. The principal productions are corn, wheat, and live stock. Co. seat, Rock Island.

ROCK ISLAND, a city of Illinois, at the foot of the upper rapids on the Mississippi, opposite Davenport, Iowa, 3 m. above the mouth of Rock river, 181 m. w. by s. of Chicago. The Mississippi is here crossed by a railway bridge, and the island from which the town is named has been selected as the site of a national armory. A dam across a portion of the river gives water-power for many manufactories. Pop. '60, 5,130; '70, 7,890.

ROCK ISLAND (*ante*), the co. seat of Rock Island co., on the Chicago, Rock Island and Pacific, the Chicago and Southwestern, the Peoria and Rock Island, and the Western Union railroads; pop. '80, 11,660. It is opposite the w. end of Rock island, which is a heavily timbered island of about 1000 acres, belonging to the United States, and having an armory and arsenal. The armory is meant to be the central armory of the United States, and will include, when completed, ten immense stone workshops run by the Moline water-power. Some of the workshops are already finished. Rock Island is a railroad center, which, with its situation on the river, makes it the shipping point for the region near. A bridge across the Mississippi here was erected at a cost of about \$1,300,000. The upper rapids run from 3 m. below to 16 m. above Moline. The great dam at that point furnishes a water-power said to be equal to the combined water-power of New England. The manufacturing interests are important and rapidly growing. Among them are lumber-mills, cotton-mills, breweries, machine-shops, foundries, manufactories of glass, tools, etc. Rock Island has schools, churches, banks, 5 newspapers, a Swedish Lutheran college, etc.

ROCKLAND, a co. in s.e. New York, bordered on the e. by Tappan bay, a part of the Hudson river, on the s.w. by New Jersey; crossed by the New York, Lake Erie and Western, and the Northern New Jersey railroads; intersected by the Ramapo and Hackensack rivers, which rise here; 208 sq.m.; pop. '80, 27,690. The surface is mountainous, and the soil fertile. The Ramapo mountains in the w. part are bleak and barren, with some elevations of 1000 ft.; in the e. the Highlands extend along the Hudson. Granite, gneiss, limestone, and red sandstone are found here, the latter being extensively quarried for building purposes. Brick and lime are manufactured, and the agricultural interests are small; hay, butter, and corn are the main productions. Co. seat, Clarkstown.

ROCKLAND, a t. in Maine, on the w. side of Penobscot bay, 40 m. s.e. of Augusta. It has a broad and deep harbor, and 80 lime-kilns, making 1,200,000 casks of lime yearly, chiefly shipped to Boston and New York. Its commerce employs 18 ships, 40 barks and brigs, and 150 schooners. It has 3 banks, 2 newspapers, 8 churches, etc. Pop. '60, 7,316; in '70, 7,074.

ROCKLAND (*ante*), co. seat of Knox co., Me., on the Knox and Lincoln railroad, 40 m. s.e. of Augusta. Shipbuilding is extensively carried on. Among the manufactures are boots and shoes, carriages, harnesses, machinery, and tools. A government building for a custom-house and post-office was erected in 1874-75. Water is brought 2½ m. by a costly system of water-works. There is a court-house and a public library. The city was set off from Thomaston in 1848 as East Thomaston, took its present name in 1850, and became a city in 1854.

ROCKLAND LAKE, a beautiful sheet of water in Rockland co., N. Y., 30 m. n. of New York city, 1 m. from the Hudson, and 160 ft. above its surface. It is celebrated for furnishing 200,000 tons of pure ice, annually harvested by about 1000 men, for the supply of New York, and for export.

ROCKLING, *Motella*, a genus of fishes of the cod and haddock family (*gadidae*), having an elongated body, compressed toward the tail; the first dorsal fin very slightly elevated, and very delicate; the second dorsal and the anal fins long, continued almost to the tail fin. Several species are found on the British coasts, and are distinguished among other things by the number of their barbules, three, four, or five. The largest of them is never more than 19 or 20 in. long; the smallest, the MACKEREL MIDGE (*M. glauca*), only about an inch and a quarter. None of the species is much regarded by fishermen, one reason being that decomposition takes place very rapidly after they are taken out of the water, although, when quite fresh, they are not bad for the table.

ROCK-OIL. See NAPHTHA.

ROCKPORT, a t. in Essex co., Mass., on the Gloucester branch of the Eastern railroad; pop. '70, 4,480. It has churches, schools, a newspaper, banks, hotels, and a public library. There are granite quarries. The chief occupations are fishing and farming. Pigeon Cove, a summer resort, is in Rockport.

ROCK RIVER rises in the south-eastern portion of Wisconsin, and runs s.w. into Illinois, thence s.w., and empties itself into the Mississippi 3 m. below Rock Island. Its course of 200 m. is through one of the most beautiful and fertile regions in the world, known as the "Rock River Country." Its frequent falls give abundant water-power, and it is crossed by 12 lines of railway.

ROCK-ROSE. See CISTUS.

ROCK-SALT is common salt (chloride of sodium) occurring as a mineral and in a solid form. It is always mixed with various impurities. It is found massive or crystallized, its crystals generally cubes, its masses very often either granular or fibrous. It is white, gray, or, owing to the presence of impurities, more rarely red, violet, blue, or striped. For its chemical and other qualities, see SALT. It is a very extensively-diffused mineral, and in some places forms great rock and even mountain masses. A hill of rock-salt near Montserrat, in Spain, is 500 ft. high. The island of Ormuz, in the Persian gulf, is formed of rock-salt. The Indus, in the upper part of its course, forces its way through hills of rock-salt, rising in cliffs 100 ft. above the river. In many parts of the world rock-salt is found in beds under the soil or other rocks. Those of Cheshire in England are particularly celebrated, as at present yielding almost all the salt used in Britain, great part of which is pumped from them in the form of brine. Part is also obtained by mining, as at Northwich. The mines of Wieliczka in Poland are of great extent. The workings are at depths varying from 200 to 740 ft., and the salt at the deepest working is the purest. Some of the chambers in the mines are said to be 300 ft. high. Blasting by gunpowder is often necessary in the mining operations. The mines give employment to 1200 or 1400 workmen; and they have been wrought for centuries. Vast quantities of rock-salt occur in many parts of Asia, Africa, and America. In Carmania and Arabia, rock-salt is sometimes used for building houses, the dryness of the climate rendering its solubility unimportant.—The salt which crystallizes on the margins and bottoms of salt lakes may be regarded as a variety of rock-salt. Concerning the salt of the ocean, the salt found in many desert regions as an effervescence on the ground or on rocks, the salt with which sandstone and other rocks are impregnated, etc., see SALT.

ROCK-SOAP, a mineral consisting of silica, alumina, peroxide of iron, and water, the silica nearly one-half, the alumina and the water sometimes nearly each one-fourth of the whole. It is earthy, easily broken, black or nearly so, very soft, and easily cut with a knife, is greasy to the touch, and adheres strongly to the tongue. It is valued by painters for crayons. It is found in a number of places on the continent of Europe, and occurs in trap rocks in the isle of Skye. It is only found massive.

ROCKVILLE, a village in Vernon, Tolland co., Conn., on a branch of the New York and New England, and a branch of the Connecticut Central railroads; pop. '70, about 5,000. It has churches, schools, hotels, a newspaper, gas and water works. There are several woolen-mills and other factories, for which, the water power is furnished by Hockanum river.

ROCKWALL, a co. in n.e. Texas, drained by branches of the Sabine and Trinity rivers; about 200 sq.m.; pop. '80, 2,984—2,952 of American birth. The surface is mostly rolling prairie. The soil is fertile. The principal productions are wheat and corn. Co. seat, Rockwall.

ROCK-WORK, an ornamental structure often introduced into gardens, for the cultivation of plants such as grow on or amongst rocks. It is made of rough blocks of stone rudely piled together, with earth, etc. Simple as it seems, it is very difficult of construction: and too often, after much expense, it has a paltry and ridiculous appearance.

ROCKY MOUNTAINS, that portion of the great ranges of mountains in the central and western portions of North America which lies in the United States and British possessions, a continuation of the Cordilleras of Mexico, between the Pacific ocean and 105° w. long., and reaching from Mexico to the Arctic ocean. In the United States the Rocky mountains extend over a breadth of 1000 m., and cover an area of 980,000 sq. miles. From lat. 32° to 40° n., the ranges bear nearly n. and s.; between lat. 40° and 45° n., their course is n.w.; then, after a more northerly bend, they keep a course nearly parallel to that of the Pacific, with many detached ranges and peaks, one of which, mount Elias, lat. 61° n., long. 141° w., is 17,800 ft. high, and marks the boundary-line of longitude between Alaska and the British possessions. Mount Shasta, in the coast-range in North California, is 14,000 ft. high; Fremont's peak, near the western boundary of Wyoming, and the sources of the Yellowstone and Colorado rivers, is 13,570 feet. In British Columbia, mount Brown, lat. 53°, is 16,000 ft.; and mount Hooker, 15,700 feet. The passes have elevations of 6,000 to 7,000 ft., and a vast territory is from 4,000 to 5,000 ft. above the level of the sea. The central range of the Rocky mountains forms the ridge which divides the rivers that fall into the Pacific from those that fall into the Arctic ocean, Hudson's bay, and the gulf of Mexico, and whose head-waters are often interlocked; but between the eastern and western ranges lie the territory of Utah and the state of Nevada, in which are large rivers having no other outlets than lakes, generally salt, as Great Salt lake in Utah, and Humboldt's lake, the outlet of Humboldt's river, in Nevada. The tops of the higher ranges are covered with perpetual snow, and their lower regions about with artemesias, odoriferous plants, and sunflowers. The rocks are metamorphic gneiss, granites, porphyries, mica and talcose slates, and gold-bearing quartz, with deposits of mercury, silver, carboniferous limestone, coal, and petroleum. Anthracite has been found near the gold-mines of Santa Fé, and copper in New Mexico.

ROCKY MOUNTAINS (*ante*). Explorations and surveys of the vast extent of elevated plateaus, and the many separate ranges of this mountain system, have been made by the U. S. government with exceeding thoroughness. Colorado, Wyoming, New Mexico, and Utah, with the portion of the range which traverses them, have nearly complete scientific surveys, including their topographical and geologic features. The parts of the range in Idaho, Montana, Wyoming, Oregon, and Washington territories are less advanced in their surveys, which are still in progress. The first comprehensive exploration of this central part of the continent was made by capt. Lewis and Clarke in 1803-6 under the direction of president Jefferson, in connection with their exploration of the upper Missouri and the Columbia rivers. Maj. Z. M. Pike in 1805-7 traversed the plains to Pike's peak (named after him), discovered the head-waters of the Arkansas in the heart of the range in Colorado, and crossed into the great basin on the w. side of the range. In 1819-23 col. S. H. Long was sent with a party to make a scientific survey of the same region; the peak n.w. of Denver was named in his honor. The real first explorers of all the great interior parts of the continent were the hunters and trappers employed by the British and American fur companies, the latter operating from St. Louis. The most extensive explorations by any one scientific party, however, were made in the three expeditions led by col. John C. Fremont under government authority. The first in the winter of 1842-43 made a survey of the South pass and discovered the Wind River mountains, the highest peak of which Fremont ascended and measured, and it received his name. The second expedition started in May, 1843, and explored the route by Bridger's pass over the mountains, located the Great Basin of Salt lake, and crossed to the Columbia river, returning by the way of the Great Basin. In 1846 gen. P. Kearney traversed the Rocky mountains with a military party to California, and returned overland in 1847. Fremont's last explorations were in 1848 up the Rio Grande from Santa Fé and thence across the great chain w. to the Great Basin. In 1853 the government ordered extensive surveys in the Rocky mountain country, the results of which are contained in 13 vols. of maps and reports. These were the bases of the support given by the government to the construction of the Union Pacific railway 1866-70. The U. S. scientific surveys completed and in progress, under the direction of prof. Hayden, I. W. Powell, Clarence King, and other able scientists, will be almost unequalled in their completeness. The search for the precious metals also fills the region with an advance corps of unscientific explorers.

The vastness of area of the Rocky mountains, their erratic and widely separated ranges, spurs, and groups of mountains, and the extent of the great plateaus at high elevations, impress the mind far more than their picturesqueness or scenic character. The Andes in South America form a much loftier and narrower chain. Persons familiar with them, or with the Alps, find the scenery of the Rocky mountains relatively tame. Travelers by the Union Pacific railway which gains the first continental divide

at Bridger's "pass," at an altitude of 7,000 ft., are astonished to see a broad rolling gravelly plain stretching away on all sides, and the mountains forming the horizon apparently of no great height. Rising from a base of plains 4,000 to 6,000 ft. above the sea, the mountains only begin at those levels.

The Rocky mountains are the summit divide of North America, and a continuation of the chain of the Andes of South America. At the isthmus of Darien, sinking to a minimum elevation of 100 ft. above the sea, they increase in height northward through Central America, where their well-watered summits, on the Pacific side in Costa Rica, have the most delightful of climates. In Guatemala they rise into the volcanic elevations of Fuego and Agua, 13,000 and 14,000 ft. high respectively; and thence into Mexico, where, in lat. 19°, the chain is 300 m. wide and rises into the loftiest elevations of the continent, in a chain of mountains running e. and w., forming the volcanoes of Popocatepetl, 17,540 ft.; Orizaba, 17,176 ft.; Toluca, 16,610 ft.; and Iztaccihuatl, 15,705 feet. North of this loftiest part, between the eastern and the western declivities of the great mountain mass, is the plateau of Mexico, a comparatively level plain from 3,000 to 6,000 ft. above the sea (averaging 5,000 ft.) extending from the city of Mexico 1200 m. northerly to the United States line, of a width varying from 200 to 500 miles. See MEXICO. The highest part, or main chain, where it enters the United States from western Chihuahua, is known as the Sierra Madre, and is there 180 m. in breadth, of purely mountain country, the highest parts of which are about 8,000 ft. above the sea. The eastern slopes are well-watered and fertile. Cotton and the grape are grown on the lower parts. The Sierra Madre mountains spread into a number of branching ranges in Arizona, difficult to classify; nowhere rising into mountains of so great height as in southern Mexico or Colorado, and forming elevated plateaus of a more irregular character than those of Mexico. The easterly side of the chain where it enters New Mexico has an altitude of from 6,000 to 8,000 ft., increasing northwardly to the Colorado line, near the source of the Rio Grande, where many peaks rise to 14,000 feet. Through Colorado the range maintains a grand elevation. Here the U. S. surveys have been most elaborate, and the attention given to the country by the discoveries of great numbers of mines, and ready access afforded by railways, have made this state the most noted for the study of the mountains. See COLORADO. The streams which flow e. to the Mississippi and s.w. to the gulf of California rise in snow-covered ranges inclosing a system of "parks" which have given the name of "the park system" to this part of the Rocky mountains. It is bounded n. by the Laramie plain, e. by the great plains, w. by the cañon-rifted plateaus of the Colorado, and on the s. merges into the valley of the upper Rio Grande. North park is the basin of the head streams of the North fork of the Platte; Middle park is the basin of the sources of Blue river (the North fork of Grand river) flowing to the Colorado; South park is the basin of the springs of the South Platte, and one of the head streams of the Arkansas; and San Luis park the basin at the source of the Rio Grande. All these parks lie at elevations from 5,000 to 7,000 ft. above the sea, and gather the drainage of the snowy ranges to carry them to the gulf of Mexico on the e. and the gulf of California on the west. For geologic and topographical surveys of this region see COLORADO and NEW MEXICO. The easterly range in view from Denver is called the Colorado range; its continuation n. forms the Medicine Bow range; w. of the Middle and North parks is the Park range. The Colorado range by a westward trend connects at mount Lincoln with the Park range, and divides North park from Middle park. The Park range, which lies nearest to the great plateaus of the head-waters of the Colorado w. of Middle park, becomes a middle range further s., and lies e. of the upper valley of the Arkansas. A third range, having its n. head in the mountain of the Holy Cross, becomes the westerly range. Its n. parts take the name Sawatch range, and the southern the San Juan range. It has more elevations reaching to 14,000 ft. than any other part of the Rocky mountains in the United States. South of the Sawatch range the country is broken into great mountain masses too isolated to suggest a range. The Pike's peak group is the most north-easterly group of this character. The following table gives the altitudes of the main elevations of these ranges:

	Feet.		Feet.
Gray's peak, Colorado range.....	14,341	Mount Chavano, Sawatch range....	14,093
Torrey's peak, " ".....	14,336	Castle peak, Elk mountain range... 14,115	
Mount Evans, " ".....	14,330	Capital mountain, " " ... 13,977	
Long's peak, " ".....	14,271	Snowmass " " " ... 13,970	
Mount Guyot, " ".....	13,565	Pyramid peak, " " " ... 13,885	
Mount Lincoln, Park, " ".....	14,297	Greenhorn Mt., Wet Mt. " ... 12,230	
Buffalo peak, " ".....	13,541	Garland peak, Sangre de Christo	
Mount Powell, " ".....	13,398	range.....	14,300
Pike's peak	14,147	Crestone, Sangre de Christo range..	14,233
Mount Harvard, Sawatch range....	14,375	Mount Thomas, Sierra Blanca range	11,496
Mount Elbert, " ".....	14,351	Mount Wilson, San Juan mountains	14,280
La Plata, " ".....	14,311	Unkarpagri, " " " " ..	14,235
Massim mountain, " ".....	14,298	Mount Sniffles, " " " " ..	14,158
Mount Autoro, " ".....	14,245	Mount Eolus, " " " " ..	14,054
Mount Princeton, " ".....	14,196	Handie's peak, " " " " ..	13,997
Mount Yale, " ".....	14,187	Rio Grande pyramid, " " " " ..	13,773
Holy Cross mountain, " ".....	14,176	Mount Osa, " " " " ..	13,640

North of Colorado and on the line of the Union Pacific railway, there is a relatively low part of the great chain, which was formerly known by the names of its lowest points, as South pass, Bridger's pass, etc. The Union Pacific railway took the latter. The Black hills are the most easterly outlying spur of the range n. of these passes. The main chain trends n.w., and spreads over an area 300 m. wide in Wyoming; its easterly ranges in the w. part of that territory taking the names Big Horn mountains and Wind River mountains. The greatest elevation and some of the most picturesque parts of the range are at the Three Tetons, near the w. line of Wyoming, s. of the National park at the head of the Yellowstone. See NATIONAL PARK OF THE YELLOWSTONE. On the n. side of the Snake river, in Idaho, the range develops a volcanic character up to recent times. Isolated and exceedingly irregular and lofty uplifts fill the whole of central Idaho, and nearly all of Montana. (See those territories.) South of the great valley through which the Union Pacific railway is laid there are the lofty and isolated ranges named Wahsatch and Uinta. The former is the most abrupt elevation on the eastern border of the great basin. Its western slopes drain into the Jordan river and Great Salt lake, and its eastern slopes into the Colorado. Its greatest elevations, Twin peaks, Lone peak, and mount Nebo, are about 12,000 ft. above the sea, and as their summits are not more than 20 m. from the valley of the Jordan, 4,500 ft. above the sea, they form a peculiar group which arrests and attracts the moisture from the air currents of those regions and concentrates upon their heads an amount of snow-fall in the winter greater than upon any other part of the Rocky mountain in the United States. Near the sources of the streams that empty into the Jordan the avalanches and snow-slides are more frequent and dangerous than elsewhere. The Uinta mountains is a range or mountain mass connecting the Wahsatch with the main ranges east.

North of the United States the range is supposed to have an equal breadth of ramification, and its elevations are greater. Mounts Hooker and Brown, 300 m. n.w. of Idaho, have an altitude of 15,700 and 16,000 ft. respectively. The range is thence northward continuously lofty, and forms the westerly wall of Mackenzie's river, flowing into the Arctic sea, but is pierced in several places by streams rising w. of the range, and emptying either into that river or into streams that flow into Hudson's bay.

Some authors name all the mountains between the basin of the Mississippi and the Pacific as portions of the Rocky mountains, and classify them into park ranges, basin ranges, plateaus, Sierras of Nevada, Coast range, and Cascade mountains. The three latter ranges have no more reason to be included with the Rocky mountains than the Alleghanies. The uplift beginning in the Pacific ocean, and forming the peninsula of Lower California, continues northward into the lofty Sierras of Nevada, the Cascade mountains in Oregon and Washington, and through Alaska to mount St. Elias, 16,758 ft. high, near the shore of the n. Pacific. In the Sierras of California, mounts Shasta, Tyndall, and many others are upward of 14,000 ft. high; and mounts Jefferson and Hood in Oregon territory, mounts Rainier and Baker in Washington territory, are still higher. This great range is distinctly separated from the Rocky mountain system by the valley of the Colorado river, the great interior basins, and the valleys of the upper Columbia, Fraser, and Yukon rivers. For the geology, natural history, topographical, and climatic details of the Rocky mountain system, see the states and territories traversed by them. For Pacific coast ranges see CALIFORNIA, OREGON, WASHINGTON, and ALASKA.

ROCO'CO, a name given to the very debased style of architecture and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. This style prevailed in Germany and Belgium during last century, and in France during the time of Henry IV.

ROCROI, a small t. of France, in the dep. of Ardennes, 15 m. n.w. of Mézières, is a fortress of the fourth class, and is situated in a fine, extensive plain, bounded on all sides by the forest of Ardennes. Pop. 76, 1052. It is memorable for the victory gained by the great Condé (then duke of Enghien) over the Spaniards, May 19, 1643. The Spanish army was composed of veteran bands of Walloons, Spaniards, and Italians; and their general, Don Francisco de Mellos, the governor of the Low Countries, was a commander worthy of his army. The French (25,000) were also good troops; but their general, Condé, was a young and inexperienced officer. At first the battle was unfavorable to the French, but at last the Spaniards were thrown into irretrievable rout. The count of Fuentes, the commander of the redoubtable infantry, and 10,000 of his men, were among the slain; and 5,000 men, with all the cannon, many standards, and the baton of the count de Mellos, were captured. But, far beyond all material losses, the renown of invincibility, first acquired by the Spanish infantry on the field of Pavia (1525), and confirmed at St. Quentin, Gravelines, and Prague, was destroyed.

ROD, called also a *pole*, or *linear perch*, a measure of length of $5\frac{1}{2}$ yards, or $16\frac{1}{2}$ feet. The square rod, called generally a *rood*, is employed in estimating masonry, and contains $16\frac{1}{2} \times 16\frac{1}{2}$, or $272\frac{1}{4}$ square feet.

RODEN TIA (Lat. gnawers), or **RODENTS**, in the system of Cuvier, an order of mammalia, almost exactly corresponding with the *glîres* of Linnæus. The order is a truly natural one, and is therefore universally recognized by naturalists. The rodentia are small quadrupeds; the largest of them—the capybara—not being equal in size to a hog,

while to this order belong the smallest of mammalia. They are very numerous, and widely distributed over the globe, particularly abundant in South America, and rarest in Australia. They are all remarkably characterized by their front teeth, variously regarded as incisors and canines—the true incisors or canines being absent—which are large and of peculiar structure, two in each jaw, and separated by a considerable vacant interval from the molars. The front teeth have a plate of hard enamel in front, which wears more slowly than the substance of the rest of the tooth, so that being employed on hard substances, they acquire a chisel-like form, and unlike the teeth of mammals in general, they are always growing from a fresh pulp at the base, so that compensation is made for the wearing away at the tips; but when a tooth is accidentally destroyed, the opposite tooth continuing to grow, sometimes acquires a monstrous shape and size, from which cause rats and other rodents have been known to die, the enormous tooth preventing the eating of food, or even recurving and piercing the skull. The ordinary food of most rodents consists of vegetable substances, and generally of a pretty hard kind, and their front teeth are adapted for comminuting it by gnawing, and are also used for gnawing wood, the shells of nuts, etc., in order to obtain access to food. The molar teeth have flat crowns, having ridges of enamel, which make them more or less tuberculous; and these are in the line of the jaw, while the only horizontal motion of which the lower jaw is capable is forward and backward, thus making the ridges of the molar teeth powerful instruments for the reduction of hard substances; the jaws also being in general very strong. In the rodents which eat only vegetable food, the molar teeth have rounded tubercles; while in the omnivorous kind—as rats—the tubercles become sharp points. The stomach is simple; the intestines are very long; the cæcum is often large, sometimes larger than the stomach itself. The brain is not large, and is nearly smooth, and without convolutions; the rodents are not generally distinguished for sagacity, although some of them—as the beaver—exhibit remarkable instincts. Most of them may be easily tamed, but few of them seem capable of learning anything, and in general they merely acquire a familiarity with man. Of this the rabbit exhibits a very perfect example, although the rat seems to display a far higher intelligence. The eyes are directed laterally. The rodents very generally have the hinder limbs larger than the fore, and their motion is partly a kind of leaping. In some, this is as completely the case as in kangaroos. Some, as squirrels, have an admirable power of climbing trees; and a few, as beavers and water-voles, are aquatic. Most, if not all, have the habit of sitting on their haunches, and holding their food to their mouth by their fore-paws; using both paws together, however, as the fore-feet have not at all the character of a hand. The thumb is never opposable to the other toes; sometimes it is rudimentary or wanting. The bones of the fore-leg are generally separate, but have not so much freedom of motion as in the *carnivora*. The toes are terminated by claws. The presence or absence of clavicles (collar-bones) divides the order into two sections, to the first of which, having clavicles, belong squirrels, mice, rats, voles, the beaver, etc.; and to the second, without clavicles, belong porcupines, civies, chinchillas, hares, rabbits, etc. The rodents are very numerous, about 400 species being known.

RODERIC, the last king of the Visigoths in Spain, whose tragic downfall, coincident with that of the Visigothic monarchy, has inspired poets and romancers (including historians) to throw round him a halo of glory. The Spanish and Arab historians contradict each other in almost every particular of Roderic's life—the latter, on the whole, being apparently the more trustworthy. According to them, Roderic was of humble birth, but rose, through his talent and bravery, to the command of the cavalry. A conspiracy having been formed against Witiza, the reigning monarch, by the clergy and the nobles of Roman blood, Roderic was elevated to the throne in 709, and by his energy and talent soon quelled all opposition. The sons of Witiza, however, joined with some malcontent Visigothic nobles—among whom was count Julian—and agreed to summon to their assistance the Arab chief, Muza ibn Nozeir, who had just finished the conquest of Mauritania. The Spanish writers, on the other hand, assert that the country groaned under the tyrannical government of Roderic, that his licentious behavior had disgusted many of his nobles, and that the people were ripe for a revolution when the Moslem invasion took place. Both are agreed as to the time and mode of the invasion; but the Arab historians brand count Julian with the most atrocious treachery, as not only voluntarily surrendering Ceuta, the key of the country, but actually guiding the 13,000 Berbers and Arabs under Tarik into Spain. A landing was effected at Algesiras, April 28, 711; and in spite of vigorous opposition from the governor of Andalusia, Tarik marched on, routing Roderic's chosen cavalry, which had been sent to oppose him. Roderic, who had been employed in another quarter, now hastened at the head of an army, which is variously estimated at from 50,000 to 100,000 men, to oppose the daring invaders, who by this time had been so re-enforced from Africa and by rebels that their numbers amounted to 25,000. The two armies met on the banks of the Gaudalete, near Xeres de la Frontera, and on July 17, the battle commenced. Roderic directed the center of his army in person, appointing the sons of Witiza to command the wings, and the battle raged furiously for three days; a single combat then took place between Roderic and Tarik—a kind of statement extremely frequent in eastern histories—in which the former was slain, and his head cut off, to be embalmed and sent to Muza. The Christians, enraged

at the loss of their chief, fought furiously during six days longer, but all in vain, for victory now declared itself decisively in favor of the Moslems, to whom the sons of Witiza had deserted soon after the commencement of the contest, and the rout of Roderic's army was complete. The most ancient Spanish chroniclers agree in asserting that Roderic either died on the field or sunk in the Guadalete, whilst attempting to save himself by swimming his horse across; and the various stories of his escape and subsequent adventures are of much later date. This decisive victory laid all central and southern Spain at the feet of the Arabs. Roderic has been made the hero of an epic poem by Southey.

RODEZ, a small t. of France, capital of the department of Aveyron, stands on the crest and slope of a hill, on the n. bank of the Aveyron. Its streets are steep, narrow, winding, and dirty; but the promenades around the town are pleasant. The cathedral, with a clock-tower of great height, is a Gothic structure of the 15th century. A variety of woolen cloths are manufactured, and cheese of a highly esteemed quality is made. Pop. '76, 12,881.

RODGERS, C. RAYMOND P., b. N. Y. 1818; entered the navy as midshipman 1833; rose through successive grades to commodore, 1870. He was in the Mexican war; on the coast survey in 1850, and 1856-58; commandant in the naval academy 1859-61. In 1861-62 he commanded the flagship *Wabash*, s. Atlantic squadron. He was on active duty at the battle of Port Royal and fort Pulaski, in the expedition to St. Augustine and St. Mary's river. He was fleet capt. of the s. Atlantic blockade squadron 1863, commanded the steamer *Iroquois* 1864-65, the frigate *Franklin* in the European squadron 1869; and in 1871 was appointed chief of the bureau of docks and yards.

RODGERS, JOHN, 1771-1838; b. Md.; entered the naval service in 1798 as a lieutenant, and was executive officer of the frigate *Constellation* under com. Truxton at the time the French frigate *L'Insurgente* was seized off Nevis, Feb., 1799. For his brave conduct in this action, he was promoted to a captaincy, took command of the *Maryland* and cruised near the West India station. In June, 1803, he commanded the *John Adams*, and with the assistance rendered by the *Enterprise*, made a successful attack on a cruiser with 22 guns, and also on other vessels at anchor near Tripoli. In 1804 he commanded the *Congress* at Tripoli in the squadron fighting under com. Barron, whom he succeeded in 1805. After peace was declared he sailed to Tunis accompanied by his squadron, and was successful in establishing friendly relations with its authorities. In 1811, while on the *President*, off Annapolis, hearing that a man had been forced into service on a British frigate then at Sandy Hook, he sailed at once for that point, and finding a man-of-war there hailed her; after some time an answer was given followed by a shot, and a short engagement ensued in which the British vessel, *Little Belt*, was much injured. Com. Rodgers discovering the crippled condition of his opponent, ceased firing and boarded the vessel, offering assistance, which was declined. The account given of this action by the commanders differed widely, and added to the breach then existing between the British and the Americans. In 1812, war being declared against Great Britain by the United States, com. Rodgers was placed in command of a squadron stationed near New York, and discovering the British ship *Belvidere*, chased her, and a running fight followed, in which capt. Byron (British) was wounded, and com. Rodgers also, the latter by the bursting of a gun on his own vessel, the *President*. On a cruise soon after he captured a number of British merchantmen, and also the packet *Scallow*, which carried a large amount of specie. In 1814 he was ordered to the command of the new frigate *Guerriere*, and rendered valuable aid in the defense of Baltimore. From 1815 to 1824 he was president of the board of naval commissioners, and in 1823 acting secretary of the navy; from 1824 to 1827 he had command of the squadron in the Mediterranean. After his return he again served as navy commissioner till 1837. At his death, which occurred at Philadelphia, he was senior officer of the navy.

RODGERS, JOHN, b. Md. 1812; entered the navy in 1828, and was made lieutenant in 1840. He served through the Seminole and Mexican wars, and was promoted commander in 1855. He went on an exploring expedition to the n. Pacific 1853-56, and was made capt. in 1862. In the latter year he supervised the construction of some gunboats in the west, led a gunboat expedition up the James river, and in command of the *Galena* attacked fort Darling. In 1863 he commanded the monitor *Weehawken*, and in Warsaw sound fought and captured the strong confederate iron-clad *Atlanta*. He was afterward in command of the Asiatic squadron, and in 1871 bombarded and captured the Korean forts.

RÖDIGER, EMIL, 1801-74; b. Germany. After studying theology at Halle, appointed professor of oriental languages at that university; removed to Berlin in 1860, and resided there for the rest of his life. He published a new edition of Lockman's *Fables* (1830); *Syrische Chrestomathie* (1838); *Hinjaritische Schriftmonumente* (1841). After the death of Gesenius he finished his *Thesaurus Linguae Hebraicae*, and edited his Hebrew grammar from the 13th to the 21st edition (1874).

RODIYAS, a degraded race in Ceylon, who are expelled from society, and live in a condition more abject than that of the Pariahs of India. By some they are thought to be a branch of the Veddalis (q. v.). Under British rule, which does not recognize caste.

the Rodiyas have improved socially, and are no longer disqualified for labor. For many interesting particulars respecting this unfortunate race, see *Ceylon*, by sir J. E. Tennent, vol. ii. p. 191.

RODMAN, THOMAS J., 1818-71; b. Ind.; graduate of West Point, commissioned brev. 2d lieut. of ordnance 1841. He was the inventor of the 15 in. and 20 in. smooth-bore guns made by hollow casting. He was the author of improvements in the manufacture of gunpowder for large pieces, and invented the *mammoth powder* and *perforated cake*. He published (1861) *Reports of Experiments on the Properties of Metal for Cannon*.

RODNEY, CÆSAR, about 1730-83; b. Dover, Del.; son of William, who came over with Penn. He was a signer of the declaration of independence; appointed high sheriff at 28; became a justice of the peace, and judge of the lower courts. In 1765 he was sent to the "stamp act" congress at New York. He was speaker of the house in 1768, and for some years afterward delegate to the general congress, and brig. gen. in 1774. He was active in providing supplies for the state troops in the commencement of the revolutionary war, and was in active service in 1777, commanding a brigade of the Delaware line, near Princeton. Elected to congress in the same year, he was also elected president of the state of Delaware, and chose to accept the latter honor, holding the position four years.

RODNEY, GEORGE BRYDGES RODNEY, Lord, English admiral, b. Feb. 13, 1718, was second son of capt. Rodney of the royal marines. He was taken from Harrow school at the early age of 12, and sent to sea. He became lieut. in 1739; post-capt., 1742; and commander of the Newfoundland station in 1748, with the rank of commodore. In 1752, he returned home, and was elected M.P. for Saltash. He afterward commanded the *Fouquet*, the *Prince George*, and the *Dublin* men-of-war. In 1759, after 28 years' active service, he was made rear-admiral; and in July he bombarded Havre for two or three days, destroying the town and fortifications so effectually, that it has never recovered its former importance as an arsenal for ships-of-war. In 1761 he took Martinique, Grenada, and Santa Lucia. In 1762 he became vice admiral, and in 1764 was made a baronet. In 1779 Spain joined France in the war against England, and their united fleets appeared in the channel in overwhelming force. The siege of Gibraltar was undertaken by the Spaniards; and Rodney, who was sent out with 22 sail of the line and 8 frigates to the West Indian station, was ordered to relieve Gibraltar *en route*. After capturing seven Spanish ships-of-war, he fell in, Jan. 16, 1780, with admiral Langara, off cape St. Vincent, "that promontory which has witnessed more of our battles and triumphs than any other headland in the world." Of the Spanish fleet, five were captured and two destroyed. Having accomplished the relief of Gibraltar and Minorca, he quitted the Mediterranean, and crossed the Atlantic to the station of his command. On April 17 he defeated, near Martinique, the French fleet, under the count de Guichen. Being ill-supported by his captains on this occasion, he complained to the admiralty. The naval administration of the day was, however, so corrupt and rotten, that the admiralty suppressed the criminatory passages of his dispatches, and only one of the accused was brought to trial, the others being allowed to escape from the difficulty of finding a sufficient number of non-delinquent officers to try them. Rodney took Eustafia from the Dutch, with 250 ships and other booty, estimated at three millions sterling. Demerara and Essequibo next surrendered. On April 12, 1782, Rodney, in conjunction with Hood and Drake, encountered the French fleet under De Grasse off Dominica, April 12, 1782. Each fleet consisted of upward of 30 ships of the line. The battle was more obstinately contested than any engagement that ever took place between the two nations, being kept up without intermission for nearly 12 hours. De Grasse was totally defeated, and Rodney lost seven ships of the line and two frigates. Owing to the French vessels being crowded with troops, they are said to have lost 3,000 killed and 6,000 wounded; while the English loss did not exceed 600. On board the *Ville de Paris* were 36 chests of money, to pay the soldiers; and the whole train of artillery was on board the other captured ships. Count de Grasse was himself taken prisoner. His flag-ship, the *Ville de Paris*, of 112 guns, was the only first-rate man-of-war that, up to that date, had ever been taken and carried into port; and De Grasse, when he landed at Portsmouth, was stated to be the first commander-in-chief of a French fleet or army who had been prisoner in England since the capture of marshal Tallard in queen Anne's wars. In this action, Rodney successfully executed the nautical maneuver of breaking the French line, and placing the enemy between two fires, which had fallen into disuse since the commonwealth. Rodney's victory saved Jamaica, ruined the naval power of France and Spain, and gave the finishing blow to the war. The news arrived in England just after an order had been dispatched for the recall of Rodney, whose politics differed from those of the new ministry. He was now elevated to the peerage as baron Rodney, and received a pension of £2,000 per annum for himself and his successors. He lived in retirement for the rest of his life. He died May 21, 1792, leaving behind him the fame of one of the most distinguished commanders in the naval annals of Great Britain. A monument was erected to his memory in St. Paul's cathedral, and his portrait by sir Joshua Reynolds, is among the treasures of Greenwich hospital.

RODOSTO, a t. of European Turkey, in the vilayet of Adrianople, stands on the n. shore of the sea of Marmora, 77 m. w. of Constantinople. It is surrounded by beautiful

gardens, contains many mosques, and sends large quantities of fruits and vegetables to the capital of the empire. Pop. 13,000.

RODRIGUEZ, ALFONSO, 1526-1616; b. Spain. After graduating in theology at the Salamanca college in 1545, he became a Jesuit. He was made instructor in theology at Salamanca, and later was rector of the Monterey college. He was celebrated as an abstruse theologian of the casuists' school. In the latter part of his life he lived at Valladolid, Montilla, and Seville. His works on the *Practice of Christian Perfection* was translated into many languages.

ROE, *Cervus capreolus*, or *Capreolus dorcas*, a species of deer (q.v.) inhabiting Europe and some parts of Asia, chiefly in hilly or mountainous regions either covered with forests or with scattered bushes and heath. It is seldom found in the higher and more naked mountain tracts, the haunt of the stag or red deer. It was once plentiful in Wales and in the hilly parts of England, as well as in the s. of Scotland, but is scarcely now to be seen in any part of Britain s. of Perthshire. It is not long since it was pretty common in some of the wilder parts of the n. of England. The roe is about 2 ft. 3 in. in height at the shoulder. Its weight is about 50 or 60 lbs. Its color is a shining tawny brown in summer, more dull and grizzled in winter, the lower parts and part around the tail white. There is considerable variety in the shade of color. The hair is longer than in many deer. The tail is very short, concealed among the hair. The horns, which are peculiar to the male (the *roebuck*), are 8 or 9 in. long, erect, round, very rough, longitudinally furrowed; having, in mature animals, two tines or branches, which, as well as the tip of the horn, are sharp-pointed, so that the horns of the roe become very dangerous weapons when used for offense. The ears are large. The habits of the roe somewhat approach to those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe with one or two fawns being usually seen together. Contrary to what is usual among deer, the male and female roe remain attached during life. The voice of the roe, resembling that of a sheep, but shorter and more barking, is often heard through the night in regions where it is plentiful. The browsing of the roe is very injurious to young woods, a circumstance which has led to its extirpation in places where it would otherwise have been cherished. It feeds much on the tender shoots of trees and bushes as well as on herbage. The venison is superior to that of the stag, but not equal to that of the fallow-deer. The horns are used for handles of carving-knives, etc. The roe is never very thoroughly tamed, and when partially so, is apt to become mischievous and the male dangerous.—Another species of roe (*cervus* or *capreolus pygargus*), rather larger than the common roe, is found in Tartary.

ROE, EDWARD PAYSON, b. N. Y., 1838; studied at Williams college and at Auburn theological seminary. In 1862 he was appointed chaplain of the 2d N. Y. light cavalry, and was two years in the field, when president Lincoln appointed him chaplain of the fortress Monroe hospitals. At the close of the war he accepted a call from the Presbyterian church at Highland Falls, N. Y. In 1872 he published his first story, *Barriers Burnt Away*, which achieved an immediate popular success, which was followed by a like result on the publication of other works of fiction of a similar general character. In 1874 he removed to Cornwall-on-the-Hudson, and from that period has devoted himself to a literary life. He has written *What Can She do?*; *Opening a Chestnut Burr*; *From Jest to Earnest*; and other stories. In 1873 he published a horticultural work, entitled *Play and Profit in my Garden*; and in 1881, *Success with Small Fruits*, an illustrated volume which has been translated into the French and Japanese languages. More than 250,000 copies of his books have been sold in the United States; and they have been reprinted in England, and translated into German.

ROEBLING, JOHN AUGUSTUS, 1806-69; b. Germany; studied civil engineering at the polytechnic school of Berlin, and at his graduation read a thesis on suspension bridges, a branch of his profession to which he devoted himself. In 1831 he came to America and settled near Pittsburg, Penn. He was made assistant engineer on the slack-water navigation of the Beaver. After receiving similar engagements in other places, he was appointed to survey the route across the Alleghenies adopted by the Pennsylvania Central railroad. He then commenced the manufacture of wire rope, and in 1844 replaced the wooden aqueduct of the Pennsylvania canal across Allegheny river by a suspension aqueduct, completed in May, 1845. Afterward he constructed the Monongahela suspension bridge at Pittsburg, and from 1848-50 four suspension aqueducts on the Delaware and Hudson canal. He established his works at Trenton, N. J., and in 1851 commenced the great suspension bridge at Niagara river. In 1867 he began the Cincinnati suspension bridge, which has a clear span of 1057 feet. His last enterprise was the bridge across the East river, connecting Brooklyn and New York. The designs were completed and work had begun on the bridge when Mr. Roebling died from the result of an injury he received in 1869 while directing the construction. He published *Long and Short Span Bridges* (1869). He has been succeeded by his son Washington A. Roebling, who has since devoted himself to the construction of the East river bridge.

ROEBUCK, JOHN ARTHUR, English politician, was b. at Madras in 1801, but passed his youth in Canada. At the age of 23 he came to England, and was called to the bar at the Inner temple in 1831. He challenged the suffrages of the electors of Bath as a radical reformer in 1832, and represented that city until 1837. He was again elected in 1841, and held his seat until the general election (1847). In May, 1849, he was returned for Sheffield, which he represented till 1868; and for which he was again returned in 1874. In 1835, when the executive government of Canada and the house of assembly of lower Canada were at variance, the latter body appointed Roebuck their paid agent in England—a position which involved him in a serious quarrel with the press. He was next the central figure of a parliamentary “scene,” on the occasion of a too plentiful crop of election petitions and election compromises subsequent upon a general election. He made out such a case that, in defiance alike of whigs and tories, he obtained a committee to inquire into election compromises. His next great appearance was at the meeting of parliament in Jan., 1855, when he gave notice of a motion for inquiring into the condition of the army before Sebastopol. To the undisguised joy of the nation, Roebuck carried his motion by an immense majority, and the administration of the earl of Aberdeen was shattered to pieces. The Sebastopol committee sat, and the inquiry exercised great influence in the subsequent reconstruction of the war department, and the reorganization of our military, commissariat, and medical systems. In 1855 he became a candidate for the chairmanship of the Metropolitan board of works, with a salary of £1500 per annum, but was only third on the poll. On the annexation of Savoy and Nice in 1860 Roebuck indulged in the sharpest invective against the emperor Napoleon. He became a director of the Galway steam-packet company, and offended his constituents by defending a contract which they regarded as savoring of a political job. He went to Vienna to obtain some commercial concessions for a company with which he was connected, and returned with strong pro-Austrian sympathies, volunteering a defense of Austrian rule in Venetia, which jarred upon public feeling. During the civil war in America he displayed a strong leaning toward the cause of the confederates. In the debate on the war between Germany and Denmark, Roebuck declared (1864) that the English fleet ought to have been sent to defend Denmark. He warmly supported the earl of Beaconsfield’s policy during the Eastern crisis in 1877–78, and in 1878 was made a member of the privy council. Roebuck is fearless and unmeasured in attack, not too charitable in his judgments, fond of personalities, but is regarded as an honest and true-hearted Englishman. He is the author of a work on the *Colonies of England*, the *History of the Whig Ministry of 1830*, and in his earlier years contributed much to the *Westminster* and *Edinburgh Reviews*.

ROEMER, OLAVS, or OLE, 1644–1710; b. Jutland, Denmark; educated at the Copenhagen university. He accompanied Picard to France and was appointed tutor to the dauphin by Louis XIV. He became eminent in astronomy and mathematics and was made a member of the academy of sciences in 1672. He was an associate of Picard and Cassini in many investigations and discoveries. Roemer was the first to measure the velocity of light by the eclipses of the satellites of Jupiter. In 1681 he returned to Denmark as professor of astronomy at Copenhagen, held several public positions, and finally became chancellor of the exchequer. The results of his scientific work were published by Horrebow in 1753 under the title of *Basis Astronomiæ*.

ROERMOND (Fr. Ruremonde, called also by old writers Godswaard [i.e., God’s island] op de Maas), an old but lively t. in the Netherlands, province of Limburg, at the junction of the Roer and the Maas. A suburb called St. Jacob is connected with Roermonde by a beautiful stone bridge over the Roer. The cathedral is one of the handsomest churches in the Netherlands. Pop. ’75, 9,609, about 350 being Protestants, 100 Jews, the remainder Roman Catholics. Principal industries are weaving woolen cloths, cottons, making paper, pipes, wax and tallow candles, cotton-spinning, calico-printing, refining salt, etc. Roermond is said by some authorities to have been the birth-place of the celebrated Mercator, others claiming the honor for Rupelmonde in East Flanders. It has often endured the horrors of being besieged and taken.

ROE-STONE, a name locally given to those limestones which are formed of small globules like the roe of fishes. It has been translated into the scientific term *oolite*, and this is applied to that period in the earth’s geological history in which the limestones with this structure chiefly occur.

ROGATION-DAYS (Lat. *Feriæ Rogationum*), the Monday, Tuesday, and Wednesday before ascension-day, so called because on these days the litanies (q.v.) are appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasion of public danger or calamity is traceable very early in Christian use; but the fixing of the days before ascension for the purpose is ascribed to Mamercus, bishop of Vienne, in the middle of the 5th c., who, on occasion of a threatened earthquake or other public peril in his city, ordered a public procession and prayer, for the purpose of averting the divine anger. The usage being in harmony with the spirit of the times, became general and permanent, and the form of prayer employed is that known as the *Litany of the Saints*. In England, after the reformation, the recitation of the litanies upon these days was discontinued; but a memorial of the old practice long survived in the so-called perambulation of parishes (q.v.).
